The next spring, the little saplings are taken up as soon as the frost is out of the ground, and transplanted in rows two feet apart and five or six inches apart in the rows. These rows are kept well cultivated and the following spring, when the little trees are about two years old, they are ready for the process of grafting or budding.

I follow the system of root grafting with good success. I have no difficulty to get fully ninety per cent to grow.

In root grafting the trees are taken up and the roots are cut into three inch pieces which I graft by clefting. The scions should be cut just when the sap begins to circulate and before the buds swell. These may be buried in earth and kept in good condition for grafting for two or three weeks.

Root grafting has the advantage that if anything should happen the tree above ground and the root is not killed, it will sprout again from the graft and I think the trees are stronger as there is no old wood to grow over.

An interested fruit grower.
Queens Co., N. B.

Perfection.

Michael Angelo, the great Italian sculptor, was once showing a friend the various pieces of work in his studio. The friend pointed to one partly finished piece and remarked that the sculptor had done nothing at it since his last visit. "Oh, yes, I have," he replied. "I have softened the expression; touched up a part here and more fully developed a part there." "Oh!" said his friend, "Those are only trifles." "True," said Michael Angelo, "but trifles make perfection; and perfection is no trifle." The "Perfect" spray pumps, manufactured by R. B. Westhaver, Mahone Bay, N. S., has been improved in every detail, so that they now stand for perfection.

CLEAN CULTIVATION AND COVER CROPS

By Geo. L. Thompson, Berwick, N. S.

DURING a period of eight years we have been supplying our orchards with an annual application of 150 lbs. Muriate of Potash and from 300 to 500 pounds of Acid Phosphate or Basic Slag per acre. Weekly cultivation with spring tooth harrow from beginning of May or thereabouts to about the end of June, when cover crops, either tares or crimson clover, was sown. Orchards ploughed in the fall.

Thinking that the cover crops did not supply sufficient nitrogen, in the spring of last season, we applied about 200 pounds Nitrate of Soda per acre and discarded the potash and Phosphoric Acid. The foliage was very much benefited by this application of Soda, and the apples, especially Baldwins and Nonpareils seemed to be larger.

From 230 bearing trees we have obtained the following yield of apples:—

Year	Barrels tree run
1900	122
1901	168
1902	127
1903	301
1904	229
1905	283
1906	332
1907	594
1908	401
1909	681
1910	183*
1911	1000
1912	600

*Frost at blossoming time.

I imagine that these figures may be considered fairly satisfactory. Now, what I should like to see discussed is, whether or not a good average production can be maintained without the use of Potash and Phosphoric Acid, and depend simply on cover crops, supklemented when the cover crop is not good, by a small application of nitrogen fertilizer the following spring.

Some time ago when reading U. S. Farmers' Bulletin, No. 257, I came across the following remarks by Prof. Whitney:—

"In all soils there are rock particles or minerals containing phosphoric acid and potash, and in all the soil solutions that we have ever examined (and we have examined hundreds of them from all parts of the country) the composition and concentration of the soil moisture which is the nutrient solution spread throughout the surface soil of the earth for plants to grow in and to gather their food from, is sensibly the same. These minerals are difficultly soluble, but they are appreciably soluble. They are soluble enough to maintain a solution which is amply sufficient for the plants to gather their food from." Farther on in the bulletin he states that "The humus, apart from the physical effect it has in loosening up the soil and the absorbing effect it has in holding water, which may greatly increase the yield of crops, appears to be the form of sewage disposal for the crops."

Prof. M. Cumming, in an interesting article, (Report 1910) states that: "Humus is the principal source from which plants obtain nitrogen, it contains a considerable portion of the other elements essential to plant growth. It improves the texture of soils, and conserves the water supply, besides it is the medium in which countless species of microscopic life live, and, by their process, unlock the abundant treasures of fertility stored up in the inert rock mass-soil."

Prof. F. T. Shutt in a late Montreal paper states that "The important functions of humus—physical, chemical and biological, are only beginning to be realized by our farmers. As an outcome, however, of investigatory work there is one fact that must not be lightly passed over. It is that the percentage of nitrogen, under ordinary circumstances, is a direct index of a soil's fertility, that nitrogen is the most important, the dominant, the limiting factor determining crop production. This is not to be understood as minimizing the importance of the other elements of plant food furnished by the soil but rather as emphasizing the unique place which soil nitrogen holds and the necessity for its up-keep. In this connection there is the comforting fact that in rational, economic methods of enriching a soil in nitrogen we have the opportunity, constantly as it were, of keeping up a goodly supply of available phosphoric acid, potash and lime, and in preserving a favorable physical condition of the soil."

Clean Culture in J. Elliott Smith's Orchard, Wolfville, N. S.

Young Orchard Intercropped With Corn on the Farm of W. W. Pinneo, Watervill e, N. S.

From March 8th issue of the "Rural New Yorker" I notice the following:—

Prof. Paddock of the Ohio Agricultural College says: "Probably the best scheme ever devised for handling the majority of orchard soils, where the lay of the land will permit, is by combination of clean cultivation with cover crops. This method includes the plowing of the land as early in the season as the weather will permit. The plow is followed at intervals by the harrow in order that the surface of the soil may be kept mellow throughout the growing season. Usually in the latter part of July a crop of some kind is planted, and this is allowed to occupy the land until the next spring."

In recent issues of the "Country Gentleman" Wm. C. G. Hopkins places a good deal of stress on the value of using fine ground natural rock phosphate as one of the agents to produce increased crop yields.

In Dominion Experimental Report for 1910 under the head of 'Special Experiments with Fertilizers' the following occurs:—

"When these experiments were planned, the opinion was very generally held that untreated mineral phosphate, if very finely ground, was a valuable fertilizer which gradually gave up its phosphoric acid for the promotion of plant growth. Many years' experience has shown that mineral phosphate, untreated, is practically of no value as a fertilizer." Again, "after ten years' experience had demonstrated that finely ground, untreated mineral phosphate was of no value as a fertilizer, its use was discontinued in 1898."

At the present time I am inclined to think that if I can yearly plow in a good heavy crop of clover in my orchard, no other fertilizers will be neccessary. In the case, however, of a light catch of clover, a small application of nitrogen fertilizer may be advisable. On the other hand, would good heavy applications of Potash and Phosphoric Acid increase the yield of apples to such an extent as would over-balance the increased expenditure? My own experiments in this line on different rows of trees, did not seem to indicate that the extra fertilizer gave an increase of apples.

SPRAYING.

Although I obtained fairly satisfactory results last season from the use of Lime-Sulphur and Lead Arsenate, (54 per cent. No. 1 apples), I have an impression that it will pay me better to spray with Bordeaux when the buds are swelling and just before the blossoms open, subsequent sprayings with Lime-Sulphur. The 'Canadian Countryman' for Dec. 21st contains the summary of a New Hampshire Experiment Station bulletin. I quote as follows:—

"No fungicide has been found that holds disease in check as well as Bordeaux. When showers follow soon after an application of Bordeaux the leaves are likely to be spotted and the fruit russeted by the fungicide. The injury to the fruit is seldom great enough to be of importance when the apples are sold in barrels.

No commercial Bordeaux has been found that is as satisfactory as the home-made. A 3.3:50 Bordeaux (3.3.-40 Canadian measure) is the most desirable for use in the apple orchard. Lime-Sulphur has in most cases proven a satisfactory substitute for Bordeaux. It has caused little or no injury, and in some seasons has controlled the diseases as well as Bordeaux. The results of 1910 showed that two sprayings of lime-sulphur were entirely inadequate to hold scab in check.

When the diseases are serious and the season a rainy one, more application of lime-sulphur will be required than of Bordeaux. The number of sprayings required will vary greatly with the season, with the disease in question, and with the general care of the orchard. The application of a strong fungicide before the leaves are out, and of one of regular strength just before the flower buds open, will decrease the number of sprayings needed later."

By spraying with Bordeaux when buds are swelling, just before the blossoms open, and subsequently with lime-sulphur. Would russeting of fruit be liable to follow?

PRUNING.

Thinning out the branches to keep the tree open for admission of sunshine, or,

Clipping the ends of the twigs all over the tree, like a man having his hair cut.

Which is the best method so far as producing pleaty of well coloured fruit is concerned? I would like to know.

Boys Enjoy Grafting.

When only a little boy my grandfather taught me to graft. He had several trees, that produced inferior fruit and I was turned loose on these. The scions I used were all of valuable varieties, some of them imported from Europe. What joy I took in converting those trees to careers of usefulness only the boys or the girls who have had a similar play can know. As I now remember it, more than 90 per cent. grew and the trees all became useful citizens in the orchard.—M. G. Kains.

Agricultural Conditions in Kingston Parish, N. B.

One of the Best Market Garden Sections in the Province

By A. R. Wetmore, Sec. Agricultural Society, Clifton, N. B.

PROBABLY there are few agricultural sections in New Brunswick in which will be found such a combination of farm practices as in the parish of Kingston, Kings Co. This parish, situated between the St. John and Kennebecasis rivers, is naturally rough and hilly and possesses few farms which are adapted to exclusive dairying or would be suitable for mixed farming on the larger scale. However, these farms, small and hilly though they be, are very suitable for vegetable gardening, the raising of small fruits, poultry raising and dairying in a small way. It has been said that a farmer, taken from some one of the large, fertile and more easily worked tracts in another part of the province and placed upon one of these farms, would find it somewhat embarassing to carry out his farm practices under the different conditions. However, we, who have been brought up under these conditions, have adapted ourselves to them and have carried on the methods of farming which we believe to be most suitable.

The development of agriculture in this section may be practically traced back to the coming of the Loyalists. Some might wonder how those hardy forefathers found courage to carve out homes in this, as it must have been, a rough wilderness. Perhaps it was the natural beauty that attracted them and when this is considered the wonder grows less. However, man cannot live by scenery alone, and this must have been recognized by those men who first cleared the land and began tilling it. It is on these farms, started by those men in the past, that we are living and farming to-day.

AGRICULTURAL SOCIETY.

The Kingston Agricultural Society was one of the first started in the province and it has been one of the largest and perhaps one of the most successful. This society in the purchase of commercial fertilizers, good seed and pure-bred stock has done much to promote agricultural interests in this locality.

COMMERCIAL FERTILIZER

Owing to the fact that considerable work s done in vegetable gardening and comparatively little done in the keeping of live stock in this section, it has been necessary to maintain the fertility of the land. The Agricultural Society, for years past, has purchased the unmixed fertilizers and these materials have been sold to the members at cost price plus the cost of handling. The members are thus enabled to make a saving in the purchase price and also to know what they are getting. The following are the prices paid for the various fertilizers this year:

Sulphate of Potash, per ton, ... $51.90
Nitrate of Soda, per ton 58.00
Bone Black, per ton, ... 23.00
Acid Phosphate, per ton, ...lb 19.00
Muriate of Potash, per ton, ... 46.00
Sulphate of Ammonia, per ton, 73.00
Basic Slag, per ton 13.00

Another advantage of buying the unmixed fertilizers is that combinations suitable to the requirements of different crops may be made up. The following are combinations in use among the farmers in this section:

GRASS OR GRAIN MIXTURE.

Bone Black or Acid
Phosphate .... 50 lbs.
Sulphate of Ammonia ..... 15 lbs.
Muriate of Potash or Sulphate of Potash .... 12 lbs.

Iris Beds on the Experimental Farm Gardens, Charlottetown, P. E. I.

A Harvesting Scene on the Farm of W. W. Pinneo, Waterville, N S.

GRASS OR GRAIN MIXTURE.

Bone Black or Acid
Phosphate .... 45 lbs.
Nitrate of Soda .... 20 lbs.
Muriate of Potash .... 12 lbs.

FRUIT AND LIME MIXTURE.

Bone Black or Acid
Phosphate .... 50 lbs.
Muriate of Potaosh .... 20 lbs.
Nitrate of Soda .... 12 lbs.

These complete fertilizers are sold to the members of the Society:—
where Bone Black is used at $32.60 per ton.
where Acid Phosphate is used at $31.00 per ton.

During the past year the society handled 160 tons of commercial fertilizer.

DAIRYING.

Dairying is carried on on a small scale throughout the parish. The Agricultural Society has given encouragement to the improvement of the dairy cattle both by purchasing pure-bred animals and by giving a bonus to individuals purchasing such stock. This year our Society has purchased and sold at auction to the members seven pure-bred Jersey animals which we hope will make an impression on the stock. Our pastures are, for the most part, rough and hilly and we find the Ayrshire and Jersey breeds of cattle most suitable to our conditions.

We are, as a whole, in need of improvement in our methods of feeding the dairy cows. During this summer we would do well to supplement our pastures with soiling crops such as oats and peas, green corn and green clover, and during the winter we are in need of a balanced ration. It has been the general practice to feed during the winter: hay, middling and a few roots. This does not seem to meet all the requirements of the dairy cow and it would seem that the following rations would be an improvement.

Mixed hay .... 12 lbs.
Roots, Turnips and Mangels 20 lbs.
Grain, Bran-4; Corn Meal-3; Oil Cake -2; Cotton seed Meal-2; 8 to 10 lbs.

SMALL FRUITS.

In 1867 the industry of growing small fruits was started in Clifton by D. P. Wetmore; strawberries, raspberries, currants and gooseberries. Strawberries were cultivated more plentifully than any other of the fruits and were the first grown in the province as a business crop. Strawberry culture in Clifton has lately become somewhat less but it is a live and profitable business throughout the whole parish and elsewhere in the province. The general practice followed with this crop is to take two crops and then plough out. The net profit from an acre varies from $200 to $400.00.

VEGETABLE GARDENING

In the cultivation of early vegetables for the market in St. John we have perhaps our main source of livlihood. Rhubarb, early potatoes, turnips, peas, beans and in fact all kinds of vegetables are grown in this locality. There are perhaps few sections in the province as suitable for the growing of early produce as it is along the banks of the St. John and Kennebecasis in this parish. In summer, our shipping facilities are quite suitable for this work as we have the steamboats on both rivers which furnish a reasonable means of transportation.

POULTRY RAISING.

There is no one in the vicinity specializing in poultry raising but practically all do a little in that line. Generally speaking this branch is found to be profitable. Barred Plymouth Rocks and Rhode Island Reds are considered the most suitable breeds.

While we do not specialize in any one of these branches, we have, by the combination, our source of income. We do not perhaps handle as much money in a year as many farmers in other sections but it is quite probable that at the end of the year our profits are equal to the profits made by those other farmers.

Budded vs. Grafted Stock.

Editor Maritime Farmer:—

My orchard is in Westmorland Co., New Brunswick, near Port Elgin and was only set out last spring. I believe it is the first orchard ever set out on a commercial scale in that part of the country. So you see horticulture is something not far remote from new down here. If you can do some missionary work for the cause of horticulture down here through the medium of your Special Spring number your efforts will be highly appreciated. Many of my friends laugh at the idea of setting out an orchard down here on a commercial basis.

I had Mr. Turney, the Provincial Horticulturist down to examine this section for horticultural possibilities and his opinion was that we have a soil and climate equal, if not superior to that on the St. John river for fruit growing.

I planted 200 apple trees last spring and I intend to continue similar plantings for the next two or three years.

I may say that the trees have made an encouraging growth. I measured some of the season's growth in November and found new wood varying from eighteen to twenty-eight inches in length.

My business keeps me in Amherst most of the time so my orchard plantings at Port Elgin are only carried on as a side line. However, I expect to give the side line more time in the future than I have in the past. In my interest in horticulture, Mr. G. Sidale, of Port Elgin, is my only sympathizer in the district. He tells me that he intends to set out a large orchard. Nearly ever farmer in the district has a small orchard for home use and wherever the trees are proper-

(Continued on page 501)

The Use of Fertilization in Apple Orchards

An Address by Dr. Stewart, of the Pennsylvania State College, Before the Recent Nova Scotia Fruit Growers' Association.

THE proper fertilization of an orchard is largely a local problem. It is no less a problem, however, because it is local. The same is true to a marked extent, of many other orchard operations, not excepting cultural methods. It is true that of late it has become a fashion among horticulturists to assume that the whole truth is known about cultural methods, that there is but one proper method for orchards and that all growers who do not follow it are either shiftless or ignorant. But the fact is, that even with cultural methods, the practice found best for one particular soil or location, or for one age of orchard or fruit effect, is by no means certain to be best for all others or even best for the adjacent farm. In general, therefore, it appears that there are at the present time, comparatively few horticultural principles or practices which are really exact and general in their application. Most of them seem to be quite subject to important exceptions and hence they usually require some local modification or adjustment, if the best results are to be secured.

So it is with orchard fertilization. We know that it is likely to be important and we can now give approximate general directions for it. But when we come to the actual fertilization of a particular orchard, some local tests and adjustments are usually desirable.

Warehouses of United Fruit Companies, Berwick, N. S.

The First Carload of Box Apples Shipped From Kentville, N. S., by Hillcrest Orchards.

THE AMOUNTS OF PLANT FOOD ACTUALLY TAKEN UP BY A MATURE ORCHARD.

That there is an important need for fertility in any orchard that is actively producing and growing, there can be no reasonable doubt. The actual extent of this need can be approximated chemically by determining the average composition of apple wood, leaves and fruit, and applying these figures to what may be considered good annual amounts of these three products. This we have done both for apples and for a 25-bushel crop of wheat, with the results shown in Table 1. The annual weights for apples are based on a yearly production of 100 pounds each of wood and leaves and 14 bushels of apples per mature tree. All these amounts are distinctly less than those actually observed and reported, but inasmuch as they give an annual yield of 490 bushels per acre of 35 trees, they are considered sufficient for the present purpose.

TABLE I. RELATIVE PLANT FOOD DRAFT OF WHEAT AND APPLES.
(In lbs. per acre annually, based on American and German Averages.)

	Wheat Grain	Wheat Total	Wood Lb.	Leaves Lb.	Fruit Lb.	Apple Total Lbs.
Annual Weights	1500	4200	3500	3500	24500	31500
Nitrogen (N)	30.0	43.7	11.3	25.6	16.2	53.1
Phos. Acid (P_2O_5)	10.0	15.8	3.6	5.3	6.4	15.3
Potash (K_2O)	9.8	26.8	6.6	15.9	41.5	64.0
Lime (CaO)	0.84	8.0	29.1	29.5	3.0	61.6
Magnesia (MgO)	3.0	6.1	4.4	8.9	3.4	16.7
Iron (FeO)	....	....	0.5	1.5	0.8	2.8

In the first place it will be noted that in total food draft, the apples exceed the 25-bushel wheat crop in every constituent except phosphoric acid, and in it they fall behind only by half of a pound. Notwithstanding this fact the trees are usually able to maintain themselves much better and longer than wheat. This is probably largely due to their much longer season of root activity, their more natural demands, the annual return of most of the plant food in their leaves, and their ability to curtail production for one or more seasons when conditions become unfavorable. Without going into details, however, it is quite evident that very important amounts of plant food are annually removed by an apple orchard. Scarcely any soil can furnish all these materials indefinitely in the amounts and times required, and unless proper assistance is rendered, there must come a time when production is materially reduced and off-seasons occur.

It is also interesting to note the relatively large amounts of nitrogen, potash and lime, and the comparatively small amount of iron annually taken up by the apples. Nearly all the lime remains in the wood and leaves, while a large production of the potash is found in the fruit.

1. This is especially marked in the case of the fruit as compared with the demands of the grain in wheat. For further discussion see article by the writer in the Annual Report of the Pennsylvania State College for 1910-11, pages 447 to 449.

This large amount of lime seems to have some significance, so far as the wood is concerned, as shown later, in most of our experiments, its application has improved the growth. In view of the small amount of lime required by the fruit, however, its application should not be expected to materially affect the yields, and this corresponds with our field results. Moreover, the total effect of adding lime alone is surprisingly small, in comparison with the relatively large amounts that are taken up. Either these amounts are merely drawn in and deposited mechanically by the transpiration stream, and hence are largely without physiological significance, or else the average soil is still able to supply the lime needed.

With iron the case is very similar. This element is almost universally present in agricultural soils and the total amount required is so small that its addition can scarcely be expected to produce any important effect. This also is borne out by such experimental results as are now available.

From the large amount of potash carried by the fruit, one might suppose that its addition to the soil would be very important in improving yields, and this idea has been widely proclaimed, especially by those considering only the chemical composition of the fruit. As indicated later, however, it seems that most orchard soils are already sufficiently supplied with potash in available forms and that the chief shortages occur in the nitrogen and phosphates. This is the case notwithstanding the fact that the latter materials are actually required in considering smaller amounts.

From these facts it is evident that there is comparatively little relation between response and requirements in the case of plant food and that something more than a knowledge of the chemical composition of the fruit and wood is needed before one can properly fertilize an orchard. Even with the additional knowledge of the composition of the soil, the problem is not much simplified because it is impossible as yet to duplicate sufficiently the conditions existing in any soil.

A chemist may determine the total amounts of plant food present, but he can not yet determine their actual availability to the trees with sufficient accuracy to be of much value. The practical and proper fertilization of an orchard, therefore, becomes an experimental problem, and its solution is dependent primarily upon the pomologist or horticulturist. In other words, the question is not so much what amounts of plant food are annually taken up, nor what amounts are present, but rather it is what responses are made when certain kinds and quantities of plant food are actually added to an orchard soil.

It is to get light on the latter question in connection with ten different types of soil that we have been working at the Pennsylvania Station since 1907. Altogether, in the case of apples, we have ten experiments on bearing trees, and two on young trees involving a total of more than 2,800 trees, located in different parts of the state, all of which bear more or less directly upon the present question. For the present, however, we shall call special attention to but three of these experiments, since they bring out most clearly the principals points involved.

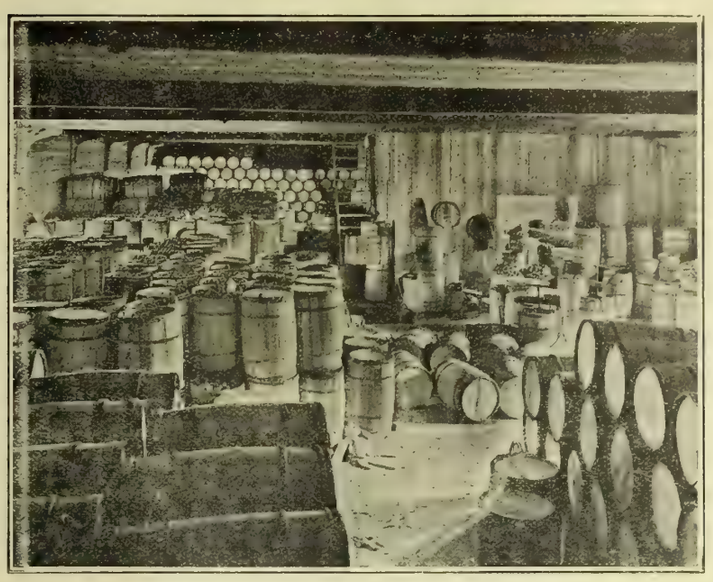
EFFECTS OF PLANT FOOD ADDITIONS TO ORCHARDS.

Some of the effects of adding plant food to orchards are shown in Table 11. This table gives the yield obtained during the past five years in a 10-plot experiment with Baldwins, now 24 years of age located on a Volusia silt loam in Lawrence County, notth of Pittsburg. In estimating the influence of the treatments, the yields of the first year are excluded because they can never be materially affected by the application of the first season. The yields are given in pounds, and also in bushels per acre annually for the last four years.

In the first place, it will be noted that the checks, or unfertilized plots, have run fairly uniform, producing an average annual yield of 174.2 bushels per acre during the last four years. Lime alone (at the rate of 1,000 lbs. per acre annually) has shown no improvement over the average check and as a matter of fact it has averaged 8.3 bushels per acre less, a deficit that

is doubtless largely or wholly due to incidental and natural fluctations. The phosphate and potash combination has affected the yield here rather distinctly. This may be at least partdue to a possible advantage in location, as indicated by the fact that its adjacent check is the highest producer among them and is averaging within 64 bushels of the phosphate-potash treatment. The growth on the latter plot, however, is nearly 35 less than the normal unfertilized plot and its general appearance is not appreciably superior to that of the checks. It is evident, therefore, that these trees are still vitally in need of something, although it should be noted that they are receiving the fertilization commonly advised or orchards,—largely on the basis of chemical analysis.

This need is being quite thoroughly met on the adjacent plot 6, which differs from number 5 only in the addition of nitrogen. The mere addition of nitrogen in this case has more than tripled the gain. Wherever nitrogen appears in the treatments very large yields are observed, and the foliage and growth of the trees are very satisfactory—the average gains



Packing Room, Port William's Fruit Company.

and the results of that season are excluded in the present table for reasons stated above. The results for the past five operative years are given in Table III.

In general we have the same type of results here as in the preceding experiment—large gains from nitrogen, phosphates and manure, with relatively small effects from potash, and again no advantage at all from lime. There are greater irregularities in this experiment, owing somewhat to its greater size, but chiefly due to the presence of a woods on the mountain side above the first check plot, from which the latter is separated by a single row of trees. The leachings from the floor of that woods have acted much like a nitrogenous fertilizer, and as a result, the trees nearest the woods, although of the same age as those farther down, are considerably larger, thus accounting for the greater yields of the first 2 or 3 plots. This influence practically disappears however, by the time the fourth plot is reached, as shown by its low yields—those of a typical check.

The difference observed in the last two columns are due partly to these

TABLE II. INFLUENCE OF FERTILIZATION ON YIELD (JOHNSTON ORCHARD.)
(Yields in pounds and bushels per acre; 1908-1912.)

The annual gains over their normal "production" are indicated in plots 2 and 3. Their annua yields were 564.5 and 391 bushels per acre respectively. The average check omitting No. 1 was 3200 lbs. per plot or 90.16 bu. per acre annually.

in trunk-girth ranging from 25 to 905

Plot 2, receiving nitrogen and phosphate only, at the present time shows a better gain than number 6, which received potash in addition. This is directly connected with the almost complete crop-failure that occurred on the latter plot this last season, and it is also doubtless partly attributable again to natural fluctuations in yield. It shows, however, that no additional potash is needed in this orchard, so far as yields are concerned.

Phosphates are next in importance to nitrogen here, as indicated by the 42 bushel average deficit that occurs on plot 3 as compared with number 6, when phosphorus is omitted in the former, and also by the high yields on number 2. Manure, as a result of the extra large crop of 1912, when most of the other plots were having an off-season, is now in the lead in this experiment with the tremendous average yield of 637 bushels per acre annually for the past four years. This gives an annual gain over the check of 463 bushels per acre, which is a very satisfactory exchange for 12 tons of manure. This benefit from manure is doubtless largely due to its nitrogen content, the proof of which becomes more evident later.

TIME REQUIRED FOR RESULTS TO APPEAR.—It is a common impression that long times are required to determine the value and kind of fertilizer needed for an orchard. It will be noted here and in the following experiment, however, that both these facts were thoroughly evident in the season immdeiately following the one in which the fertilizers were first applied. In other words, both the value of fertilization and the kind of fertilizer needed were clearly evident in these two cases within a single year after the first application, and the conclusions formulated then have not been materially changed by the results of the 4 or 5 additional years that we now have. In most cases, also, where these facts did not appear in the first two or three seasons of bearing they have not appeared in the five or six years now available. This is of special importance in connection with the local tests recommended later, though in them we advise at least 3 years of trial, for the sake of a wider margin of safety and greater stability in the resulting conclusions.

Packing Room at Hillcrest Orchards, Kentville, N. S.

RESULTS FROM THE BROWN ORCHARD.

This experiment is located in Bedford County on DeKalb stony loam, a residual foot-hill soil, chiefly of sandstone origin which is commonly used for orchard purposes. The trees in this case are York Imperial, now 24 years old. It involves the same treatments as these in the Johnston orchard and four others besides—those in plots 6, 9, 11 and 12— also was started a year earlier, in 1907,

irregularities, partly to a certain amount of leaching and cross feeding on the part of some of the checks in spite of separation rows below each treated plot, and partly to a different method of calculation. In one column the benefit is figured on the basis of the normal production of the immediate plot concerned, which method is supposed to eliminate soil irregularities to the greatest possible extent. When the adjacent checks are being benefited by leachings or cross-feeding, however, this method fails to show the full benefit due to the treatment. This failure is especially evident in plot 6 which shows an apparent negative influence in the "normal" column and a positive influence of ten bushels per acre annually in the column based on the average check. The apparent negative influence is due directly to extra yields in the adjacent check plot 7 which is apparently receiving some benefit from plot 8 as a result of cross-feeding. The same thing appears in the negative figures shown by plots 11 and 12 though they are not entirely eliminated by using the average check as the average check as the basis. The average check, however, is not entirely free from the cross-feeding influences, since it only distributes the extra yields and hence it is probable that the negative figures on plots 11, 12 and 15 of the last column merely indicate that these materials have no definite influence when applied by themselves, and the further deficits are attributable simply to natural fluctuations.

Returning now to the results themselves, and especially to those treatments not included in the preceding experiments, we may note first that

the muriate of potash in plot 5 has given much better gains than the sulphate in the adjacent plot. This is contrary to the results of the Massachusetts Experiment, but similar results are now being shown in all of our experiments wherever this comparison occurs. Hence the differences in the Massachusetts experiment would seem to be due to something other than the difference in potash carriers. At present, therefore, we believe that the muriate is at least as efficient as the sulphate and in view of the facts that it is cheaper, more soluble, and much less subject to "caking" in the mixtures, we are using and recommending it for apples.

In plots 11 and 12, and other similarly treated plots in our experiments we see the apparent futility of attempting to materially improve yields by applying phosphates alone. This is not due to the fact that phosphates are not needed, nor can it be largely attributable to the absence of cultivation as may be seen by comparing the results in plots 9 and 2. Nitrogen, by itself in No. 9, shows an annual gain of 96 per cent. or 113 bushels per acre, but when Phosphorus is added in plot 2, these benefits are more than doubled.

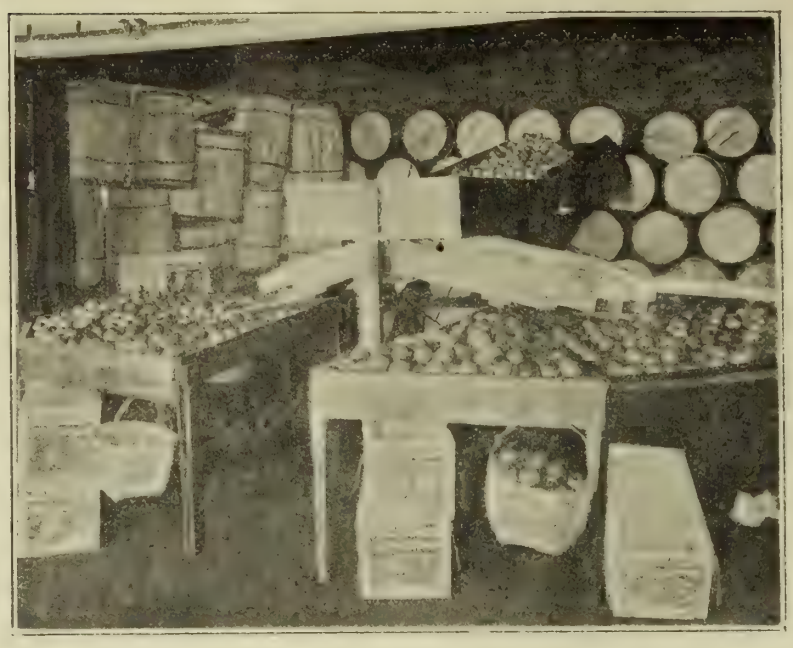
Phosphorus, as usual, therefore, appears to be next in importance after nitrogen in improving yields.

THE PERMANENCE OF FERTILIZER INFLUENCE.—It is another fairly common impression that the influence of fertilizers is transient and that, even where their effect is favorable at first, this effect soon wears out and may leave the soil worse than before. This evidently depends very largely on the character of the fertilization, and in this respect apples are not different from other crops. If the gains are induced by some caustic action of such materials as gypsum or lime when used alone, this may actually be the final result.

On the other hand it should be noted here that in plots 2, 3 and 8 where definite plant foods are being supplied, the effects of fertilization were greater than ever before in 1912, the sixth year of the experiment. The steadiness and regularity of the increases, also, are especially notable in plot 8, which shows a distinct gain in every year except 1909, and in that year the yield would have been fully 1000 lbs. greater had there been sufficient moisture available to properly mature the fruits that were actually present.

In plots 2 and 3, the fertilization has not been complete and also the yields have been so large in the even-numbered years that it was impossible to prevent some alternation with lighter crops in the odd years. This same general condition is evident to a considerable extent in the Johnston orchard. In other experiments, however, and especially in one primarily on cultural methods in the Fassett orchard, with proper fertilization and with crops ranging between 300 and 600 bushels per acre, we have had steady increases on Baldwins and Spies similar to those in plot 8, which extended over a period of five years before any decrease appeared.

The unusual size of the 1912 crops on plots 2 and 3 in the Brown experiments should also be noted. While their adjacent checks 1 and 4, were showing an average yield of 73.2 bushels per acre, plots 2 and 3 were producing the tremendous average of 1217.5 bushels per acre, and 1006 bushels of this were picked fruit. The terminal twig-growth of the checks, also, would scarcely average half an inch for the season, while that of the fertilized plots in spite of their enormous crops, averaged from 6 to 8 inches with frequent terminals running up to 2 feet. And all these differences were brought about solely as a result of differences in fertilization.



Apple Grading Machine in the Waterville Fruit Company's Warehouse, Waterville, N. S. The Only Machine of its Kind in the Province.

Cherry-Picking in Hillcrest Orchards, Kentville, N. S.

The spraying, pruning, soil management, variety and age of trees, and all other visible features were just the same on the checks as on the fertilized plots.

RESULTS IN THE TYSON ORCHARD.

In the two preceding experiments, we have seen very large annual gains resulting from certain fertilization, particularly that rich in nitrogen and phosphorus, regardless of whether these elements were carried in manure or in commercial forms. In these cases, also, the gains from potash were relatively small or entirely absent. Thus far in the Pyson experiment, so far as yields are concerned, we have practically the reverse conditions.

The trees in the latter experiment are much younger, being now but 14 years of age, The varieties are York Imperial and Stayman Winesap, the latter having been top-worked on certain York rows about 6 years after planting. The soil is a relatively heavy, silt loam, and tillage and annual cover crops have been maintained near the trees practically uniformly since the orchard was started. The annual growth and general appearance of all the trees in this experiment are much better than those of the average check trees in the two preceding experiments, practically no fruit had been borne by these trees, when our experiment was started in 1907, and there has been but one fairly full crop since then—that of 1911. The treatments are the same as in the Brown Experiment and the results are shown in Table IV.

As already indicated, the relative youth of these trees make both their yields and differences much less than those in the preceding experiments. With increasing age, it is probable that some of the results may be different especially in view of the relative growth that is now being made under the different treatments. At present, however, certain facts are of interest.

In the first place, the practical failure here of both manure and nitrogen is quite remarkable. The regular annual application of 12 tons of stable manure, in this case, has resulted in an annual gain of less than 4 bushels of apples per acre. During the same time, nitrogen alone has shown no gain at all, and nitrogen and phosphates, which were so effective in the preceding experiments, here show an annual gain of only 12 bushels per acre—not enought to pay for the treatment.

Potash on the other hand, in direct contrast to its effect in the experiments above, here shows a distinct gain in yield wherever it is applied. The best of these gains—in combination with nitrogen, is only 43 bushels per acre annually, but this is more than a 50 per cent. increase over the normal yield, and it shows a fair profit over the cost of treatment, besides giving over 17 per cent. of an increase in growth. Potash applications therefore, have evidently been of value in this orchard, even when those of manure and nitrogen and phosphates were largely failing.

THE ACTION OF MANURE VS. THAT OF COMMERCIAL FERTILIZERS.—The above facts, taken in connection with those shown in the two earlier experiments, indicate that the plant food action of manure is practically identical with that of a commercial fertilizer rich in nitrogen and phosphates. It also apparently indicates that the potash in the manure may be less readily available than that carried in commercial form. The old controversy over the relative value of manure and commercial fertilizers, therefore, is without any particular significance so far as plant food is concerned. Either type of fertilizer may be successful or either may be a failure depending upon the particular conditions involved.

The manure, however, often has some additional value, due to its mulching effect. This, of course, cannot be duplicated by commercial fertilizers alone, though it may be duplicated by any kind of a mulch, as has been shown, especially in our experiment 339, in Bradford County. The matter of availability also must be often considered and it is for this reason that the relation between manure and nitrigenous fertilizers should be well understood. Besides this, it sometimes happens that large and regular applications of manure result in a distinct increase in the amount of blight, and also in an undue increase in the size of the fruit and in the amount of punky pitting in the latter. In such cases, a reduction in the applications or the partial or complete substitution of a proper commercial fertilizer is desirable.

A SUMMARY OF FERTILIZER INFLUENCES ON APPLES.

It is impossible in the present space to consider all our experiments singly, to the extent done with the three just considered. Before passing to the last stage of our discussion, however it seems desirable to present a very brief summary of the fertilizer in-

fluences shown in six of our experiments, including the three just considered. This summary shows the calculated influences of the various fertilizer elements on the four important characteristics of apples, viz. their yield, color, average size and the amount of wood-growth. The relative values of the different elements during a five-year period in terms of per cents of benefit over the normal results obtained without fertilization, are shown in Table V.

Without going into details it may be noted that in general the same influences that have materially increased the yields have also increased the growth. In other words our best growing plots have as a rule been our best fruiting plots. On sound healthy trees this will generally be the case unless either occurs to an abnormal extent, in which case the other may be somewhat reduced. Mild injuries may also stimulate the yields at the expense of growth.

In Table V. the most marked exception to our rule above appears in the case of the phosphates, especially in the lower section of the table. This may be connected with the fact that the old wood especially is very low in phosphoric acid as shown in Table I, and our present definite growth determinations are based upon increase in trunk-girth alone. On twig-growth however, our observations indicate that phosphate additions have been very helpful, particularly in the Brown orchard. This also tends to bring it in line with our rule above.

THE CONTROL OF AVERAGE SIZE.—So far as fertilization is concerned, manure and potash are the or materials that have consistently benefited size. The manure influence is doubtless very largely due to its mulching or moisture conserving effect, since moisture make up about 84.6 per cent. of this fruit, on th average. The potash influence also, so far as it is a definite benefit, is probably brought about through the same medium, inasmuch as potash is credited with some ability to increase the osmotic power of the cells, thus enabling them to compete more successfully for whatever water is present.

There is also a distinct possibility that the apparent benefit of potash on size may be largely due to the fact that it is associated with much lower yields than the other materials, especially nitrogen. Conversely, the failures to increase size may likewise be due to their association with markedly increased yields.

This brings out the general proposition to which we have called definite attention elsewhere, that with a normal moisture supply the dominant influence controlling size in apples is the number of fruits on the tree, after this number has passed a certain optimum or "critical point." This point, however, is relatively high, our data showing that even on trees up to 15 years of age, little or no correlation appeared until the number of fruit reached 1400 or more per tree. Above this point, proper thinning is the most important means of increasing the size of the fruit. Below it, the size can usually be markedly affected by moisture supply, cultural methods, manure and possibly by fertilizers—especially by those rich in potash. The latter factors may also co-operate in such a way as to materially raise the critical point. In general, however, proper thinning and moisture conservation are the most important means of improving fruit size.

THE CONTROL OF FRUIT COLOR —In Table V. it will be observed that none of the fertilizer treatments has resulted in any marked improvement in color. Slight and irregular benefits are shown by potash and some of the phosphate applications but nothing of any importance. The same is true of iron applications so far as experimental evidence is concerned.

Ontario's in Capt. C. O. Allan's Farm, near Kentville, N. S.

Tile-Draining an Apple Orchard

2. See Table XVIII. in the writer's article in the Annual Report of the Pennsylvania State College for 1910-11, page 435.

3. See article referred to in foot note 2, pages 500-503.

These facts again lead up to the general propositions that color in apples cannot be materially increased by fertilizer applications, and that the red colors of apples are essentially dependent upon maturity and sunlight. Conditions that tend to increase one or both of the latter factors, such as late picking, open prunning, light soils, and sod culture tend to increase the red color. Opposite conditions decrease it.

These propositions make it clear why the nitrates and manure apparantly injure color. It is simply done by retarding maturity and diminishing the available sunlight as a result of the increased density of foliage. To determine the truth of this, in 1911 we left the fruit on the nitrate plots in the Johnston orchard until it had reached approximately the same degree of maturity as that attained by the checks when their fruit had to be picked on account of dropping. The delay required was fully three weeks—from September 29th to October 19, and even then the latter fruit picked much harder than that on the checks, besides showing a much lower percentage of drops. The amount of color on the nitrate plots at the later date was also actually greater by 10 per cent than that shown on the checks at their picking time.

The occasional marked increase on color as a result of spraying is largelainable on similar grounds. The sprays reduce the worminess and thus enable the fruit to remain longer on the tree. It also may reduce somewhat the amount of foliage as a result of spraying injury thus permitting more light to reach the fruit. In general, however, in improving color, chief reliance must be placed on those methods that tend definitely to secure fuller maturity on the tree and to get the maximum amounts of light to the fruit.

APPLYIMG PRESENT DATA TO INDIVIDUAL ORCHARDS.

In the three experiments discussed separately above, it was noted that the materials found most valuable in the first two were practical failures in the 3rd and vice versa. In still others we might show cases where no form af fertilization has yet shown a profit. These and other cases prove conclusively the local nature of the problem. Hence not even the experiments of others can offer more than general advice on the fertilization of a particular orchard.

This advice can doubtless be made more exact after a personal examination of the orchard concerned, by one who is familiar with orchard fertilization work, or it may be done with a greater certainty if the owner will give attention to some of the more important characteristics of orchards needing fertilization. These are best observed in late summer and fall.

In general the characteristics of the orchard that is certainly in need of a fertilizer are those of starvation. They are usually sufficiently familiar to need no extended description. They are found most commonly in the older orchards that have once borne well but no longer are doing so, though still fairly free from important disease or improper drainage. The foliage is sparce and pale in such orchards and the annual twig-growth [illegible] and averages short, often no more than half an inch, and from this it may range up to 2 or 3 inches. In such cases, one can usually apply fertilizers fairly liberally with practical confidence of profits, providing the varieties and other handling are right. Even in such an orchard, however, it is advisable to leave a small typical portion unfertilized to really determine the value of the treatment.

Under opposite conditions, such as obtain in most young orchards or in any orchard that is still growing and fruiting well and retaining green and healthy leaves until late in the season, fertilization is much less likely to show a profit. Even in such cases, however, there is often enough probability of benefit to warrant some trial of fertilization, but only over a relatively small area, and with most of the orchard left unfertilized as a check.

These trials are especially necessary in the intermediate orchards— those on the zone lying between the two extreme types just described. Occasionally this intermediate type of orchard will respond very strongly to fertilization, without necessarily showing the characteristic marks, as is essentially illustrated in the Johnston orchard.

A GENERAL FERTILIZER RECOMMENDED FOR APPLES.

For preliminary use in such cases, and for permanent use on the part of those who are unable to carr- out

(Continued on page 471)

Flowers in the Experimental Gardens Charlottetown

Floral Society Organized

By J. A. Clarke, B. S. A., Supt. P. E. I. Experimental Station

THE Snowdrops and Crocusus unfolded their beautiful buds the last week in April and remained open until the main body of the Tulips and Narcissi were in full bloom. Those bulbs were planted the 13th of October the previous autumn and covered for the winter with a dressing of strawy manure. They brightened the lawns and borders with their brilliant show colours all through May and until the 21st of June.

The perennial Iris, shown in the accompanying illustration came into bloom about the middle of June and were the centre of attraction until the first week in July, when the Paeonies spread their abundant and varied blooms. The latter are shown in the second illustration, and though their stay was comparatively brief, they overshadowed all other flowers for the time being.

A superb showing of perpetual roses, with but a brief intermission in August, bloomed from July until the 10th of October. The perennials mentioned above were all planted in the Spring of 1910; large forest trees were removed to prepare the soil for them, which was not naturally rich. A very moderate amount of manure was applied each year as a top dressing and as a protection to the Tulip bulbs, etc., that were planted in the sgme beds for the winter. CULTIVATION is our watchword for success.

The next illustration shows water Lilies growing in the pond at the Experimental Station. A few roots of five varieties of these plants were obtained from Kentucky in 1910 and were planted in good soil in open baskets; these were sunk with stones in groups in the pond. The Caddice-worm, or May-fly larvae, proved very injurious the first season and the lilies all had to be removed to another pond until late in July when the May fly larvae had hatched out. A long continued drought in 1910 lowered the water much lower than it had been for many years, which, apparently has killed off this pest. The photos shown were taken in June 1912, and show a few of the groups of these beautiful flowers which continued blooming until killed by the frost. Seedling plants came up all over the pond in September 1912, and in a short time the whole surface will probably be covered with pink and yellow and white blooms, as large as Paeonies.

The Sweet Peas made a grand showing among the annual flowers. They began blooming July 7th, and though it was an off-year with many Sweet Pea growers, they bloomed profusely until the fourth of November when hard frost set in. Sweet Peas should be planted early and will withstand ordinary frost. We had the land ridged up the previous fall, and during a mild time about the middle of April, or as soon as the frost came out three or four inches, we stirred the surface with a garden rake one afternoon about 2 o'clock, P. M. when the surface was dry enough to form a mulch. Two days afterwards, while the frost was within five inches of the surface and the soil mucky elsewhere, we harrowed the treated part with the spring-tooth harrow and it worked well; the mulched surface holding the heat so that the frost was out as deep as we had occasion to dig our trenches for manure. Well rotted manure was used and the seed sown in double shallow trenches six inches apart on the top of three long drills. On the 17 of April the seed was sown and, as the plants came up the trenches were filled in, giving the plants a deep-root system. The paths between drills were six feet wide, and we will make them wider yet this year. The illustration shows the vines on wire netting. We put up a web four feet high as soon as the plants were well above ground. As soon as they reached the top of this, another web four feet wide was added to it, and many of the eighty varieties may be seen above the top of the wire. Sweet Pea blooms should be cut continually for the more you give away the more you have.—J. S. Clark, Superintendent.

FLORAL SOCIETY ORGANIZED

"The meeting held on a recent evening in the office of Mr. C. Williams for the purpose of organizing a floral society was well attended.

"Mr. J. A. Clark, Superintendent of the Experimental Station, was called to the chair and Mr. C. Williams was appointed Secretary. The minutes of a meeting held a few evenings previously were read and approved.

"The chairman in explaining the object af the meeting emphasized the importance of such an organization as was proposed, both to the members and to the province, indicating a number of directions in which the activities of such a society might lead, such as beautifying the city, town or rural community, inculcating a love of nature study, teaching the best methods of growing flowers and plants, etc. He also suggested, and the suggestion was deservedly applauded, that through the influence of such a society, the official keepers of the parks and streets of the city might be induced to label the trees so that the children would become familiar with their names and varieties.

The chairman also read a letter from Mr. James D. Stewart, Georgetown, regretting his inability to be present at the meeting and offering to give the organization about to be formed his hearty support and sympathy.

"A wire from Mr. W. S. Louson, who was out of town, also expressed regret at being inavoidably absent and offering to donate a trophy to be awarded as a prize for the best kept garden in Charlottetown, the winner for two seasons to be the owner.

A number of gentlemen spoke including Mr. Walter Jones, Hon. M. McKinnon, Commissioner of Agriculture, Messrs. Alley, Wannacot, Williams, Dr. Pethick and ex-Governor McKinnon.

"On motion it was decided to name the organization "The Floral Association of Prince Edward Island," and the following officers were appointed:—

Hon. President, Hon. Mr. McKinnon; President, Mr. J. A. Clark; Sec.—Treas., Mr. O. Williams; Vice-Pres., Queens, Miss Pearl Taylor; Vice-Pres., Kings, Mrs. D. J. Stewart, Lower Montague; Vice-Pres., Prince, Mrs. R. T. Holman, Summerside; Executive Committee, Messrs. J. D. Stewart, Georgetown; A. Alley, L. A. Haszard, Mrs. C. R. Smallwood, Mrs. J. A. Clark, Mrs. R. Grant, Charlottetown; Mrs. J. E. Wyatt, Summerside; Mrs. John McLean, Souris; Rev. Dr. Gauthier, Palmer Road, Prince County.

"The membership fee was placed at fifty cents and it was decided to hold a floral show during the later part of August: Time and place to be arranged for by the Executive Committee.

"A unanimous vote of thanks was tendered to Mr. W. S. Louson for his generous guft; and the meeting adjourned to meet again at the call of the President."

The Use of Fertilization in Apple Orchards

(Continued from page 469)

such a local test as is shown later, we are now recommending the general fertilizer indicated in Table VI. The fertilizers are stated in amounts per acre rather than in amounts per tree, because of the varying numbers of trees that are planted on an acre. The amount per tree for any particular case are readily obtainable, however, by dividing the present amounts by the given number of trees per acre. With young trees, the amounts may be reduced approximately in proportion to the area covered, making this area correspond with that of the roots so far as possible.

FOR YOUNG ORCHARDS, reduce these amounts in proportion to area covered.

This table means that a fertilizer carrying about 30 lbs. of actual nitrogen, 50 lbs. of actual phosphoric acid (P_2O_5) and 25 to 50 lbs. of actual Potash (K_2O) should be applied on an acre of bearing trees. Where potash is not known to be lacking the smaller amount may be used, or after a little testing it may even be omitted entirely. With the smaller amount of potash the essentials of the present combination are carried in 500 lbs. of a 6-10-5 fertilizer, and with the larger amount they are carried in the same weight of a 6-10-10 fertilizer or its equivalent. In the usual ready mixed fertilizers, the nitrogen is likely to be carried in Ammonium Sulphate with which some liming may be necessary if many applications are made, and especially if leguminous cover crops or permanent covers are desired. In special or in home-made mixtures, the various elements may be carried in any of the materials indicated in the table.

TABLE VI. A GENERAL FERTILIZER FOR APPLE ORCHARDS.
(Amounts per acre for bearing trees.)

Nitrogen 30 lb. (N)	Phosphor. Acid 50 lb. (P_2O_5)	Potash 25 to 50 lbs. (K_2O)
Carried in: 100 lb. Nitrate & 150 lb. d. Blood or in 150 lb. Ammon. Sulphate	Carried in: 350 lb. Acid Pho or in 200 lb. B. Meal or in 300 lb. B. Slag	Carried in: 50 to 100 lbs. Mur. or in 100 to 200 lb. low-grade Sul.

In our work the nitrogen is carried in the combination of nitrate of soda and dried blood indicated in the table. This combination carries about equal amounts of nitrogen in each material, and it thus gives a quick action as well as one that is prolonged well through the season. The nitrogen being the costliest and most active ingredient, requires close watching and possible variations in amount, in order to get the most out of it. It may also be secured, wholly or in part, by the use of stable manure or leguminous plants where carriers indicated in the table we they are available. With the other have very little evidence on their relative value as yet and hence those that are actually least expensive or most convenient should be chosen. All applications should be made annually, subject to the variations indicated below.

TIME AND METHOD OF APPLICATION.

The time of application we believe to be of distinct importance, especially in the case of nitrates. While our evidence on this is by no means complete, yet there are good indications that nitrates can easily be supplied too early in the season and thus be wholly lost to the trees. Other evidence leads to the opinion that distinct harm may result from their application about fruit-setting time, especially in the case of the peach. We feel, therefore, that the nitrates should be applied not earlier than petal-fall in apples, and probably not later than the middle of July. In general about the middle of this period should be very good, though some of our best results have come from applications made as late as the 8th of July.

With the peach in Missouri, Dr. Whitten reports that the time of application is very important and that very large increases in yield have been obtained from moderate quantities of nitrate of soda alone when "applied at the right time." This is considered to be "after the main length growth has taken place in the early summer." Such applications kept the trees from going into the rest period too early, and maintained a green and healthy condition throughout late summer and autumn without renewing the growth in twig-length. It may also be noted that in the English work at the Woburn Experimental Fruit Farm, July applications proved beneficial, while those made in February were of no avail.

An incidental advantage of the delayed application appears in the fact that it gives an opportunity to vary its rate somewhat in accord with the size of the crop set on the trees. When the crop is light, much smaller applications are required, because of the natural tendency of the trees to develop a sufficient number of fruit buds in the off season. Proper utilization of this fact should save much in a series of years, and also enable one to secure the maximum return for the fertilization applied.

In the case of the mineral ingredients, with their lower solubility and slower action, the time of application is less important. Some of the most careful observers in commercial work regularly apply their phosphates and potash in the fall on their peach orchards, and believe that this gives best results. Thus far, however, we have felt that the time of application for the minerals is of relatively little importance, since they are rather quickly fixed in the soil, in any case and they do not leach readily. We, therefore, apply them along with the nitrogen at the time that we consider best for it.

The method of application that we have followed is merely to scatter the fertilizer or manure broadcast over the surface of the ground, taking care not to get it too close to the tree trunk where there are few absorbent roots, and extending the applications well out beyond the spread of the branches. To conform more closely with the distribution of feeding roots, the rate of application is made heaviest in the central part of this area, or in general it is applied heaviest under the outer two-thirds of the spread of the branches. This fertilization may either be left on the surface to be washed in by the rains or it may be harrowed or lightly plowed into the soil. With all this done, it should be remembered that the fertilizer applied in any given season can hardly materially affect the yield of that year, since the fruit buds are formed in the latter part of the preceding season. Important results, therefore, should not be expected before the following season, at the earliest, and as indicated in some of our experiments, they may not appear until considerably later and still prove of value.

APPLES NOT GRAPES
Coming Annapolis County Fruit Growers

Sweet Peas in the Experimental Farm Gardens, Charlottetown, P. E. I.

DETERMINING THE ACTUAL NEEDS OF AN ORCHARD.

The general fertilizer formula indicated above is for use only until the exact needs of the particular orchard can be determined. In other words, it is intended to meet only immediate demands. If in the meantime, one wishes really to answer the question of how to fertilize his own orchard, he can do so by following the plan outlined in Table VII. This plan is especially adapted to the needs of commercial orchardists and to "community" tests on the part of the smaller growers.

TABLE VII.

PLAN FOR LOCAL ORCHARD FERTILIZER TEST.

Pounds for a mature tree in bearing.

1. Check untreated.
2. Niter, 2½ lb.; D. Blood, 3½ lb.; Ac. Phos. 10 lb.
3. Niter, 2½ lb.; D. Blood, 3½ lb.; Potash, 2 lb.
4. Acid Phos. 10 lb.; Potash, 2 lb.
5. Check.
6. Niter 2½ lb. D. Blood, 3½ lb.; Ac. Phos. 10 lb.; Potash 2 lb.
7. Same as VI. plus Lime 12 to 25 lbs.
8. Manure 400 lbs.
9. Check.

This test should be located in a typical part of the orchard, and should include not less than 5 average trees of the same variety and age, in each plot. All the trees should be labeled and carefully measured at a fixed point on the trunk, and definite records of their growth and yields should be kept for at least 3 years. Frequently good indications of the orchard's needs may be obtained in less time than this, as shown above in the Johnston and Brown orchards but at least this amount of time should be allowed and more should be used when necessary.

The same time and methods of application and other precautions should be followed as described above. The materials are indicated here in amount per bearing tree instead of per acre as above and the same reductions should be made for younger trees. In other words if only a third of the ground is to be covered, then only about a third of these amounts should be used, if the rate of application is to be kept within proper bounds.

These general precautions, together with the exercise of proper judgment on the part of the grower, are entirely sufficient to carry this plan to a successful conclusion and definitely settle the fertilizer needs of any ordinary orchard within a few years. If additional rules and precautions are desired, however, they can be found in the Annual Report of the Pennsylvania State College for 1910-11, pages 409-11. In addition, it should be remembered that an orchard may not show the need of a fertilizer when young, but may develop this need later, especially when heavy bearing is reached. This means that the cases that appear negative at one time may often need further tests and observations later.

Progressive Fruit Growers in Carleton County, N. B.

By Tappan Adney, Woodstock, N. B.

C. L. SMITH

NO ONE has been more prominently identified with the varied farming interests of Carleton County than C. L. Smith, Esq., of Woodstock. He was for a number of years President of the Carleton Agricultural Society. He has been a breeder of pure bred stock and like all our advanced farmers he has taken a great interest in orchard matters, but more especially is this true of Mr. Smith. A nephew of of the late F. P. Sharp, almost his first independent work was in the nursery business for Mr. Sharp. In an interview with the farmer representative he stated that Mr. Sharp first aroused his interest in orchards, gave him seeds tp plant, showed him how to graft and made a nursery and with this nursery planted an orchard which he now has. Mr. Smith now owns in all about eleven acres of apple orchard. One of these orchards, at the rear of his farm, has an interesting history. It was planted upwards of a hundred years ago by a great uncle. All orchards were then seedlings. Some of these seedlings bore and still bear very good fruit. Your representative was shown a plate full on the table from one of the old trees, resembling a Wealthy in appearance and not at all an inferior fruit. This was in March. Later on Fameuse were planted.

Of upwards of one hundred trees in this old orchard not one is dead from natural causes, which might be considered the more singular, as Mr. Smith pointed out, as the slope is a southern exposure which some regard as the one position to be avoided in cold countries. Another noteworthy fact is that it stands on ground of the shallowest description.

Two years ago several of the old trees were cut down and dug up when it was found that the soil in many places was only fourteen inches deep, the rocky ledge coming almost to the surface. From this course, however, the trees secured the warmth so necessary in our climate, the roots were thus prevented extending downwards as their nature is to do, and thus long life, vigor and productiveness was assured and maintained.

This goes to show each country must by its own experience discover the modes of culture best adapted to it, no matter whether they conflict with theories and experience acceptable elsewhere.

Mr. Smith has had a prominent part in public affairs, having served for the county in the local assembly, as postmaster at Woodstock and was an unsuccessful candidate of his party for the local house at the last election. His farm was the one selected by the Federal authorities as the Experimental Farm had that farm been located in this section of the Province as many hoped it would.

The Fisher Orchard, Woodstock, N. B., Second Oldest Commercial Orchard in the Province.

Young Wealthy Orchard Showing Summer Cultivation and Mulch in Geo. DeWitt's Orchard, Upper Woodstock, N. B,

C. L. S. AND A. J. RAYMOND

The Raymond brothers whose well kept dairy and fruit farm lies on the River Road two miles below Woodstock, have been distinctly and prominently identified with horticultural work for many years. Sons of the late Col. Raymond and brothers of Rev. W. O. Raymond, the New Brunswick historian, they reside on the old Raymond farm where Mr. C. L. S. Raymond has more especially carried on the horticultural work. His three acre orchard of New Brunswickers, close planted (16x16 ft.) has been a large and profitable producer, from 300 to 600 barrels annually, while an extensive market garden of vegetables and small fruits as strawberries, currents and gooseberries furnished a large share of what is used in Woodstock.

The ideas of these gentlemen have recently been expressed by Mr. Lee Raymond' "We have realized the necessity of care and thoroughness in all departments of the work. Fruit growing is one of the most interesting branches of farm work in spite of the uncertainties connected with doing a certain amount of experimental work. In regard to our experiences with varieties, we have not had success with the Japanese plums and some of the best blackberries, or pears, or cherries. Strawberries do well. Raspberries such as Cuthbert, Golden Queen, and even the Marlboro will stand our average winter if the canes are bent to the ground. Gooseberries are a fairly sure crop, all things considered we find the Downing about the most satisfactory.

Fifteen years ago we had an orchard of five or six hundred trees the greater part Mooer's Arctic, a considerable number of Imperial Gage and a few Lombards, Coe's Golden Drop Saunders and other varieties. We followed the method of cultivation devised and recommended by our great pioneer fruit grower the late F. P. Sharp, setting the trees in a deep furrow the main roots running in two directions and every fall bending them down to the ground by shovelling away a little earth at one side and staking them down so as to be covered and protected by the snow. When the frost was sufficiently gone out of the ground in spring the trees were raised and held upright by a stake. This process is undoubtedly very conducive to fruit formation, the tree appears to know by instinct that its hold upon the soil is insecure and expends its strength in production of fruit. Under this method the bearing life of the tree is relatively short but for a number of years we had large crops of plums.

Mr. S. L. Peters visited this orchard one season and declared it was the finest plum orchard he had yet seen. The Saunders, a yellow plum, seemed one of the most hardy, very early and a fine preserving fruit, so thinking it would stand without the work of laying down we got a dozen to try. These trees are nearly all alive today, stand the winters well, but for a number of years have borne no fruit although they have blossomed out. They are now too large to lay down and we would like to know what will make then bear.

The method of plum culture referred to by Mr. Raymond was discovered by Mr. Sharp more than thirty years ago, fully described by him in 1882 with the scientific reasons for extraordinary fruitfulness induced, and was justly regarded by him as one of the most important discoveries in horticulture. His own orchard of about five acres produced annually 3000 to 6000 peck boxes of plums and wherever this method has been followed in the Province plums have borne crops surpassing belief, the limbs requiring to be staked up to prevent breaking down under the weight of fruit. So much of the tree's vitality going into fruit year after year instead of trunk shortened the life of the tree limiting its most productive period to eleven or twelve years yet a sufficient period for enormous profit. The remedy is, of course that advocated and practiced by such eminent fruit growers as Mr. W. H. Bunting, of Ontario, with peaches, to maintain them so many years, each year adding a little new orchard and cutting down the old trees and making other use of the land.

HUMBOLT SHARP

The youngest son of F. P. Sharp, the subject of this sketch was for

TAPPAN ADNEY, Woodstock, N. B.
A well informed orchardist and son-in-law of the late F. P. Sharp.

many years a prominent figure and authority in horticultural matters here when his father gave up active work and made over the nursery business to his eldest son Franklin. The younger son received for his part the old orchard at Northampton including "Model Orchard" and engaged in the wholesale apple business, in 1890 shipping 30 carloads to market.

The "Model Orchard," 4 acres of New Brunswickers, close planted and now thinned to 16 feet each way, was then in its prime produced 400 to 1000 barrels annually. After his brother's decease in 1892 he took into partnership, C. W. Dugan, and for many years this firm handled the bulk of apples shipped from the county, and also engaged in the nursery business. With the decline in production, the export surplus of fruit gradually fell off and he was persuaded to try his fortunes in the West several years ago and removed to Red Deer, Alberta. Although expert in his line the climate did not prove suitable for nurseries but he was phenomenally successful in gardening as his father had been. So receiving an advantageous offer from

Humbolt Sharp, Upper Woodstock, N. B.

the fruit section of British Columbia where his special talent would have better outlet he removed thither with family and is now engaged in apple ranching at Armstrong, in that Province.

It is understood that he is experimenting and carrying out some of his father's discoveries regarding nursery tree cultivation. He left here when interest in fruit growing was at a rather low ebb, and the county has felt a distinct loss, as he left no one here quite so well versed in those methods of cultivation, pruning, etc., by following which in the past the county had attained a respectable position as a producer of fine fruit.

COLES W. DUGAN

Mr. Dugan is a native of Woodstock who had "gone West," when opportunity opened to go into partnership with Humboldt Sharp, in the apple shipping and nursery business. The firm handled about all the County apples from 1895 for a number of years.

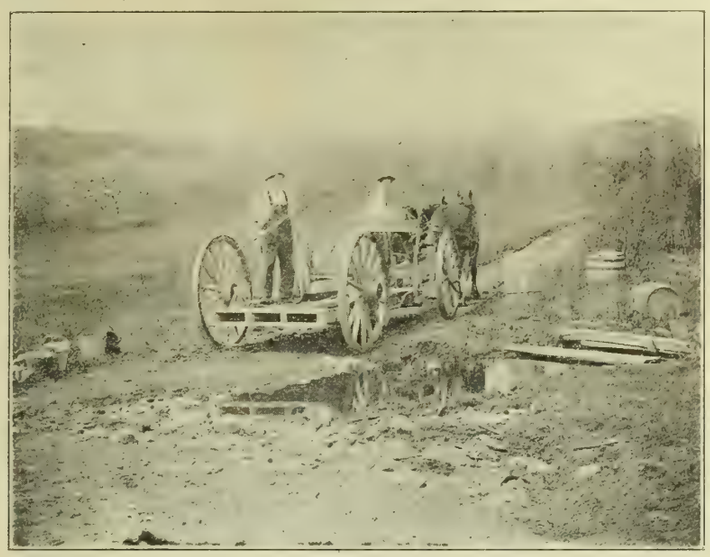
After the partnership dissolved Mr. Dugan went into the business of a wholesale dealer in farm psoduce and has been one of our largest shippers of hay, potatoes and apples. He purchased the Humboldt Sharp place at Northampton and owns the chief interest in ten acres, all Crimson Beauty apple trees in the Franklin Sharp Orchard, so that next to the Sharps he has had more to do with the handling of apples than any other man in the county and he has made it pay. It almost goes without saying that he is an advocate for the "local nursery," at any rate for this county, summing up his experience in these words:

"For sixteen years I handled practically all the fruit in the County and I have yet to buy, to my knowledge, a barrel of apples that came off an imported tree." Mr. Dugan is also actively interested in driving horses, his "Joe Hal" being perhaps his best known trackhorse.

LT. COL. H. F. W. DIBBLEE

Col. Dibblee is a citizen of Woodstock who has during many active years distinguished himself in connection with public and especially town matters who at the same time is one of our active farmers and interested in all matters relating to horticulture. One has only to get him started on the subject to be left in no doubt as to adaptability of New Brunswick to growing fine apples.

A son of the late Sheriff Dibblee and a connection of "Parson Dibblee" the first rector of Woodstock



Spraying in the Orchard of the Late F. P. Sharp, Woodstock, N. B.

A Young New Brunswicker

The Raymond Dairy and Fruit Farm, Woodstock, N. B.

who left in his diary interesting items about the country and the trials of the people in raising apples from seeds, as then was the only profitable practice, he is naturally appreciative of the impress left upon Horticulture by the late F. P. Sharp who showed us the way to profitable raising of fine varieties. He has a large young orchard of his own on his farm across the river.

Besides horticulture he is enthusiastic on the subject of the old "Warrior" strain of horses, which has descended in his family. He was for a number of years chief of the fire department and an officer in the artillary, now retired, and took a prominent part in canoeing when regattas and races were an annual feature of town life, and an enthusiastic sportsmen, in fact, an enthusiast in all his varied interests.

With A. B. Connell, Esq., he is trustee of the estate of the late F. P. Fisher, Esq., and is interested now in the planning and erection of various public buildings left by Mr. Fisher to the town of Woodstock.

WATSON BROTHERS

Three brothers displaying a faculty for working together are not so commonly met with but that the fact is worthy of mention. Such brothers are James, George and Mathias Watson. Their farms at the south of the village of "Hardscrabble" adjoin closely or rather comprise a single farm where in addition to general farming they have carried on for half a century the business of apple raising and market gardening.

The eldest (given in order above) came from the Old Country when a boy in 1848, with his father, Samuel Watson; his brothers were born here. It was at the time when upper Woodstock and adjoining district had begun to be the scenes of extensive activity in orchard and nursery work under direction of Mr. Sharp, so it was but natural that they should have begun work as boys with Mr. Sharp, continuing as long as the "Woodstock Nurseries" were in existence. They took exceptional interest in the subject and in their own work have been correspondingly successful. The brothers also, for a long time, specialized in cauliflower and cabbage, shipping a considerable amount to the St. John market. Their three acres of apple orchard of which one-half is Fameuse has been a source of profit, for they had learned the value of utmost care in packing so that our early apples packed by them for shipment are sufficient guarantee for better prices, while by exercising similar scrupulousness in packing the Fameuse and holding in storage they have commanded the top price in the local market.

Their Fameuse orchard stands on one of those bits of natural "Fameuse soil" where such a thing as scab has been unknown. Their crops have invariably been large, the fruit large and handsome, with the minimum cost for cultivation, a factor important to consider. Yet, speaking one day to them about this matter of net profit when considering what varieties would be most profitable commercially, the idea was advanced that if such a variety as New Brunswicker were sorted and packed as it should be and as it had been when Mr. Sharp set the standard there was more money in them at even a dollar a barrel at the orchard than in Fameuse stored and sold in Spring for five dollars, because of the greater quantity of crop, less care of special and costly nature when planted in the avrage soil of our country. This was said mainly in protest against the indifferent and almost invariably bad packing by our average farmers of the excellent, hardy and prolific varieties of which most of our orchards are comprised.

Good Fruit, Dairy Shorthorns and Poultry

A Good Combination

On F. Schafheitlin's Lyndhurst Farm, Canning, N. S.

LYNDHURST Farm, the steading of J. Schafheitlin, Canning, N. S. has an orchard of thirty-six acres which is considered to be the most valuable uart of the farm, and consequently is receiving special attention.

Lyndhurst was purchased by its present owner in September, 1910 and is run co-operatively by Mr. and Mrs. Schafheitlin, and their two daughters and two sons. The sons are preparing for their future vocation by studying at the N. S. A. C., Truro, and McDonald A. C., St. Anne De-Bellevue.

Prior to purchase by Mr. Schafheitlin, Lyndhurst with its thirty-six acres of orchard, dykelands and twenty acres of upland and pasture had been neglected for some years. Mr. Schafheitlin's predecessor did not keep any cattle on the place, only horses, whereas, now the farm supports twelve head of cattle including five milch cows, four horses, two colts, pigs, poultry and bees.

The daughters take particular interest in their flock of Rhode Island Reds and in cream-cheese and butter-making.

The Lyndhurst orchards have been much improved much to the satisfaction of the Schafheitlins since they took possession of it. Proper pruning, spraying and thinning and careful cultivation and extensive grafting has worked quite a change.

In 1911 the crop of apples was twice as large as it had ever been before. In 1912 the yield amounted to only 60 per cent. of that of the preceding year but the apples were of good size and clean quality, a fact much appreciated by the United Fruit Companees, of which Mr. Schafheitlin is an ardent member.

Mr. Schafheitlin's orchard practices are somewhat as follows:—

In fall, after the leaves have dropped, the orchard which had been seeded in June and July to buckwheat, vetch and which naturally grows much cadlock is plowed. In the spring as early as weather conditions permit he starts pruning the trees, a practice which he plans to follow every second year with a dormant spray of Lime-Sulphur and Arsenate of Lead—1 part Lime-Sulphur to ten parts of water and 2-3 lbs. of Arsenate of Lead to forty gallons of the above solution. During the months of May, June and July he gives his trees three more applications of Lime-Sulphur at the rate of 1-40 and Arsenate of Lead two to four pounds per forty gallons.

Residence of F. Schafheitlin, Lyndhurst Orchards, Canning, N. S.

Clean Cultivation in the Lyndhurst Orchards.

Poultry have a free run on Lyndhurst Orchards. One of the Colony Houses is seen in the center.

Blossom Time in the Lyndhurst Orchards

He is very careful to see that, whenever he sprays, that each tree gets a thorough soaking of the dilution and that no part of the trees remain dry. After the spraying has been finished, he thins the apples, beginning with the early varieties and finishing up with the later ones. He continues at this job whenever he has time to spare until the fruit has to be harvested.

During the months of May and June the orchard is cultivated. He uses about 600 pounds of complete fertilizer to the acre, or ten tons of barn yard manure. In a few acres of young orchard he raises potatoes and turnips. He does not get the results in root crops that he would like on account of the farm being over-run with cadlock, which is a great nuisance.

The Lyndhurst apple crop in 1911 amounted to 2200 barrels and in 1912 to 1300 barrels. This great falling off was partly caused by extensive grafting in the spring of 1912.

When Mr. Schafheitlin took the farm over there were 29 varieties of apples in the orchard but he intends to reduce the number of varieties to ten or twelve of the best commercial varieties.

The manager of the Canard Fruit Co., Ltd., of which Mr. Schafheitlin is a member says that the Lyndhurst apples were the best grown in 1912 by any member of the company as far as quality was concerned. They packed as follows:

Early apples. No. 1, 57½ per cent.; No. 2, 25½ per cent.; No. 3, 17 per cent.

Winter apples. No. 1, 61 per cent.; No. 2, 22 per cent; No. 3, 17 per cent.

The hay land is improved every five years by seeding down to oats and clover using 500 to 600 pounds Basic Slag to the acre as fertilizer.

Grade dairy Shorthorn cows are kept. He is keeping a daily record of the milk produced by each cow and in this way he tries to improve his herd. The heifer calves are raised and the bull calves are sold soon after birth.

Two of the horses on Lyndhurst Farm are brood mares which have been served by the best stallions available of their respective breeds. He plans to keep young and vigorous working horses by retaining the colts and selling off the old horses. The pigs are fatted from birth to the time they are five months old, when they usually attain a weight of 100 to 150 pounds Then they are butchered and the pork is sold at 9 to 12 cents per pound. About ten pigs are handled in this way each year and they materially help to turn waste product into cash.

A flock of 25 hens and 25 pullets of Single Comb Rhode Island Reds are also kept and each year when they are two to three years old the hens are killed off. The eggs for hatching are those produced by the best layers only and as a consequence a good laying strain has been established so that plenty of eggs are laid the whole year round. By careful selection of hatching eggs he hopes to improve the flock a great deal.

The hens are kept in colony houses, Macdonald type, and let out every day, whether cold or warm. In summer they are allowed the free run of the orchard.

The poulty rations consist of:—whole grain, oats, corn and buckwheat in the litter, mornings and at noon with milk and buttermilk evenings and roots or kitchen scrap and water once a day. Bran, oyster shell, grit are always on hand in feed chopper.

Italian bees are kept in Langstroth hives, which are protected in winter by packing cases. If necessary the bees are fed in spring and in one season they have made as much as 65 pounds of comb honey to the hive. One of the daughters takes special interest in bee raising and believes that the success in gardening and orcharding is partly due to the good work of the bees.

The Schafheitlins also grow a few acres each of potatoes, mangels and turnips, besides about 75 tons of hay and 350 bushels of oats and other grains all of which are fed on the farm and the fertility returned to the soil.

Mr. Schafheitlin says that his farming experiences have not been of long enough duration to say a great deal about financial success but is looking forward with bright hopes to the time when his sons, having completed their studies will return to the farm and together make it the success which the cause deserves.

The Schafheitlins all like farm life. They love their work and life in Nova Scotia and are ever ready to enjoy the many advantages that nature has bestowed on the Province of their adoption.

Bettering Own and Home District Conditions

Example Set by Joseph A. Kinsman Lakeville, N. S.

THIRTY-FIVE years ago Mr. Joseph A. Kinsman, of Lakeville, N. S., acquired the farm, on which he now conducts his farming operations, from his father.

The first year after it came into his possession he harvested only 65 barrels of apples from his four acre orchard. He set out young orchards every year until now it covers an area of over sixty acres, about thirty acres of which are in bearing.

Following are some of the yields in recent years:—

Year	Barrels packed fruit
1908	800
1910	1600
1911	3200
1912	1970

Within a few years he will possibly be growing 10,000 barrels of apples per year.

When Mr. Kinsman took over the property it maintained two horses, fifteen horned cattle and ten sheep. This year Mr. Kinsman is wintering ten horses, thirty-five horned cattle and fifty-six sheep. The sheep are well bred Oxford Downs; the cattle are pure bred Shorthorns. They are all of good quality and Mr. Kinsman sells a number for breeding purposes each year.

Gravenstein Row, in the Orchards of J. A, Kinsman, Lakeville, N. S.

Apple Picking Time in the Lyndhurst Orchards

The farm consists of 200 acres in the Valley and 300 acres of woodlands and pastures on the North mountain. The farm cuts about 100 tons hay, and also grows each year about 400 barrels potatoes, 2,000 bushels turnips, mangles, etc., and 800 bushels grain, oats, barley, etc.

The farm buildings are commodious and neatly kept. The residence, recently remodelled has telephone connection, bathroom, hot and cold water and other conveniences that make it an ideal farm home. A daily mail service delivers the Halifax morning papers at the door before dinner.

Mr. Kinsman has erected a large new barn 90x45, which, besides providing storage for manure, etc., has a fruit room in its basement that will store 1850 barrels. An apple warehouse on the premises provides ample room for 1000 barrels. The barn which was on the farm when Mr. Kinsman took possession has been kept in good repair and its dimensions are 44x42.

Mr. Kinsman has been an active worker for the best interests of his districts and he has been largely instrumental in getting many of the rural conveniences, daily mail, telephone extension, etc., for his district. He has been one of the chief agitators for a railroad through Lakeville district and the road now in course of construction will be a boon to the district. He has represented Ward 4 in the municipal council for 12 years and is an ex-President of the Kings County Board of Trade.

As an example of what Mr. Kinsman orchard is producing we refer to the following facts:—58 Starks set out 9 years ago picked 48 barrels; 25 Kings set out 10 years gave a yield of 17 barrels in 1912.

Mr. Kinsman has two sons associated with him on the farm. The other two sons are still in school and college. For a number of years Mr. Kinsman was one of the efficient fruit inspectors at the port of Halifax.

As an example of one who has striven and succeeded in bettering his own condition as well as the condition of his home district Mr. Joseph A. Kinsman has set a pace worthy of emulation.

FERTILIZERS for the PLUM ORCHARD

By Frank T. Shutt, M.A., Asst. Director and Dominion Chemist

IN COMMON with other orchard crops, the requirements of the plum tree, as regards plant food, are chiefly nitrogen, phosphoric acid and potash, and these essential elements of plant food must be present not only in fair quantities but in more or less readily available forms if vigorous growth and abundance of fruit are to be expected. In addition, lime is frequently of value, since all stone fruits make a considerable demand upon the available lime of the soil, and this, owing to natural causes or exhaustive cropping, may be reduced to mere traces.

Further, all rational systems of fertilization must include the renewal from time time of the vegetable organic matter of the soil, and this may be best attained when the supply of barnyard manure is insufficient, by the growth and turning under of green crops.

Nitrogen and Organic Matter:- Since these, from an agricultural point of view, intimately associated the one with the other, the latter being the natural conservation of the former, and economy, as a rule, dictating their use in orchards in such an associated form, we may conveniently consider their application under the same heading.

Barnyard manure undoubtedly stands first on the majority of farms for enriching the soil in these constituents and improving its physical condition. In composition and hence in value it is extremely variable, but good average samples of fresh manure may be considered to contain Nitrogen 0.5 per cent., phorphoric acid 0.25 per cent.; potash 0.45 per cent. The organic matter in fresh manure is usually in the neighborhood of 25 per cent.

Packing the 1912 Apple Crop---Three Generations of Fruit Growers on the Job
Photo by Frank A. Bolser, Spa Springs, N. S.

With many orchardists, however, the available supply of manure is insufficient and inadequate for the area to be fertilized and it is for such especially that the system of green manuring, as by the growth and turning under of a cover crop is especially valuable. The important role of the cover crop in the modern system of orchard soil is set forth in another place in this Bulletin and the whole subject of increasing fertility by means of clover has been very fully explained in Bulletin No. 40 of the Experimental Farms Series. It will, therefore, only be necessary here to state one or two of the principal reasons why clover or some other of the legumes should be employed for this purpose of enriching and improving the soil.

A vigorous crop of clover will contain at a moderate estimate, in its foliage and roots:-

Nitrogen from 100 to 150 lbs. per acre
Phosphoric acid 30 to 45 lbs. per acre
Potash 85 to 115 lbs. per acre.

It is evident, therefore, that by this use of clover we can with a single crop furnish the soil with as much nitro gen as would be supplied by a dressing of 10 tons of manure per acre. The great part of the nitrogen is taken by the clover from the atmosphere, and hence is a distinct addition to the soil. The phosphoric acid, potash and lime, it is true, have been obtained from the soil, but have largely been drawn from a considerable depth and hence increase the stores of these elements in the upper layers of the soil. Moreover, the decay of the clover sets free all these elements of plant food in forms readily utilizable by trees.

One or two words should also be added regarding the value of the organic matter so supplied. This eventually is converted into humus, the importance of which as a soil constituent it is difficult to overestimate. It only liberates slowly and continuously its plant food, but vastly improves the soil texture, whether it be a clay or a sandy loam. It increases the soil's power for absorbing and retaining moisture and it furnishes the best material for the development of microbic life which, as now known, plays so important a part in increasing a soil's fertility.

There is, of course, a possibility of too great an enrichment with nitrogen by this means; this would be indicated by a luxurious growth, dark green foliage and poor fruiting. Under such circumstances, the use of organic and nitrogenious fertilizers should be discontinued for a time. Instances of this kind however are rare.

To furnish immediately available nitrogen to young trees showing a

Fruit Growing, Winter Dairying and Poultry Raising

On Robert Newcomb's Maple Avenue Farm, Port Williams N. S.

ABOUT two miles from the Port Williams D. A. R. station on the northern bank of the Cornwallis River is located Maple Avenue Farm, the steading of Mr. Robert Newcombe, one of the most progressive young farmers of Kings County. A Farmer representative had the pleasure of paying a hurried visit to Maple Avenue Farm a few days ago.

Mr. Newcombe is one of the progressive young farmers of Nova Scotai who considered it would be time well spent to take a course at the Nova Scotia Agricultural College, at Truro. After completing a two years course at that institution he returned home and settled on the old homestead.

Mr. Newcombe is a firm believer in the theory which has so often been proved that taking one year with another it is not advisable nor always profitable for a farmer to put all his eggs, so to speak, in one basket. He believes that Valley farmers who are so situated as to be in a position to carry on a few side lines are not living up to their opportunities if they do not devote some of their energies along lines that will bring in a little extra money in their respective seasons and help to tide over during adverse fruit growing seasons.

While he considers that the Annapolis Valley is admirably adapted for specializing in fruit growing he

ROBERT NEWCOMB, Port Williams, N. S.
Proprietor of Maple Avenue Farm

also contends and has proved his contention that one or more side lines may be profitably carried on at the same time.

Mr. Newcombe looks upon farming as a regular manufacturing industry and, as in the latter, a good share of the profits are now-a-days made from by-products that were formerly considered as waste matter. So it is with the fruit grower. There are many odds and ends of crops and time that can be utilizeb to swell the profits if he is carrying on mixrd farming with his fruit growing.

The side lines carried on on Maple Avenue Farm are dairying and poultry raising. These lines were selected as best adapted to the owner's conditions.

As he is a member of the United Fruit Companies he is not obliged to pack apples during the winter so to solve the problem of giving employment to his men all the year he practices winter dairying. His cows are mostly grades but he is making a start with pure-bred Holsteins. He has a few pure-bred heifers and a pure-bred bull.

Maple Avenue Farm, The Steading of Robert Newcomb, Port William, N. S.

King Trees on Robt. Newcomb's Maple Avenue Farm, Port Williams, N. S.

Apple Picking Time in Robert Newcomb's Maple Avenue Orchard, Port Williams, N. S.

As he only raises the heifer calves from his herd he usually has a surplus quantity of skim milk to spare and in order turn it into cash, on the farm he raises a lot of pigs. He raises from fifty to eighty every spring and about half that number in the fall.

In the Maple Avenue Farm hog pens we saw tne pure bred Yorkshire sow, Cindrella Jane, with her twenty-one fine young porkers survivors out of a litter of twenty-two. Who can beat this record?

In the poultry raising side line Mr. Newcombe keeps one hundred pure-bred Rhode Island Red pullets. Between the first of January and the first of April the pullets have averaged over a fifty per cent. egg yield. The chickens are hatched in an incubator as he finds that that is the ideal way to get good early layers in desired numbers. He intends to go into poultry raising on a much larger scale as he considers it the most profitable business on his farm considering capital invested and time required. The hens have free range and during the summer season they are even busy, as hens ought to be gleaning the greater portion of their food from the range and manufacturing eggs at a lively rate.

Apple growing, however, is the main specialty on Maple Avenue Farm. Photos of the Maple Avenue orchard are shown in this number. That portion of the orchard devoted to the growing of Kings was originally a piece of worthless sandy land, not worth five dollars per acre for the growing of farm crops but now paying ten per cent. over and above expenses on a value of $1000.00 per acre.

Mr. Newcombe is a thorough believer in up-to-date orchard practices. Having successfully used Lime Sulphur and Arsenate of Lead for several seasons he claims that he would not go back to using Bordeaux on any account as he considers the former superior in its effects, both on fruit and foliage.

The Maple Avenue orchards are thoroughly cultivated until the middle or last of June when tares are sown for a cover crop in all parts except a small area near the hen house where he sows buckwheat for a fall run for the chickens. Mr. Newcombe is also starting in strawberry growing. Last year he set out one acre and this year he intends to set out an additional two acres.

Mr. Newcombe is making good. He gives the N. S. A. C. due credit for the general interest and inspiration it has given him in farm practice.

The general neatness that prevails around the farm may be seen by a glance at the accompanying cuts.

Buy a Spray Pump.

Even if you have no more than a dozen trees it will pay you to buy a spray pump. The barrel spray pump is what the average small fruit grower needs. It will be cheaper to buy the pump and then mount it on a good molasses or vinegar barrel, than to buy one already mounted. Any handy man with tools can easily mount the pump on the barrel himself. It is poor economy to select a cheap pump.

The Rotation System of Orchard Management

As Practised by Ernest H. Johnson, Greenwich, N. S.

WHILE on a hurried trip through the Annapolis Valley a week or two ago we had occasion to drive from Wolfville to Port Williams. While approaching Glenwood orchards, the steading of Mr. E. H. Johnson, we noticed a different system of cultivation from that in vogue in the orchards of the majority of Valley fruit growers. Our curiosity lead us to interview Mr. Johnson re his methods of orchard management and found that for seven years he has practiced what he calls a "rotation system."

For orchards in full bearing he plows either late in the fall or as early as possible in the spring, every other dale in the orchard and cultivates that thoroughly once a week up to the first week in July, when he seeds down with ten pounds Mammoth clover per acre.

Mr. Johnson works on the assumption that the unplowed dales act as a kind of safety valve for the trees. If he has a heavy set of fruit and the season is dry he cuts the clover the last week in June and lets it rot on the ground but if the set is rather light and the season somewhat moist he leaves the cutting until the first part of July, still allowing the clover to rot on the ground. On the other hand, if the fruit should be a very light crop, and the trees on the moist land so that there would be a danger of their making such a rank growth of wood as to lessen the prospect of a crop for next season he would even advise taking off the clover for hay in order to check the growth of wood and thus throw more strength into the fruit buds that are forming for next year.

The next season he lets the newly seeded dale stand and plows the other dale, which has stood in sod one season.

If orchard soil should become lumpy either from lack of humus or from hauling off apples when land is wet, he finds that it is a paying proposition to give the newly seeded dales a light dressing with stable manure, either late in the fall or early in the spring, for a few years until the land begins to work up nice and light.

Mr. Johnson likes to have his bearing trees making about six inches of new growth of wood each year and in order to get this he either uses a good dressing of stable manure or from 100 to 200 pounds of Nitrate of Soda per acre.

On light soils he uses from five to six hundred pounds of Acid Phosphate and one to two hundred pounds of Muriate of Potash per acre, while on heavy soils he uses five hundred pounds best grade Basic Slag and four hundred pounds Muriate of Potash.

Mr. Johnson says that six or seven years ago when so much discussion was going on through the horticultural department of the farm papers, as to which was the better treatment for orchards—sod or cultivation—he combined the two systems with the best results, namely:—improved quality and increased quantity of fruits.

By this system, men who are not fond of stock or think there is not enough money in it to pay may still have large orchards and produce as large crops and likely better quality than the men who depend entirely on stable manure for their orchard fertilization.

The way orchards are being planted in the Annapolis Valley the saving of one half the cultivation will be a big item in years to come. The saving of one-half the clover seed for cover crops at current prices is no small item in some of the larger orchards.

Residence of E. H. Johnson, Greenwich, N. S.

Nine Year Old Spy---One Barrel 1911, in J. S. Margeson's Birchlea Orchard, Berwick, N. S.

In picking time he finds the sod dales very convenient as places on which to put all the barrels. When the barrels are placed on the grassy ridges they are kept clean, it also makes the hauling easier and in wet seasons it saves tramping the newly seeded ground. In fact, the rotation system has everything excepting looks in its favor. While it certainly does not look so well as if the ground were well under cultivation, still there are very few growers in the Valley who are growing fruit for looks. Consequently this fault may not prevent many from adopting the profitable method of culture practiced in the Glenwood orchards.

Mr. Johnson thinks the most profitable stock to raise on a fruit farm is the heavy draft horse, for in order to make a success of the fruit business one must have plenty of teams to cultivate his orchards during the early part of the season. The reason why fruit growers do not keep sufficient teams to do their work thoroughly in summer is the cost of wintering so many idle horses. Mr. Johnston's suggestion to the fruit growers is that they make up at least a part of their teams of heavy draft mares and have them drop their foals about the first of September, just about the time the apple picking season comes on and the after-grass is ready for pasturing.

On small fruit farms where only one pair of horses is usually kept, a pair of heavy brood mares, with a little extra feed, will handle the apple crop and suckle their foals, with very little inconvenience and much profit to the owners.

On the larger fruit farms, where more than one pair is kept it is often possible to turn the brood mares out to grass during the apple picking season and after that they may be brought in to make up a second team for fall plowing.

For winter quarters a mare and foal should have a box stable about 11 ft.x12 ft.; but they do not need nearly so warm a stable as dairy cows.

At the time we called on Mr. Johnson he showed us two as fine Clyde foals as we ever saw raised in summer, and for which he had refused $125.00 each. These foals, he said, had been out in a well enclosed yard, from one to four hours, according to weather, every day during the winter, so they had not suffered for lack of exercise. The mares had never been out of their stalls all winter and were in good condition for brood mares, suckling a foal and in an advanced stage of pregnancy with their September 1913 foals.

Mr. Johnson says that he has never known a case of scratches or stocking of the mares while they are suckling their foals, but as soon as weaning the foals commences, the mares must be exercised every day. He requires three heavy teams to do the work in his orchards and of these five mares are due to foal next September.

It is Mr. Johnson's idea that the Experimental Fruit Station at Kentville would benefit the fruit growers very materially by conducting experiments in horse raising, as the horse business certainly fits into the fruit industry better than beef raising. In this connection we would say that we were informed by Prof. W. S. Blair, of the fruit station, that he proposes conducting experiments along the horse raising line. He was much impressed with the results achieved by Mr. Johnson, whose horse breeding operations he seemed to be following with a great deal of interest.

Mr. Johnson is one of the most progressive fruit growers of his district. His achievements are looked to with pride by a wide circle of his acquaintances and he leads the way by precept and example in what he believes to be the most profitable practices to follow in Glenwood orchards.

As an instance of his public spiritedness we noticed that when the roads through his district were almost rendered impassable at the time of our visit by the combined action of rain and frost upheavals the section of road opposite his farm was almost as dry as the town streets, rendered so by the use of the split log drag. If each and every farmer would take a leaf out of Mr. Johnson's book in this respect, the roads through the length and breadth of our land would be very materially improved.

ERNEST H. JOHNSON, Greenwich, N. S.

I have visited many hundreds of orchards, old and young, and do not recall ever having seen a dozen dead or dying trees that were in this condition as the result of old age. Accidents, neglect, mistakes in pruning and injuries of various sorts, in nearly all cases preventable, have been the cause.—A. McNeil, Chief, Fruit Division, Ottawa.

THE FARM KITCHEN GARDEN

A Valuable Home Asset

By James Allen, Truro, N. S

MANY people who have taken up farming as their life's occupation do not know the good taste of some of our most common vegetables. These products our city brethern get and often have to pay good prices for them. The people who are fortunate enough to possess a farm might well have all these delicacies for their own use with very little effort or trouble, provided only a piece of land near the house is devoted to the purposes of a kitchen garden. The returns from even a small piece of ground properly managed will add greatly to the health and pleasure of the family and reduce

James Allen, Superintendent of Grounds and Gardens, N. S. A. C., Truro, N. S.

the outgo for other food and supplies.

The vegetable garden of the farmer or his helpmate should be situated near the house so as to be more convenient for cultivation and more accessible for gathering the products. It should be on a piece of land that is fairly well drained, having a gentle slope to the south. If it is possible to be sheltered on the north, by a windbreak of evergreens, it will help to make it an early planting spot. Early in the fall of the year, good barnyard manure, not too strawy, should be applied to the land broadcast at the rate of 40-50 ton per acre and should be plowed under. It should then be well harrowed as many times as possible, till just before heavy frost sets in, when the whole should be thrown up roughly with the plow, so as the climatic conditions of the winter will pulverize the soil, destroy certain insects and make it into an ideal seed bed, by springtime. It should then be loosened up and made ready for seed sowing. Just before the last harrowing it is a wise plan to broadcast some complete fertilizer which is well supplied with quickly available plant food. The farmer may think that an extravagant use of fertilizers, but if one goes on to grow vegetables the first aim should be quality as well as quantity. In order to get quality they should be grown without check, for if they get a check they will be tough, woody and bitter.

In this country of ours we should select the best seed we can get. The short season or quick growing varieties should be given the preference as they will come to maturity earlier. While this is especially true of some of the tender plants as beans, corn and tomatoes.

Even with some of the hardier vegetables, the earlier varieties are preferable on account of their quick growth. For the winter supplies later sowing may be made of the early varieties, and they will be better in quality too.

When the land has been put into proper condition and is ready to receive the seed we should get it in as soon as possible, weather permitting.

In the laying out of the garden, which is a matter of individual choice, it is to the owner's interest to have the crops planted in long straight rows so as to greatly facilitate the work of caring for it by the frequent use of the horse cultivator. Substituting horse cultivation for hand labor will greatly lessen the work and relieve the drudgery of garden operations.

Taking carrots, parsnips, and salsify, (or vegetable oyster) these require ground that is prepared deeply as they send long roots down into the ground which should be free from stones. They do not like to have anything obstruct their downward growth. The parsnips and salsify should be sown as soon as the danger from heavy frosts is past, sowing about eighteen inches between rows and thinning out to 6 inches apart, as they require a long season of growth. Part of the crop should be lifted in the late fall, and stored in a cool cellar and should be covered with sand or earth to keep from shriveling up. The balance can be left in the ground till spring when they can be lifted for spring use, as parsnips and salsify are greatly improved with frost.

Sowings of the early varieties of beets, carrots and turnips may be made on through the season to the middle of June in rows 4 in. apart and thinned out to 4 in. apart in the rows. This will give a supply for midsummer and on through the winter. For winter starage they may be treated as recommended for parsnips and salsify. Turnips are sown in drills 30 in. apart and thinned out to 12 in. in the rows. Some of the selected Swedes are best grown for winter use and the crop sown the last of May.

Onions require a good rich piece of ground which has had a good dressing of fertilizer with quickly available plant food. The seed should be sown as early as possible so that the plant will make considerable growth while the weather is cool and get ahead of the early weeds. They should be sown in rows 14 in. apart and when ready for thinning should be thinned out to 3 in. or 4 in. apart in the rows. The soil should be made rather firm over the seed after sowing.

Early onions, which are greatly used for flavoring soups and stews are grown from sets which can be obtained from the seed dealers. They are planted in well prepared ground in rows 14 in. apart and thinned 4 in. apart in the rows. They grow very quickly and are pulled when green and used as young onions.

String beans are another good vegetable belonging to the family of legumes or nitrogen bearing plants. They require soil of fairly good tilth with a liberal quantity of available plant fond containing a goodly percentage of nitrogen, because they are plants which will be stunted if checked in their growth and the ripening of the fruit will be late and of an inferior quality. They should be planted in rows 24 in. apart, 2 in. deep and about 4 in. apart in the rows after settled warm weather has arrived and the ground has become fairly well warmed up.

Peas are another of our legumes of which there are dwarf, medium and tall varieties. I think the dwarf varieties, such as Nott's Excelsior, American Wonder, etc., which do not grow much over 15 in. would be the easiest to grow in the farm kitchen garden. They would not require to be staked and they can be planted much closer than the taller varieties, making the rows 3 in. deep by 6 in. wide and scattering the seed in the bottom thinly, then cover with about 1½ inches of soil and when up about 3 in. tall pull in the rest of the soil as you cultivate.

Squashes and pumpkins are grown in hills 8 feet apart. Either the whole ground should be manured or a liberal dressing given at the hill. About 8 seeds should be sown in each hill thinning out to three of the strongest plants when they have attained their second leaf, and keeping a close lookout for insects. The first should be harvested when ripe before heavy frosts set in and kept in a cool dry place free from frost.

Spinach is one of our earliest vegetables we get from the garden in spring or early summer. It is sown in rows 15 in. apart rather thinly and should be cut before it starts to run to seed. The New Zealand spinach is a perennial and the more you cut it the more it will grow, which makes it superior to the annual variety.

Swiss Chard is another plant that is easily grown. It is a beet grown for the leaves which are cooked like spinach and the heavy mid-ribs are cooked like asparagus. The last two named I would recommend strongly for the farm garden.

Lettuce is one of our salad crops and one which should be grown by every farmer. Its tractable nature and freedom from insects and diseases makes it about one of the easiest to be grown. Sow thinly in the open ground when in proper condition to work, in rows about 12 in. apart and about 10 in. in the rows.

Sweet corn is sown in hills three feet apart each way with about 8 seeds to a hill thinning out to 3 or 4 of the strongest, or in rows 3½ feet apart and grown about 8 in. apart in the rows. It requires ground well worked up with a liberal supply of plant food and thorough cultivation.

Celery, for early use, should be sown in a hot bed in March and for the main crop about April 1st, in a cold frame that has had some good friable soil put in for its second bed. After sowing, the soil should be made firm with a small piece of board. When the young plants are up and are large enough, they should be picked off into another bed. When it is time to plant out in the open ground which is any time after the middle of June till July, they should

(Continued on page 494)

Practices that Will Create a Market for N. B. Apples

By S. L. Peters, President N, B. Fruit Growers' Association.

OF THE pioneer fruit growers of New Brunswick probably there is not a better informed or more enthusiastic man in the business today than Mr. S. L. Peters, Queenstown, N. B.

When the department was in need of a fruit inspector for the province the choice fell on Mr. Peters as a man whose example would be consistent with the principles he would be called upon to teach.

Mr. Peters is not many stations removed from the three score and ten but his mind is as active and his energies are as unabated as those of men many years his junior. He is well educated, a forceful, pleasing speaker and one who has made good in orchard practice. He contributes the following advice for our New Brunswick fruit growing readers:

S. L. Peters, Queenstown, N. B.
Dominion Fruit Inspector for New Brunswick.

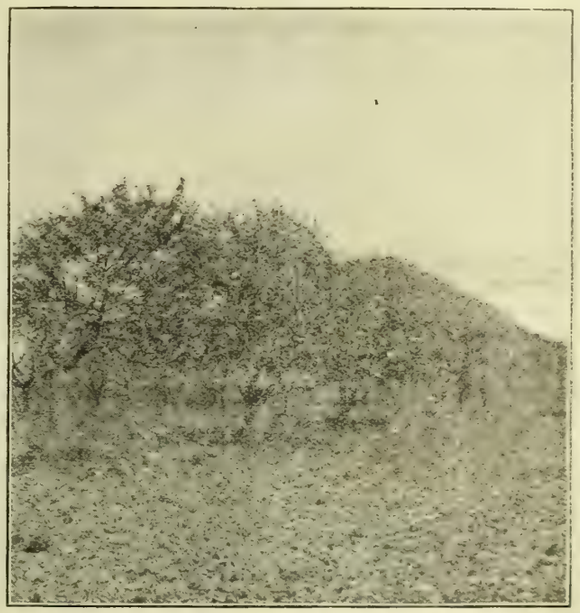
"I am pleased to note the prominence you have always given to the horticultural interests of the Maritime Provioces and learn with the greatest satisfaction that you propose giving particular prominence to this industry in your April issue.

With reference to the outlook for New Brunswick apples, I do not think it could appear brighter. The past year, 1912, every orchardist that gave to his business, proper care, from the opening of the spring time, until the fruit was picked, graded and packed has nothing to camplain of in marketing conditions. Prices were exceedingly good in our home markets for high grade fruit, and the profits lie, in growing nothing else, and then proper packing.

Having had the opportunity of visiting several sections of the Province during the months of February and March in connection with the short courses in fruit growing I was much surprised at the great number of apple trees, sturdy ones, strong and healthy that I judged was not doing much for their owners in the way of money making, simply because of neglect or want of care. Of course, this applies to those orchards planted by our fathers years ago, and when the settlements were being made. It seemed to me that there was a wealth of money in these old orchards if proper care and culture were given them. Why not? My friends, prune, cultivate, and fertilize those old orchards. Those trees that are not bearing good varieties, have them top grafted with varieties that are desirable for the market. In four years they will be giving you returns for your care and attention so abundant as to make you really feel the losses incurred in not having had it done earlier in life. It will be some years yet before we shall be able to supply our home markets with apples, of the best grade and variety, and when we have done this the markets of the world are open to us for the high grade quality and the special varieties that are sought after in these markets, and which can be so well and profitably grown in our own Province.

It should be our pride to grow, under our favorable conditions, nothing but the best fruit of its kind. See to it with the most scrupulous care that grading and packing is just a little better than is required under the "Fruit Marks Act." Let the New Brunswick standard for apple packing and grading be recognized as the best and we shall have no difficulty in marketing our products.

Everything looks promising for the present year. The winter has not been cold and the fruit buds look to have come through the season in good condition. The task is ours, to see that prouer pruning, timely spraying and thorough cultivation and manuring is given our orchards. The better work done, the better fruit we shall have and the larger our income from the orchards will be. The Fruit Growers' Association will hold their third annual fruit show in St. John in November of the present year. May we not hope to see every district in the Province represented at that exhibition with their best fruits, so that we shall be able to again vindicate the claim that New Brunswick has the best fruit lands available.



Clean Cultivation in Orchard of S. L. Peters, Queenstown.

Renovating a Neglected York County Orchard

Care for the Trees, the Trees will Care for You

ABOUT thirty years ago, Mr. Joseph Hawkins, Douglas, York County, N. B., purchased the farm on which he now resides. The farm had an orchard of old native apple trees, the greater number of which were afterwards cut down and replaced with new trees of the more modern varieties—Wealthys, Fameuse McIntosh Reds, Bethels and Alexanders. When the trees were young he tilled the land for a number of years. A few trees were set out each year until last year when he set out no fewer than three hundred trees of different varieties. Mr. Hawkins allowed his first orchard to grow up in grass and it remained so for about fifteen years or more and was occasionally fertilized with a top dressing of some kind. He found that by following this practice his trees were going back instead of forward in their yield. The fruit grew smaller, the trees became badly sun-scalded and badly covered with moss and other fungi. The McIntosh Red apples looked more like frost bitten butter nuts than apples and would be so badly spotted that they were unfit for use and he began to think seriously of top grafting the trees to some other variety.

Geo L. Thompson's Homestead, Berwick, N. S.

While working in his blacksmith shop one day in 1911—for he was a blacksmith by trade, farming and orcharding was only a side line— he was approached by Mr. A. G. Turney, the then newly appointed provincial horticulturist, who was looking for a small orchard, within a short distance of Fredericton, in which he could carry on demonstration work. Together they trudged through the orchard and finally it was agreed that the orchard would be worked under the direction of Mr. Turney.

Work was commenced about the first of April. The old trees were pruned and the brush was removed. The land was spread over with manure. The trees were scraped and fungus growths and peelings of bark were removed. The sun scalds were dressed and put in a condition for healthy growth by painting the wounds with white lead. The trees were then sprayed with lime water and the ground was ploughed as soon as conditions of soil and climate permitted. This was a difficult task. The hired man was requested to leave no sod unturned and he acted accordingly. The whole orchard was then top dressed with fertilizers in June and sown to a cover crop of clover and alfalfa, which took root and grew very nicely. The orchard was sprayed four times and it yielded a good crop of fruit. During the pruning season he heard some passers-by remark "I would not have my orchard cut in that way," while others said: "Mr. Hawkins's orchard is ruined.

Prior to 1911 he never got in one year more than $100.00 out of his orchard. In the year 1911 he got a return of over $300.00 dollars—a handsome profit being left after all incidental expenses were accounted for.

In the year 1912 his orchard was gone through and pruned and sprayed three times with no further expense

(Continued on page 491)

Teacher, Institute Speaker and Fruit Grower

The Three Combined in the Person of L. D. Robinson, Berwick, N. S.

MR. L. D. ROBINSON, the subject of this sketch spent the first twenty-one years of his life with his father on a mountain farm, in Nicholsville, now owned by his brother-in-law, Mr. S. G. Saunders.

His father, Benjamin E. Robinson, was a pioneer in apple growing and continued to plant apple trees until he reached a ripe old age. Many of the old time would-be wiseacres used to tell him "you will never eat apples off them" but invariably the pioneer's answer was "If I do not somebody else will."

Nurtured amid apple blossoms and acquiring a close imtimacy with orchard management as he grew to manhood it is small wonder that the son of such a father should have developed an intense love for fruit growing.

On reaching his majority, Mr. Robinson took a two-years' course at Mount Allison, N. B. and then entered the teaching profession, in which he gained a reputation second to none in the province.

About thirty years ago, having resigned the principalship of the Dartmouth schools, he came to Berwick with his bride and settled upon the farm which he still occupies. Here he at once began the renovation of an old orchard of some fifty trees and made preparation for orchard extension, but before the close of the year the line of the school room took possession of him and he became the principal of the Berwick schools. Under his fostering care and untiring efforts this school soon became famous throughout the Annapolis Valley.

During the fifteen years that Mr. Robinson was connected with the Berwick school the farm was gradually improving. But it was not until he was able to give it his undivided attention that it was seen at its best.

Mr. Robinson brought to his farm the happy combination of practical and scientific knowledge, which soon brought forth results in increased crop production along with increased soil fertility.

He has specialized on potato growing, apple growing and strawberry growing. In all these lines his success has been very instructive to others as well as gratifying to himself.

One year he made a record in potato growing that probably has not been surpassed in the Province of Nova Scotia—570 bushels from two acres.

Last year, although unfavorable for strawberry growing he grew 15,000 boxes of strawberries on two and one-half acres. He was also the winner of the Prof. Cumming Prize of $10.00 for the best barrel of Gravensteins, produced in Nova Scotia, as well as a number of other prizes awarded at the 1912 Nova Scotia Horticultural Exhibition held in Bridgetown.

He is a firm believer in thorough spraying. He feels sure that far better apples can be produced by the use of Lime-Sulphur spray than by the use of Bordeaux.

An interesting, instructive spraying article from his versatile pen appears elsewhere in this issue.

Not only has Mr. Robinson won for himself a high place among teachers and horticulturists but among institute speakers as well. Having owned and operated one of the first spray pumps in the Valley, like Noah of old, he became the object of ridicule to the unbelievers. To their taunts "spray the roots" he would reply, "you will have either to spray your trees or cut them down." Fools who came to his meetings to scoff were often led to see the errors of their way and frequently remained to s(pray). And his prophecy eventually became true, they did and do spray.

IN JUDSON S. MARGESON'S ORCHARD
Note the Low Heads and Thrifty Growth.

Another Example of Thrifty Growth—Judson S. Margeson's Orchard.

Crimson Beauty Trees in the F. P. Sharp Orchard, Woodstock, N. B.

One of the first public demonstrations in the Annapolis Valley showing how to make Bordeaux mixture was given by Mr. Robinson, in Welsford, Kings County.

Mr. Robinson's sons, three in number, are ardent horticulturists. J. Milton Robinson, the eldest son, is a B. S. A., of McDonald College, a specialist in fruit culture, who is now assistant director of the Experimental Station at Kentville. It was a source of great satisfaction to Mr. Robinson to be associated as institute speaker in Annapolis County recently with his worthy son.

Louis Robinson, the second son, has graduated in law and has taken up the practice of his profession in the West where he is ever ready to uphold the good qualities of Nova Scotia grown apples. He was the means last fall of turning the joke on a hot air artist from British Columbia who was trying to impress the good qualities of British Columbia apples on a prairie town dealer as Mr. Robinson chanced to enter the shop to make some purchases. Mr. Robinson had two well-grown, perfectly-colored specimens of Nova Scotia Gravensteins in his pocket, which he had just received from home and when the B. C. artist pulled out a couple of western grown Gravensteins, much inferior to the Nova Scotia Scotia grown apple, and had the audacity to say to the dealer "they cannot grow any Gravensteins like those in Nova Scotia." Mr. Robinson's eastern spirit arose and pulling out his pair of Gravensteins remarked "these are Nova Scotia grown apples." He had the B. C. product trimmed to a standstill. Needless to say the B. C. artist was nonpulsed and the dealer saw the point.

Harold, the youngest son, is associated with his father in his orcharding operations while the only daughter, Bessie, is an expert in assisting her mother with the household duties.

Mr. L. D. Robinson is one of the few who harvested a large percentage of clean fruit by thorough spraying in 1912. He talks spraying, he practices systematic spraying and the results he obtains speak volumes in its favor.

Seasonable Spraying Suggestions by L. D. Robinson.

THE experience of the past season has demonstrated to fruit growers, as never before, the absolute necessity of thorough spraying. Careless spraying cost this Annapolis Valley, last season more than $100,000.00, to say nothig of the loss our reputation as fruit growers has sustained. Pruning, cultivating, fertilizing and thinning count for little where spraying has ben neglected.

We are facing competition and must grow better fruit. The first step toward better fruit is better spraying.

WHAT SPRAY TO USE.

It is an old saying that "Revolutions never go backwards." The great revolutions in favor of Lime-Sulphur will not go backwards. It may roll on till Lime-Sulphur is displaced by a better spray but it will never go back to Bordeaux. Lime Sulphur has put Bordeaux down and out on two counts. It does more work than Bordeaux and it does it better. Not only is Lime-Sulphur an efficient fungicide, but it is also a powerful insecticide, our bulwark against Scale, Bark Louse, etc.

Bordeaux is a fungicide only. The use of Lime-Sulphur adds a gloss and color to both foliage and fruit that nature cannot rival. The use of Bordeaux in quantities sufficient to control scab in a season such as the past, is certain to result in serious damage to foliage and fruit.

DILUTIONS OF LIME-SULPHUR.

The margin between the effective strength and the danger point of a

Lime-Sulphur wash for use on foliage is somewhat narrow. The hydrometer is very important in making dilutions for use on foliage, especially in the case of home made concentrates. The proper strength for dormant spraying is 1.03; for use on foliage 1.009.

NUMBER GALLONS CONCENTRATE TO USE.

Multiply the number of gallons the tank holds by the decimal part of desired strength, and then divides this result by the decimal part of the strength of the concentrate used. The figure obtained shows the number gallons concentrate to use. Commercial Lime-Sulphur tests from 32 degrees to 33 degrees barometer or from 1.283 to 1.295 hydrometer scale. We will employ the former figure as it represents about the average strength of the commercial Lime-Sulphur.

$\frac{40 \times .03}{.283}$ equals 4 1-5 gals. equals No. gals. concentrate to use in 40 gals. dormant spray.

$\frac{40 \times .009}{.283}$ equals 5 quarts equals No. qts. concentrate to use in 40 gals. summer spray.

These figures show that one cause of failure to get good results last season was the insufficient quantity of concentrate used—5 quarts should have been used instead of 1 gallon to 40 gallons for use on foliage.

ARSENICALS.

Arsenate of lead is the only form of Arsenic that can safely be used with Lime-Sulphur. There are two forms of Lead Arsenate—the mentral form and the acid form. Some authorities advise the use of the former as less liable to develop free arsenic in the spray. However, nothing has yet been proved to show that there is a preference. Arsenate of Lead should always be used in Lime-Sulphur sprays at the rate of not less that 2½ pounds to 40 gallons, not only as an insecticide, but also on account of its fungicidal effects. Arsenate of Lead should first be reduced to a paste by adding water then gradually thinned till it can be poured freely into the cask or tank. On account of the chemical action taking place when Lime-Sulphur and Arsenate of Lead are brought together, the agitator should be kept vigorously in motion when the Arsenate of Lead is being added.

WHEN TO SPRAY.

A good practical knowledge of the life history of orchard pests will help to decide the question of "when to spray." The old adage "an ounce of prevention is worth a pound of cure" applies with great force here. The object of spraying is preventive, not curative. Youth is the weakest link in the chain of life. Biting insects should be destroyed when they first hatch; apple scab as soon as the spores fasten themselves on the leaves. Once let apple scab, bud moth and caterpillars establish themselves, then all the spraying in the world will avail nothing. Spray for bud moth, scab, and bark louse, just as the leaf buds are bursting; for apple scab, bud moth, and caterpillars, a little before the blossoms open; for apple scab, codling moth, and other caterpillars, when two-thirds of the blossoms have fallen; for apple scab, apple worm, and other caterpillars, ten days after blossoms have fallen; and if weather conditions are bad, for apple scab, fly speck spot, young bud moth and other caterpillars, when apples are as big as large crabs.

A Section of Judson S. Margeson's Birchlea Farm, Berwick, N. S., in 1911.

SPRAYING OUTFIT.

In the larger orchards the power sprayer is rapidly displacing the hand pump. In orchards producing from 600 to 1000 barrels of apples, a good power sprayer will undoubtedly pay; in larger orchards the power sprayer has become a necessity. It is practically impossible to grow clean fruit in a larger orchard, where the spraying must be done by hand.

The essentials of a good power sprayer are: First, efficiency; secondly, simplicity; third, economy. An efficient power sprayer should be able to maintain a pressure of 200 pounds on four disc nozzles. No power sprayer without a mechanical agitator is worthy of the name.

Dr. Stewart, of Pennsylvania, in a recent address at Middleton, said the Dade propellor type of agitator was the best. Without thorough agitation Arsenate of Lead loses much of its value both as a fungicide, and as an insecticide. Disc nozzles are much to be preferred to the other types, and should always be at an angle to the rod. Rods should be not less 12 feet long and lines of hose not less than 25 feet—some use 50 foot lines of hose. After the day's work is over water should be pumped through the machine till it comes out of the nozzle clear.

HOW TO SPRAY.

Of all mistakes made in spraying, perhaps, lack of thoroughness is the most fatal. In the case of Lime-Sulphur thorough spraying means

Experimental Station for the Annapolis Valley

A Long Felt Need Supplied

THE fruit growers of the Annapolis Valley have for years been agitating for definite experimental work with orchard fruits. To meet their wishes a farm was purchased by the Nova Scotia Government at Kentville, N. S., located about a mile from the station, in the year of 1910. This farm was handed over to the Dominion Government in 1911 and has since that time been conducted as a part of the experimental farm system.

Little work except the clearing of some land was done until the spring of 1912, when work of a definite character was commenced and a superintendent appointed. The choice of a superintendent has been entirely satisfactory to all concerned. Prof. W. S. Blair, who has given up his work as Professor of Horticulture, at Macdonald College, P. Q., where he had a large department under his direction, takes up the work with a good record.

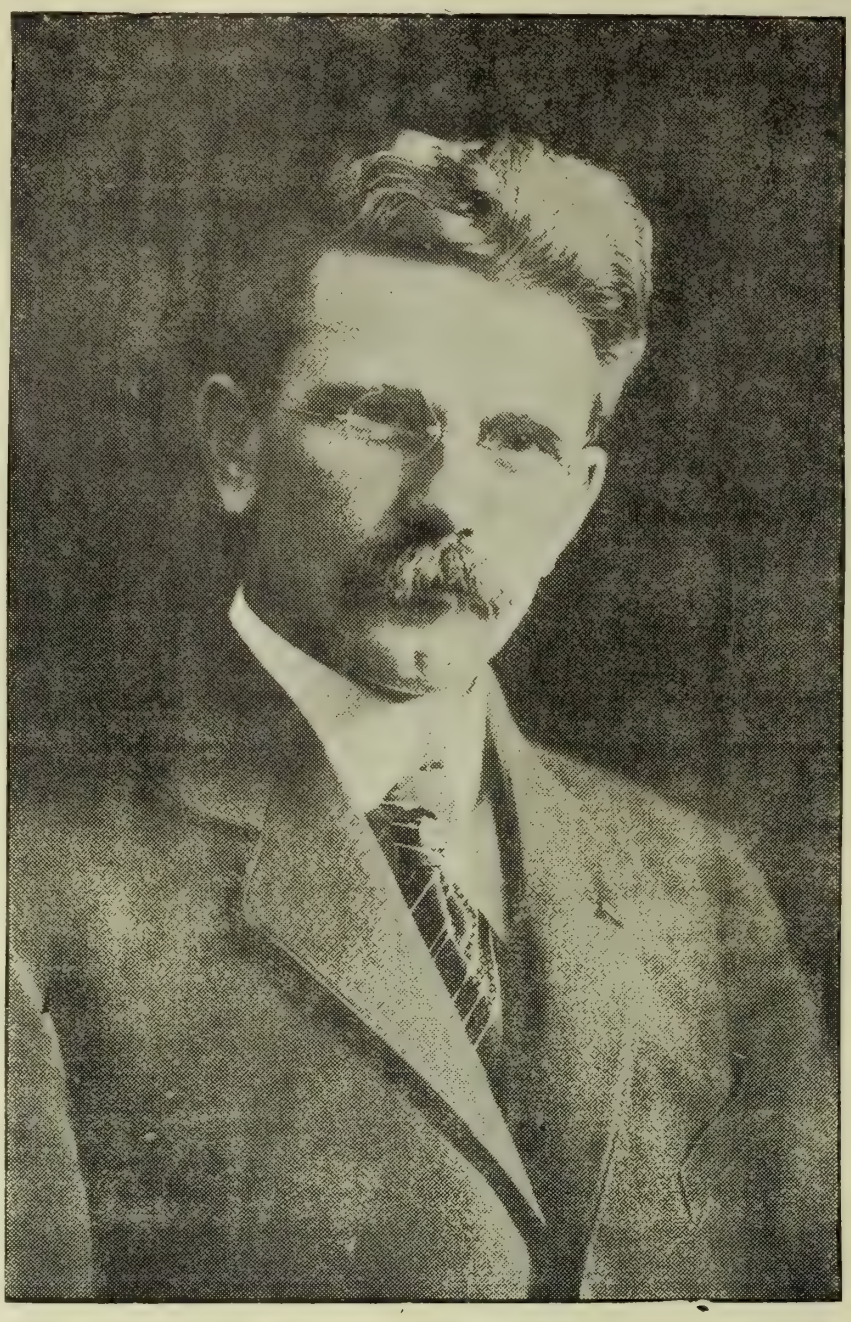
In looking for a man to take up the experimental work at Kentville, for the Annapolis Valley, where such large fruit interests were at stake, the endeavour was to secure the best horticulturist available, and it would seem, judging from the work already done and the plans for future work, that the choice was a good one. We had the pleasure of calling upon the superintendent a short time ago, and with him tramped over the various parts of the farm getting a general idea of the work contemplated.

The farm comprises an area of 294 acres of which only about 80 acres are cleared, including 10 acres of dyke land. The farm when purchased was practically all wooded. About 50 acres have been cleared, and 50 acres more are ready for stumping which it is proposed to do this year.

The clearing of this land with stumps still green is very costly and runs about $200.00 per acre. Stumping machines are used, the stumps are pulled out and burned after which a breaking plow with three pair of oxen is used in the final breaking. Many stumps have to be blown out with dynamite, adding materially to the cost. Following the plowing many roots must be gathered, piled and burned and the ground is then harrowed and seeded to buckwheat.

About 100 asres of the farm is taken up by a ravine which extends along one side of the back of the farm a distance of about one mile. Through this ravine a stream winds making with the heavily wooded banks one of the prettiest natural parks ever visited. At the upper end of the ravine two waterfalls, one having a drop of about 40 feet is especially attractive. The natural forests have been protected throughout the entire length of the ravine and the intention is to do no cutting in this area whatever, except to clear out dead leaves. The work of putting a good drive-way up to the waterfalls and developing the whole ravine into a park will necessarily be done by degrees and cover some years. Progress has been made and a good winter road makes it possible for visitors to enjoy the beauties of the whole ravine. This is certainly an attractive feature of the farm and a great asset to the town of Kentville.

During the summer nine buildings were erected on the station grounds. The superintendent's residence is plain but has good architectural features and is nicely situated. It is located on the western boundary. Towards the eastern boundary the bran, carriage, poultry and dairy buildings are located and at some little distance from this is a foreman's residence and a double house for the herdsman and head teamster.



Prof. W. S. Blair, Superintendent of the Station

The front part of the farm is sloping toward the north, and on this slope an orchard of 18 acres has already been planted. The upper fields are fairly level with a little heavier type of soil than that found on the lower lying areas.

J. Milton Robinson, B. S. A.
Assistant Superintendent of the Station.

While fruits will be given the first consideration, it is the intention to run about one-third of the farm in farm crops. The superintendent is of the opinion that fruit growing can be carried on more profitably on the majority of farms by carrying some stock as well. He thinks the growers must carry more permanent help in order to handle their orchard in the most economical way and dairying or some form of live stock husbandry which will give winter employment is a solution of the problem of efficient help.

The barn is well equipped for carrying about 30 head of stock. In addition to the three pair of working oxen and seven horses nineteen steers were fed during the winter.

A large silo has been erected and this year ten acres of corn will be grown in addition to five acres of turnips. Twenty acres of potatoes will be planted in the young orchard. Prof. Blair does not believe in fillers for the average farm as a business proposition, and thinks intermediate farm crops can be grown to much better advantage. He has no

Getting the land ready for the plow on the Kentville Experimental Station.

Breaking the newly cleared land for the Experimental Orchards, Kentville, N. S.

The Superintendent's Residence, Experimental Station, Kentville, N. S.

New Barns and Farm Help Cottages on the Experimental Station, Kentville, N. S.

objection to fillers one way through the orchard but thinks a space 33 to 40 feet apart should be left between the rows one way thus giving an opportunity to grow farm crops profitably between the trees while the trees are growing and enable the operator to properly handle the orchard after it does grow. He is also of the opinion that cultural experimental work is of the greatest importance and experiments with this in view will be undertaken with both orchard and field crops.

A comprehensive series of experiments with orchard fruits has been mapped out. In addition to planting an orchard of the leading commercial sorts grown in the Valley, cultural, fertilizer, and cover crop experiments will be carried on. Thick vs. thin planting will be worked out by keeping close record of the value of the intermediate crop grown, as compared with the closely planted orchard in which no intermediate crops are grown.

There is no bearing orchard on the farm excepting a few scattered trees and to meet the requirements of the growers in their present problems it is proposed to rent an area of four acres in each county, Hants, Annapolis and Kings. These areas have been secured and will be conducted as a part of the Experimental Farm system, giving special attention to spraying, thinning, and fertilizer work. The superintendent is of the opinion that thinning and spraying are the two most important problems in the Valley at the present time and these will receive first attention.

Newly broken land on Experimenta Orchards, Kentville, N.S. Set out with trees and seeded with buckwheat cover crop.

It will be well for Maritime fruit growers to keep closely in touch with the results of experiments carried on at the Valley Experimental Station. We feel confident that Prof. Blair will leave no stone unturned to blaze the way and by precept and example smooth the paths of the fruit growers.

Use Plenty of Hoe on Vegetables.

You ask about my method of vegetable raising. I guess I go about it much the same as everyone else.First I see that my land is well dressed and thoroughly worked and put in my seed as soon as it becomes warm enough. From the time the seed is in the ground I keep on the lookout for weeds; one cannot raise a good crop of vegetables and weeds in the same bed. I keep the hoe and cultivator busy all the season. I am often asked how I raise such good stuff. I tell them by tending to it all the time and having the ground well dressed. The reason so many gardeners fail to get good crops is that they are afraid of the hoe. I have no secret way, only use plenty of hoe.

I have been raising garden stuff for the past eight or nine years and have taken exhibits to fairs and have never failed to get a good share of premiums. At harvesting time I usually sell most of the stuff as I take it from the garden.

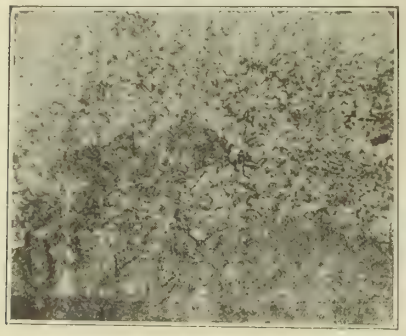
Beets, carrots, squash and cabbage are the most called for and, I think, the most profitable, although I raise a variety of all the vegetables. Last fall I prepared an acre of land with several kinds of fertilizers and will try it as an experiment in the spring.

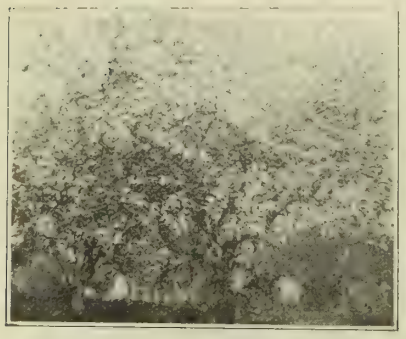
A Kings County, N. B. Pioneer Apple Orchard

Planting for Future Generations

FORTY years ago there were very few commercial orchards in Kings County, as for that matter in New Brunswick. Most farmers had a few trees to grow fruit for their own use but grafting was not widely practiced and many of these were native seedling apples.

The interest in fruit growing was not wide spread at that time and the man who put out an orchard and cultivated it until it bore fruit could not depend on borrowed enthusiasm as at present. And he did not get murh encouragement from his neighbors either. The man who planted trees on his best potato land until the value of growing apples for market was talked about, and sometimes not considered the wise man of the district.

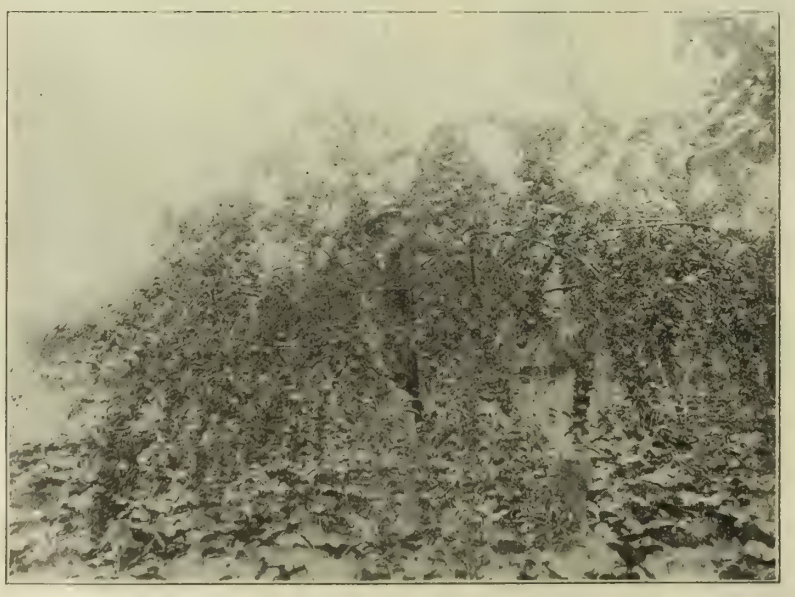




Blossom Time, 1912 in Gorham Orchard

The man who went ahead then and established his orchard and created his market was a true pioneer and like the pioneer in other branches of farm practice he had to learn a good deal from experience.

One of the men who did this pioneer work in Kings County was Jos. Gorham, of Gorham's Bluff, Kingston Parish, as one of the first to establish a commercial orchard in the county and to prove that apples could be made one of the profitable crops of the farm. From different sources he obtained trees and planted them out on his best land, giving them good cultivation, and growing crops between the rows as long as the shading of the trees would permit. The close planting system advocated by F. P. Sharpe, of Woodwhole of the 500 trees were put out 15 by 15 feet. Summer and fall varieties predominated, New Brunswicker, Red Astrachan, Alexander and Fameuse were most largely planted although there were a great many others. As these limited experiences showed that some were less profitable than others recourse was then had to top grafting, changing even tained from Nova Scotia and other points outside the province, topworked on the poor trees and later became distributed through the district. In that way a number of the best varieties like Bishop Pippin, Gravenstein and King of Tompkins were first introduced in the Long Reach district and from ther e upward to the poor trees to better and more profitable varieties. Scions were ob-



A Quarter of A Century Ago in the Gorham Orchards.
The boy in the picture is Mr. A. R. Gorham, the present owner of the orchards.

other points along the Valley.

For thirty or thirty-five years the orchard has been bearing large crops, sometimes going to 800 barrels per year, and one year with another yielding a good income to the owner from the ground occupied. Some of the shorter lived trees are now dying out but the majority look good for another thirty or forty years of bearing.

Jos. H. Gorham, "Uncle Joe" died in 1901 and since that the orchard has been managed by one of his sons, A. R. Gorham, who has won quite a reputation as an exhibitor of good fruit at the exhibitions. He also is doing pioneer work at present in establishing a boxed apple trade on the St. John market. Gorham's Bluff Bishop Pippins and Gravensteins packed in boxes are becoming known on the market and are yielding the packer good returns for his labor and skill.

The Fourth Annual Maritime Horse Show

THE fourth annual Maritime Horse Show held in the Fair Building Amherst, N. S., on the 9th, 10th and 11th inst. marked another milestone in the annals of Maritime horse breeding.

That the citizens of the Maritime Provinces are a horse-loving people was clearly evidenced by the throngs of visitors who came early and stayed late to witness the various events in which the pick and pride of Nova Scotia, New Brunswick and Prince Edward Island equines were exhibited.

Mr. Fred Richardson, Columbus, Ont., and Dr. J. A. Sinclair, Cannington, Ont., placed the awards in the Draft and Light horse classes respectively.

They judged without fear or favor and in cases where the entry did not come up to the requirements for its class they unhesitatingly ruled it out or, if only of an inferior quality in cases of no competition, they awarded second or third prizes only acrording to the merit of the animal shown.

The programme was well arranged by the managing committee and it went off without a hitch so that it did not lag behind and thus the attention of large appreciative audiences was maintained until the close.

THOROUGHBREDS

were few in number, the only representatives of the breed being the aged stallion Bendemeer, the young stallion Busy Amherst and the mare Anna Smith all shown by Geo. M. Holmes, Amherst, N. S.

STANDARD BREDS

were out in full force, Dr. Stewart, the judge, said that the aged Standard Bred Stallion class at Amherst was the second best class he had seen at any Canadian Show.

Seven aged stallions came up for inspection and were tried out on the Amherst streets before the awards were made.

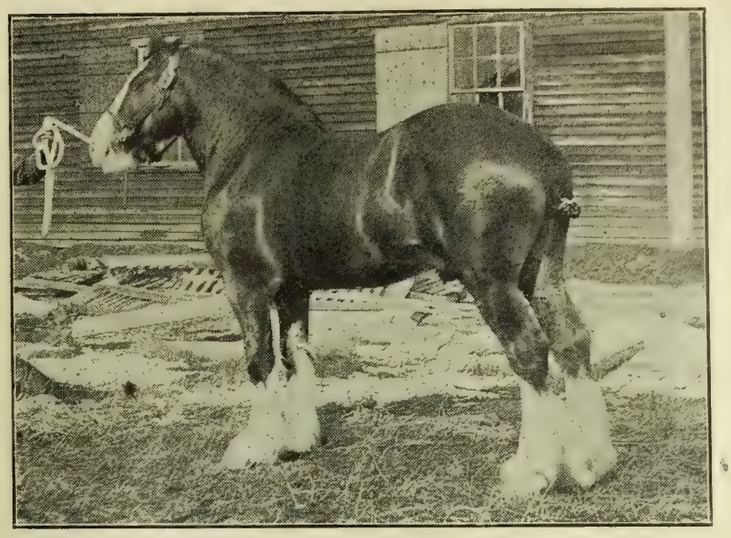
Mayor Todd, owned by Hammond Kelly, Charlottetown, and exhibited by the veteran, P. S. Brown led the field and was followed in second place by King Dodds, a former unbeaten champion, owned by Dodd Dwyer, Pictou, N. S. Royal Autograph, owned by James Hennesey, River Herbert, N. S., and Christian King, owned by Wm. H. Hill, Sydney, came in for third and fourth monies while further down the line and without the money's pale were Baron Cecil, Baron Britt and Right Wilkes all out in the pink of condition.

In the two-year-old stallion class there were only two entries, Silk Bow, owned by S. E. McGregor, New Glasgow, N. S. and Blue Beard, owned by W. H. Curry, Amherst, N. S. They won the red and blue ribbons in their respective order.

Four mares foaled previous to January 1st, 1910, came before the judge. Dina Hartshorn, by Phallaco and driven by her owner D. R. Sutherland, Pictou, N. S. topped the list while in second place was found F. J. Locke's Helen Garcie by Torbrook out of an Israel dam. Lady Buzz Fuzz by Buzz Fuzz, owned by Cecil T. Coates, Nappan, won the white ribbon while the green went to Hugh R. McMonagle's Inheritus by Montrose.

In the three-year-old filly class, Geo. M. Holmes' Miss Sue by Will-Be-Sure and Etter & Lowes' Nellie-Be-Sure by the same sire were placed in first and second positions respectively followed in third place by a mare exhibited by Conductor Coffee, of Amherst.

Song Bird by Achille, owned by T. D. Blaikie, Great Village, N. S., had no competition in the yearling filly class.



BARON SQUIRE.
Champion Clydesdale Stallion at the 1913 Maritime Horse Show.
Owned by McFarlane Bros., Fox Harbor, N. S.

The coveted male and female championships went respectively to Mayor Todd and Dina Hartshorn.

HACKNEYS

were shown by R. A. Snowball, Chatham, N. B., McFarlane Bros., Fox Harbor, N. S. and Rev. R. T. Hawkes, Bartibog, N. B. Snowball's two aged stallions, Model Performer and Cock o'the North captured first and second monies in their class and McFarlane Bros' Sedgeforth Enterprise took third award. Model Performer also captured the purple championship diploma for best Hackney stallion, any age.

Rev. R. T. Hawkes' Signal, by Model Performer had no competition in his class.

Snowball's Langton Lily was the only Hackney female at the show and considering her great age, 21 years, and that she has raised fourteen foals and is now carrying her fifteenth she was out in exceptionally good form and would have stood strong competition.

CLYDESDALES

were as usual one of the main features of the show. Eight aged stallions appeared before Judge Richardson.

McFarlane Bros' Baron Squire by Baron's Pride, Snowball's Baron Belgraddin by Baron Primrose, Fred C. Clark's Labori Again by Handy Andy and Vanderbilt, owned by Clarence A. Brown, Newport Corner, won prizes in the order named while four other good ones, Flash Favorite and Royal Baron's Pride, Royal Flash and Baron Mac were further down in the scale. Baron Squire captued the diploma for best Clydesdale stallion, any age.

Three-year-old stallions were shown by Wm. O'Brien & Sons, Windsor Forks and Geo. E. Fisher, Chatham. O'Briens' Bob McGregor by Norseman out of Jennie Windsor captured the red ribbon and Fisher's Tom Brown by Baron Belgraddin came in in second place.

Nine aged mares, many of them heavy in foal, faced the judge. Logan Bros' [illegible] and Baron's Fancy were finally placed in first and third positions sandwiching McFarlane Bros' imported Bess Spencer by Sir Spencer by Sir Hugo, in second place.

R. A. Snowball's May Lothian and McFarlane Bros' imported Nell Bowie by Golden Chief stood in fourth and fifth places respectively while further down the line were some ratting good ones.

The three-year-old mares' line up had five contestants and the monies went to R. A. Snowball's Moss Rose and Chatham Jeanie, Stewart Etter's Belle Pride and Wm. O'Brien's Belle of Hants.

Snowball's Miss May by Baron Balgraddin and H. B. Pipes' Princess Nora by Norseman were the only competitors in the two-year-old filly class and were placed in the order mentioned.

H. S. Pipes had the first prize yearling filly in Fleur-de-lis by Handy Andy while her only competitor was Kate of Meadow Brook by Baron Belgraddin out of Kate of Barharrow owned by R. A. Snowball.

Logan Bros' Pink Rose was the champion female and thus won Dunlap Bros. & Co's silver cup for best Clyde mare, any age.

PERCHERONS

The Percheron breed was represented by only two aged stallions. Rodrique, owned by the Petitcodiac Horse Company and Embigo, owned by W. E. Barnes, Sackville, N. B., both out in good condition and placed in the order mentioned.

Logan Bros.' Pure Bred Clydesdale Four-in-Hand. Winners of the Arthur Wallace Silver Cup at the 1913 Maritime Horse Fair.

ROADSTERS

were out in full force and some very nice useful horses were included in some of the sections. The stallion section comprised the aged Standard bred stallions referred to in the standard bred class and were placed as already referred to.

There were fifteen entries in the section for aged mares or geldings, 15-2 hands or over. Dina Hartshorn, the first prize standard bred mare captured the red ribbon in the class and also won the silver cup donated by the St. Regis Hotel, Amherst, for the best Roadster, mare or gelding, in harness.

J. C. Purdy's Susie Wilkes, by Abbott Wilkes stood in for second money closely followed in third place by Derby, L. A. Simpson's Clayson gelding. Gesner R. Baker's Happy captured the fourth money and Frank Lock's Helen Gracie, by Torbrook took the fifth and last prize.

Several of the entries in this class were ruled out for being under the 15-2 mark.

The aged mare or gelding under 15-2 class comprised eighteen entries. Lady Buzz Fuzz a Standard bred mare came in for first money; Francis, owned by C. B. Chapman, Amherst, won second award while Queen Brazilian by Brazilian, owned by Alder P. Elderkin, Amherst, stepped into third position followed in fourth and fifth places by Fanny C. owned by Fred C. Clark, Victoria, P. E. I., and Brazil by Brazilian, another of A. P. Elderkin's good ones.

In the three-year-old roadster class Willie, owned by W. S. Reid, Sackville, N. B., Eva, by C. W. Simpson, Amherst, Gyp, owned by H. S. Pipes & Son and Miss Sue owned by Geo. M. Holmes, Amherst, captured first, second, third and fourth awards, in their respective order in a section of seven entries.

Two-year-old fillies were shown by J. M. Crandall, Salisbury, and H. S. Bell, Moncton. Crandall's Lady Kip by Rudy Kip captured the red ribbon and Bell's Fairy B. by Will-Be-Sure carried off the blue. Rudy Kip Jr., a stallion, was shown in this section by Elias White, Amherst but he was ruled out by Rule 6, which he had evidently overlooked and for which ovetsight he was narrow enough to think he had a grievance against the show.

The choicest plum in the yearling section of the roadster class was won by F. M. Blenkhorn's Forest Boy, followed in second and third places by a pair of Rudy Kip colts, Ruby Kip and Goldie Kip, shown by Dr. F. A. Taylor, Moncton, and Miles Wort-Salisbury, N. B. There were eight entries in this section.

A. P. Elderkin's Bess and Rosie, L. A. Simpson's Black Bess and Derby, Etter & Lowe's Dott and Doll and Thos. Munro's Ruritania and Bobs captured the choicest plums in the order named in the matched pair roadster section. Another pair, Brazil and Queen Brazilian, shown by A. P. Elderkin completed the entries of this section.

CARRIAGE HORSES IN HARNESS.

The aged stallions in this class were the same as the entries in the corresponding section of the hackney class and the placings were identically the same.

The section for mare or gelding, 15-2 and over, foaled prior to 1910 had ten entries. Etter & Lowe, Amherst,

(Continued on page 489)

Increased Value of Farm From $900.00 to $15,000.00 in Ten Years

And in the Meantime Acquired A College Education.

AT ROCKLAND on the rocky sides of the South Mountain near Berwick, N. S., is situated the orchard of Judson S. Margeson, one of the most successful orchardists of the Annapolis Valley, and one whose achievements are frequently referred to as an example of what a young man possessing a combination of brains, brawn and undaunted courage may accomplish in the land of the Mayflower.

At the age of twenty-two Mr. Margeson began to think of engaging in

Judson S. Margeson, Berwick, N. S.

business for himself but before doing so he decided to acquire a better education and consequently entered the Berwick High School where he spent two years. After graduating from the High School he was undecided as to his life work. He planned to purchase a ten acre block of land and set the same out in orchard, as an investment. On further investigation he found that by taking the whole place, of 100 acres land would be much cheaper. So he decided to buy the farm en bloc for $900.00, giving in settlement a mortgage for $700.00 and $200.00 cash.

This farm consisted of four or five acres of brook meadow land, twenty acres of old hay land partly over grown with bushees and without rock, one and one-half acres, just set out with 100 trees and the remainder was in very rocky pasture.

For the next four years Mr. Margeson attended the Academy and College at Wolfville, taking partial courses in each. During a part of one year, while at Wolfville he took two hours per week in horticulture. Vacations and many week-ends were spent working on his farm. Circumstances made it necessary for him to board and hire all team work done.

The year after the farm was purchased, Mr. Margeson inherited the sum of $1500.00 from his father's estate he having disposed of his property about that time. This money was used to meet the bills incident to acquiring his education.

NEAR TO NATURE
A Corner of Judson S. Margeson's Orchard, Berwick, N. S.

LOW HEADED APPLE TREES
Judson S. Margeson's Orchard, Berwick, N. S.

During the first year he cleared nine acres, moderately stony for Rockland but exceedingly strong for the Annapolis Valley, on which he set out 900 trees. The second year he cleared eight more acres and set out 800 additional trees. The third year seven acres were cleared and set out with 700 trees, four acres of this was cleared of large bushes. The fourth year six acres were cleared of bushes and rocks and set out with 600 trees.

All the land was plowed once or twice and harrowed, but not fertilized except in the holes where the trees were placed. He used bone meal and phosphate, mixed, a handful of each to each tree.

Trees were set out in hexagonal method so that any way you find three trees or more, they are in a straight line. He used two rows of fillers to one row of standards. The standards are mostly Starks, Northern Spys, Blenheims, Ribstons, Ben Davis and some Tolmans. These last were put in with the intention of procuring good trunks for grafting. The fillers were mostly Wagners and Ontarios.

Mr. Margeson says that if he were doing it again to the same extent, he would use the same method, but plant standard fillers and semi-fillers. But if planting on a small scale the ridges at the edges are of different lengths, and make it difficult for cultivation.

In caring for the trees up to the present time, very little fertilizer has been used, until they began to fruit, but he thoroughly cultivates and plans to harrow after every rain., to keep the moisture in the ground.

Very few cover crops were used as he has been fighting weeds. He does not grow crops in his orchard to any great extent. He has not pruned thus far, but he expects to keep them low and well headed to facilitate picking and spraying and also to avoid less shaking by winds.

Mr. Margeson grows a little grain, but not extensively, in his orchard.

Before building and settling on the farm he had seventeen acres of potatoes planted in his orchard on the halves. The next year he had six acres planted on the halves and the following year he himself planted eight acres. Since that time he has not planted many potatoes and he intends to plant less in the future becuase the seasons, when potatoes are planted, cultivated and harvested are just the times when he is obliged to be busy in his orchards, spraying, cultivating and fruit picking.

When Mr. Margeson had his home prepared, he came to the conclusion that it was not good for man to live alone and so on June 17th, 1908, Miss Mabel V. Jones, daughter of Dr. R. V. Jones, of Acadia University became his bride.

The young couple have established an ideal home and full of faith in themselves and optimism re the future of their productive acres and the possibilities that await the industrious fruit grower they set an example worthy of emulation.

A Panorama of Starr's Point, One of the Oldest Orchard Sections of Nova Scotia, Take Fro

Growing Summer Crops in Winter Season

In the Gravatt Greenhouses, Berwick, N. S.

WHATSOEVER thy hand findeth to do, do it with all thy might." and "Do unto the other as thou would'st that he should do to you" are two adages which will open the gate that leads to the ladder of success for any person who will closely adhere to them.

It would be hard to find a better exponent to those two grand principles in the Maritime Provinces to-day than Mr. Arthur Gravatt, of Berwick, N. S., a name familiar to many of our readers through seeing his advertisements of plants for sale in the columns of the Maritime Farmer.

Mr. Gravatt was born in Walton on Thames, Surrey, Nottinghamshire, England. Early in life he was apprentcied to a gardener and he set about learning the business in all its details. He afeerwards secured employment in the gardens of Sir Oswald Moseley, Rollaston Hall, Straffordshire where he arose from the ranks of two hundred gardeners employed on the estate to be second man in command and where he received fair wages for his services.

Sickness in the family and heavy doctor bills, however, made heavy inroads into his income. The sick one was finally placed in a hospital where she began to improve in health and where Mr. Gravatt was advised to take her away to some other clime as soon as she would be sufficiently recovered to stand the journey.

Consequently, Mr. Gravatt turned his face towards Canada, the land of the promise, to prepare a home for himself and family.

About eight years ago he landed in Nova Scotia and went to Kentville but after failing to obtain employment he went on to Berwick and arrived there with his income reduced to his last copper. Had he been possessed of sufficient funds when leaving Kentville it is more than likely that he would have gone to the West and Nova Scotia would have lost one who has since become a good citizen.

Arriving in Berwick in the spring of the year he hired out for $20.00 per month and board and in the fall he was able to sent to England for his wife and family. During the first winter he took his first lessons in fruit packiag, working in the warehouse for eight cents per hour, but he was willing to learn.

The second year he worked as manager of a farm, and the third season he took the farm on shares and the fourth season found him with a rented orchard with which he was successful in making fair profit.

While working along in this way he did a considerable trade in market gardening by working with cold frames before and after hours. He was ridiculed at first but ere long the success he was attaining made people look at his industry in a more favorable light. For several years he worked on an average of about 20 hours per day, but he was interested in his work and bound to make good.

DOUBLE DECKERS HEAVILY LADEN
Another Scene in Jndson S. Margeson's Orchard

Apple Picking in Judson S. Margeson's Orchard

The farm which he now owns was then in the hands of a man who was not making very fast progress towards wealth with his greenhouse plants. Seeing the good work done by Mr. Gravatt with his crude equipment the owner invited the latter to come with him and conduct the business on shares. He agreed to do so under a five year contract and soon the tide began to turn in his favor. Then the owner of the plant offered to sell his interest to Mr. Gravatt who tackled the $3,500 proposition without money. Some friends who had been keen observers of his integrity came to his assistance and the property passed over to Mr. Gravatt. He has met his payments as they matured and was always ready to look after accrued interests. In this way he kept faith with the friends who had endorsed his paper and gradually he has worked off the heavy financial load.

Last year he marketed 1200 baskets of tomatoes. The green sold for 40 cents and the ripe went for 60 cents per basket. He had been told that he could not find a market for cucumbers but last year he grew half an acre of them and sold the produce at $25.00 per ton to the McCready Co., of St. John.

Wishing to get more capital to extend his business he formed a Joint Stock Company and with the added capital he has gone forward and built the most modern green houses in the Maritime Provinces. The new

A. Gravatt, Berwick, N S.

houses cover an srea of about one-half an acre. They are heated and watered by the most modern devices. The various plants grown are set in the ground in these buildings. Instead of the laborious spading system comcomly used, the buildings are so arranged that the ground area may be plowed and harrowed by horse power.

The old glass houses have also been overhauled and a better heating system has been installed.

The total area under glass on Mr. Gravatt's farm is now about 1½ acres. Every kind of vegetable and plant for which there is a demand in Maritime markets are grown. Halifax, the Sydneys and the summer hotels throughout western Nova Scotia furnish a ready market for all the produce he can grow.

At the time of our visit to Mr. Gravatt's plant we were informed that just before Easter he had ship-

DISPERSION SALE OF

High Class and Show Ayrshires

We purpose dispersing our entire herd of pure bred and Grade Ayrshires now on our farm at

FOREST GLEN

Westmorland Co., N. B., on

Friday and Saturday, May 23 & 24

A strict record has been kept of each and every cow in the herd and as the food consumed by each cow has been charged against her production, boarders were quickly spotted and disposed of. This rigorous record keeping and weeding has brought the herd up to a good average producing capacity.

Terms : Under $50.00 Cash. Over that amount notes will be accepted with approved security, bearing interest at 6 per cent for four months.

Sale will begin at 11 o'clock. Luncheon will be served.

For nearly four years this herd has been headed by the richly bred bull "St. Louis King"--27094--a son of the noted Show bull and dairy sire "Pearlstone of Glenora" a many times winner in Canada's leading exhibitions and in 1909 was selected by A. S. Turner & Sons to head their world famous dairy herd at Ryckman's Corners, Ont.

The dam of St. Louis King "Vera of Kelso" is one of a family noted as producers and showring winners, her full sister Lily of Kelso was winner of the Canadian bred class at Sherbrooke, Que., 1909.

St. Louis King is of good size, ideal dairy type and conformation, and a look at the 30 or more of his offspring in this herd (or sale) will convince the most critical that he is breeding true to type and dairy conformation.

—EMPIRE—

Cream Separator

Prices of wheat and other products are uncertain, but prices for dairy products are steadily rising. No wonder the tendency in the Dominion is more and more in the direction of dairy farming.

The following statement is only one of many showing the loyalty to EMPIRES that is found in every dairy community:

"Grandmother was proud of her EMPIRE Cream Separator. Father and his brother have EMPIRES. I and my brother and two married cousins each have an EMPIRE. No other pays so well or gives the satisfaction our folks have had with EMPIRES

This statement, and many others, shows the loyalty to EMPIRES in every dairy community.

Our factory is running nights because EMPIRES are superior and are in great demand, The public is paying this compliment only to EMPIRES.

Annapolis Valley Fruit Farm
Overlooking the Minas Basin

62 acres with 475 choice apple trees, a splendid opportunity to develop large commercial orchard; 55 acres machine-worked tillage; splendid 9-room house with 36-ft. piazza; barn with tie-up for 12 head; carriage house; owner a merchant has no use for the farm; located in a thrifty town where in a few years farm will cut into bldg. lots, going now for only $5300, part cash; for full details and traveling instructions to see this and other farms in many different sections, see page 67, our "New Mammoth Farm Catalogue No. 36," just out; beautifully illustrated and filled with a wonderful assortment of money-making farms, send today for your free copy, it will save you lots of time and money. Box D. Sussex, N. B.

Fourth Annual Maritime Horse Show.

(Continued on page 485)

captured first and fourth monies with their Nip and Tuck. Elderkin's Pilot stood in second position, H. S. Dupuy's Glyn was third and Peel Bros. from Oxford captured the fifth award with Dick.

Gypsey, owned by J. C. Purdy, Amherst, Gipsey, owned by A. P. Elderkin and Rex owned by Geo. M. Holmes put up a three cornered contest in the under 15-2, carriage horse foaled prior to Jan. 1st, 1910 class and were placed in the order named.

Carl Ripley, Maccan, had the only entry in the section for carriage horse three years old. But as he was not up to class he was only awarded a second prize.

There were four entries in the matched pair section. A. P. Elderkin carried off the first money with Pilot and Gypsey. Etter & Lowe's Nip and Tuck were placed in second position and Geo. M. Holmes and W. B. Strang's pairs captured third and fourth monies respectively.

SADDLE HORSES.

In the saddle horse ridden by gentlemen class there were seven entries and as they walked, trotted or cantered around the arena they put up a very natty appearance. Logan Bros' Starlight led the class. A. P. Elderkin's Pilot came in in second place followed in third and fourth positions by Geo. M. Holmes' Anna Smith and C. B. Embree's Tom.

Gypsey, owned by J. C. Purdy and ridden by Miss Blanchard, of Kentville; Gipsey, owned by A. P. Elderkin and ridden by Miss Robertson and Timbrook owned by Geo. M. Holmes were the only entries in the placed in the above mentioned order.

Holmes' Anna Smith by Sir Simon topped the hurdles in the leaper class Ladies' saddle horse class. There were W. H. McLellan's Everill was the second highest jumper and Tom owned by C. B. Embree could not rise higher than third position.

J. C. Purdy's Francis ridden by Miss Blanchard was awarded first prize in the leaper ridden by lady class. The other horse entered in this class refused to take the hurdle.

There were four entries in the section for carriage mare or geldings 15-2 hands or over. Two of these were disqualified for unsoundnesses and the remaining two, Starlight, owned by Logan Bros. and Prince, owned by A. P. Elderkin were placed in first and fourth places respectively.

Mares or geldings under 15-2 hands were shown by A. P. Elderkin and Geo. M. Holmes and the red and blue ribbon were placed accordingly.

A. P. Elderkin with Prince and Bonny, J. C. Purdy with Susie Wilkes and Gypsey and Geo. M. Holmes with Harry and Timbrook were the only contestants in the matched pair class and were placed in their respective order.

Five carriage tandems were entered. The first and second team winners were also winners in this section with Etter & Lowe's Nip and Tuck in third place.

A. P. Elderkin, J. C. Purdy and Etter & Lowe were exhibitors of carriage four-in-hands and won out in the orchard mentioned. The three quartettes put up a very creditable showing. Elderkin had four jet blacks, Purdy had a pair of chestnuts as a wheel team with a pair of blacks for leaders while Etter & Lowe's quartette was made up of four well balanced chestnuts.

The Terrace Hotel silver cup for champion carriage horse in harness was won by Etter & Lowe's Nip.

Lieut. H. Montgomery Campbell's silver cup for champion carriage and saddle horse was presented to J. C. Purdy, the winner, by Mrs. Camp-

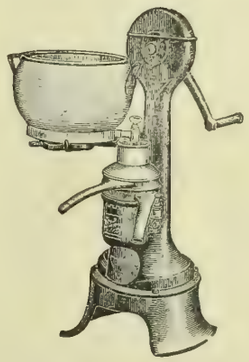
Why You Will Prefer

The WATERLOO BOY

in preference to all other cream separators is because the "Waterloo Boy" is



So Simple
So Easy to Turn
So Easy to Clean
So Perfect in Skimming
So Quick in Separating
So Pleasing in Appearance
Seldom out of Repair
Soon Pays for Itself
LASTS A LIFE TIME

There are other advantages in favor of the "Waterloo Boy." These are explained in our literature, which will be mailed to you free on request.

The ease of running, ease of cleaning, simplicity, interchangeable spindle point, low-down supply can, general pleasing appearance and perfect skimming of the "Waterloo Boy" MAKES IT A FAVORITE EVERY WHERE IT GOES.

Then, too, our large capacity machines, so constructed that they turn more easily than most other separators, regardless of capacity, will enable you to separate YOUR MILK IN HALF THE TIME- This is a great advantage it will pay you to enjoy.

Bear in mind we allow you to prove all these claims—since "The Proof of the Pudding is in the Eating."

Write us for full particulars about the "Waterloo Boy" and our special terms to you to use the "Waterloo" and represent us locally in your district.

The Apple

I PRESUME it is conceded that apples are grown and eaten for profit and pleasure. It is the most widely grown and known of all tree-fruits. According to Mr. W. T. Macoun, the origin of the cultivated apple is surrounded in mystery. It is supposed that it had its beginning in the wild apple of Europe. Our fancy grade commercial varieties bear scarcely any resemblance to the very small, woody, fruit of the wild parent, so long has been the process of evolution. Although the early settlers brought with them the seeds of of this attractive fruit, it is only within a generation that apple culture has made rapid progress. Mr. Macoun thinks there are now, probably, considerably over 2,500 named varieties.

To the present generation of apple growers it is surprising, that until recently, orchards were starved, pruning was barbarous mutilation, and the value of spraying, and thinning unknown. To the writer, it would be equally surprising if the successful producer did not derive pleasure as well as profit from his orchard. The problem confronting the fruit-growers of the Maritime Provinces is the desirability of producing fruit of the finest quality that will not suffer in comparison with the finest fruit of other countries.

If, as Mr. Alex. McNeill affirms, co-operation is the secret of success at the marketing end of the fruit-growing industry, we may rest our cases there, as far as the selling of our fruit is concerned, (Nova Scotia leads the rest of Canada in the practical adoptionof the principle of co-operation in the marketing of apples). But what about the producing end of the business? The apple will be in great demand as long as growers con-

tinue to produce commercial varieties. Cultivation, as well as improved methods of transportation, storage, and marketing, is essential, in view of the demands of the markets. Discriminating purchasers and consumers desire and demand fruit of good appearance, flavor, texture, and keeping qualities. They desire and demand the best. The market returns and reports confirm my opinion that when fruit of the finest quality, properly graded, and packed, is offered for sale, the price will be satisfactory. Surely the lessons of the selling and shipping season just closed will have a salutary effect upon our friends. I am disposed to think that there will inevitably be an over-production of inferior fruit each year, as long as apples are improperly guarded and packed. I venture to express my firm conviction that in producing fruit of the finest quality, properly graded and packed, we shall never have to face the problem of over-production. I cannot conceive of such a condition in consequence of a large and increasing supply of fruit of the desired variety and quality. Permit me to repeat the demand for choicest apples, in sound condition, and graded according to the requirements of the law, will always exceed the supply.

And, why this sustained demand? My reply is; because of the fact that the apple is both delicious and nutritious. The apple is eaten for pleasure and profit. It is no longer regarded as a luxury, but as a necessity, as a brain and muscle producer. "An apple a day keeps the doctor away." As an article of fruit-diet it has no superiors, and but few equals. Altogether, apart from its pleasant flavor, it has a distinct food value. A great deal could be said in favor of a fruitarian diet in general, and an apple diet in particular.

In this connection I refer my readers to "Farmers' Bulletin 293," U. S. Department of Agriculture. This Bulletin is a summary of all available data on the composition, food value, and place in the diet of all fresh and preserved fruits, I quote from the Author's conclusions;—"In general, it may be said that fruits are wholesome, palatable, and attractive additions to our diet, and may be readily made to furnish a considerable part of the nutrients and energy required in the daily fare. The characteristic chemical constituents of fruits are carbohydrates, and so they are naturally and properly used in a well-balanced diet to supplement foods richer in protein, as cereal grains, legumes, nuts, eggs, dairy products, meats, fish. Fruits contain considerable mineral matter, and as they dilute foods they may be added to the diet to supply iron and other mineral constituents without unduly increasing the supply of protein and energy. Intelligently used, fruits are a valuable part of a well-balanced diet and may even be eaten in larger quantities than at present.

I conclude this desultory talk by quoting lines on

MY APPLE TREES.

My apple-trees from winter's chill
In springtime waken with a thrill,
While vital currents start and run
With every day of climbing sun,
Till south-wind voices woo and call
To leaf and blossom carnival.

My trees note how the seasons go
From summer bloom to winter snow:
Their youthful graces lithe and slim
Are grown to burly trunk and limb
Through wondrous gift of magic rings
The oft-repeated summer brings.

Within their shade the robin builds,
The catbird sings, the thrasher trills;
The green leaves turn and whisper low
Such secrets as the south winds blow,
And lull to sleep and quiet rest
The dreamers in the robin's nest.

I lean against the rugged grace
My wide-spread arms may not embrace,
And muse on all the summer flown,
The forms of beauty made my own.
While clouds of bloom and humming bees
Make glad my spreading apple-trees.

My faith is quickened when it sees
The blossoms on the apple-trees,
The promisr fair, the certain clew
To fruitage since the world was new,
Such hoarded sweets of sunshine warm
To glad the heart of winter's storm.

The harvest that my orchard brings
Is better than the wealth of Kings;
The dreams, the rest, the quiet joy,
And peace to heal the heart's annoy—
Such joy upon his head may be
Who lives to plant an apple-tree.
—G. Bryant, Berwick, N. S.

Renovating a Neglected York County Orchard.

(Continued from page 479.)

than picking. The season was very wet and hard on fruit but nevertheless it gave returns of over $700.00, giving a profit, he told us, over and above expenses of $512.62.

Mr. Hawkins is firmly of the opinion that the time is not far remote when the St. John river farmers will know that they can raise as good fruit as can be grown anywhere in Canada, if the people will allow themselves to be educated in proper method.

Mann, Star and Golden Russett Trees in blossom in 1912.
Photo by F. A. Bolser.

Mr. Hawkins' orchard prior to 1911 was an example of the kind that are all too commonly found throughout the Maritime Provinces. In the short period of two years it nas been transformed, through careful management, and is an example of what the average farmer may accomplish in the fruit growing line if he heeds the instructions which are now so readily available.

SURE TO BE SAFE
When You Select
Maple Leaf Paints & Varnishes

for your painting and finishing Do not select them for their excellence of color alone, nor merely because they cover better and wear longer than other paints and varnishes. Choose them because they protect the best, and preserve property longest. That is why they pay. That is why their use means service and money saved.

Your choice will be safe, your investment sure if you ask your dealer for the Maple Leaf Brands.

Fourth Annual Maritime Horse Show.

(Continued from page 489)

bell. Mr. Purdy won this trophy in 1912 and again this year on his trappy Gipsey.

HEAVY DRAUGHT PURE BREDS.

There were eight entries in this aged class for pure bred heavy draught mares or geldings, all Clydesdales. Logan Bros. with Pink Rose and Princess May captured first and third places while McFarlane Bros' Bess Spencer was sandwiched in in second place. R. A. Snowball's Marionetta captured the green ribbon.

There were just enough prizes to give each of the exhibitors a share in the three-year-old pure bred heavy draught class. Snowball's Moss Rose, Stewart Etter's Bell Pride by Pride of Windham, and his Soubrette of Homestead by Handy Andy and Wm. O'Brien's Bell of Hants by Norseman came in for the first, second, third and fourth prizes in the order named.

Logan's Pink Rose and her mate Baron's Fancy, Snowball's May Lothian and Marionette and McFarlane Bros' Nell Bowie and Bess Spencer carried off the honors in the aged heavy draught pure bred team in harness class.

Snowball's Moss Rose and Chatham Jeanie led the way in the three-year-old heavy draught team class, and were followed in second place by Etter's Bell Pride and Soubrette of Homestead.

The Arthur Wallace silver cup for the best pure bred heavy draught four-in-hand was presented by Mrs. Wallace to Logan Bros, who won the trophy in 1912 and again this year on Pink Rose, Baron's Fancy, Princess May and Polly McGregor, a splendid quartette of Clyde mares of which their owner may justly feel proud.

THE HEAVY DRAUGHT GRADES

were a particularly useful lot and showed what splendid farm teams our farmers could have if they followed one line of breeding for some years. Nearly every animal shown in this class was the progeny of a pure bred Clydesdale sire.

Fowler Bros.' Minnie and Mayor by Prince of Annick led the way in the section for heavy draught mares or geldings in harness, foaled previous to January 1st, 1909. W. P. Keilor's King followed in third position. Any one of the three could stand more competition.

The four-year-old section of the heavy draught grade class was represented by T. W. Keilor's Sue, by Vanderbilt and W. P. Keilor's Queen. Queen captured the red ribbon.

Sandy and Nancy, by Prince Alert, shown by Ronald Rutherford, River Herbert, had no competition in the section for three-year-olds. They are a pair of useful colts and were placed in the order named. The same pair had no competition in the team in harness class.

Fowler Bros.' Minnie and Mayor led the team class with W. P. Keilor's King and Queen a good second.

There was only one entry in the two-year-old draught grade class but as it was not good enough for first prize, Judge Richardson only awarded him third money.

The silver cup donated by the Amherst Hotel, Amherst, N. S., for the best heavy draught grade four-in-hand was awarded to Etter & Lowe on a quartette consisting of Fowler Bros.' Minnie and Mayor and Keilor's King and Queen.

CLYDESDALE GRADES.

The special prizes offered by the Canadian Clydesdale Horse Association for the get of registered Clydesdale stallions were awarded as follows:

WOMEN CURED AT HOME

Women's disorders always yield from the very beginning of the treatment to the mild, but effective, action of Orange Lily. Within two or three days after commencing its use the improvement becomes noticeable, and this improvement continues until the patient is completely cured. Orange Lily is an applied or local treatment, and acts directly on the womanly organs, removing the congestion, toning and strengthening the nerves, and restoring perfect circulation in the diseased parts. In order to convince all suffering women of the value of this remedy, I will send a 35-cent box, enough for ten days' treatment, absolutely FREE to each lady sending me her address. MRS. FRANCES E. CURRAH, Windsor, Ont.

harness, foaled previous to January 1st, 1909—1 and 2, Fowler Bros. on Minnie anh Mayor by Prince of Annick; 3, W. P. Keilor's King by Honesty; 4, J. R. Embree's Champion.

Mare or gelding shown in single harness, foaled on or after January 1st, 1909—1, Walter Bullmer's Dan, by Vanderbilt; 2, W. P. Keilor's Queen by Hercules; 3, Chas. M. Shipley's Topsy by Vanderbilt; 4, T. W. Keilor's Sue.

Team in harness foaled previous to January 1st, 1909—1, Fowler Bros.' Minnie and Mayor; 2, W. P. Keilor's King and Queen.

Ronald Rutherford's Prince Alert colts had no competition in the class for young teams.

They also won first and second prizes in the class for singles foaled on or after January 1st, 1910 and Elbert Black's Nellie Grey by Vanderbilt was awarded third money.

GENERAL PURPOSE.

The general purpose singles were ten in number and the following prizes were awarded:—1, R. A. Snowball; 2, Peel Bros.; 3, Fowler Bros.; 4, W. E. Barnes.

Peel Bros. led in the general purpose team class, followed in second place by S. M. Styles.

AGRICULTURAL.

Aged mare or gelding, nine up—1, and 2, Etter & Lowe; 3, J. R. Embree; 4, C. B. Embree.

Four-year-old aged mare or gelding, a quartette—1, Walter Bullmer; 2, C. M. Shipley; 3, Jas. E. Goold; 4, Henry Donkin.

Of this number at least three were by Vanderbilt whose get are proving to be valuable farm horses. Vanderbilt is now owned by C. A. Brown, Newport Corner, N. S.

Two-year-old mares or geldings, four entries—1, Geo. M. Holmes; 2, Wilson Beatty; 3, Elbert Black; 4, Chas. M. Shipley.

The class for yearlings brought out six entries which were placed as follows:—1, Geo. M. Holmes; 2, W. F. Beatty; 3, W. E. Barnes.

Matched team—1, Etter & Lowe; 2, J. R. Embree; 3, C. B. Embree.

PONIES.

Pony in single harness, under 12 hands—1, Thos. Hooper, Truro, N. S.

Pony in single harness, 12 hands up to 13-2 hands—1, Arthur Wallace, Pictou, N. S.; 2, Helm, Amherst.

THE HAULING COMPETITION

brought out a strong class of powerful equines in both single and double sections.

The single awards went to:—1, F. S. Black; 2, W. F. Beattie; 3, W. O. Bowser.

Black's horse hauled 2795 pounds.

In the doubles' section the winner of first and second prize was W. F. Beatty, whose team hauled a total of 3740 pounds.

Meals!

LOTS of home baked bread, cake and pastry are always welcome. But baking is not *always* an easy job. Perhaps we can help you. Here is a truth backed by honest *proof*.

Help:

Regal Flour readily yields the *best quality* and the *utmost quantity* of bread per barrel of any flour in the world. Makes light, white loaves. And *such* meltingly flaky pastry.

Proof:

Try Regal once. If it is not just as good as we have promised, your dealer will return your money. We then have to pay him back. So unless you like Regal we lose completely. Isn't it fair to expect that Regal will mean easier, nicer meals?

FARMER ADS BRING RESULTS

The Farm Kitchen Garden.

(Continued from page 478.)

be planted in well prepared soil in double rows about four feet apart and six inches apart in the rows each way. These double rows are more economical for blanching with boards and with this method we always use the early self-blanching varieties. To blanch with boards set on edge along each side of the row of celery and bring it in close at the top to about three or four inches to exclude all light and support boards by stakes. If it is to be blanched with earth set the rows singly about 4½ feet apart and the plants six inches in the rows. Celery must have thorough cultivation keeping all weeds down until it would be large enough to smother the weeds itself. When it is about 10 in. high we start to draw a little earth up to the plants taking care

Photo by F. A. Bolser.

that none gets into the hearts as it would cause it to decay. The late or tall varieties we keep growing longer and before danger of heavy frosts is at hand we store in a good cellar or pit. A cellar which has a dry cool air overhead and moisture around the roots is what is needed most so that the plants won't shrivel up where they will keep on blanching through the winter.

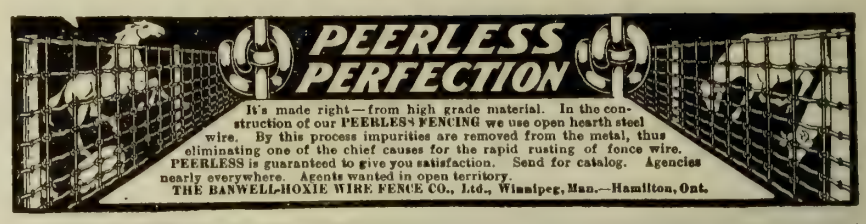
Cabbage is another plant that should be grown in the garden. For early use the seed of some of the early varieties should be sown in a gentle or moderately warm hotbed about the first week in April. When they have shown their second leaf they should be transplanted into another cold frame and when large enough hardened off preparatory to planting outside. The ground should be well prepared and enriched with

Another Years Showing in an Orchard that has an Unbroken Record of No Faliure for 8 Years in succession and does not plan to fail Next Year.
Photo by F. A. Bolser.

plant food. Thorough cultivation should be given to conserve moisture without which a good crop is impossible and sometimes means the difference between success and failure.

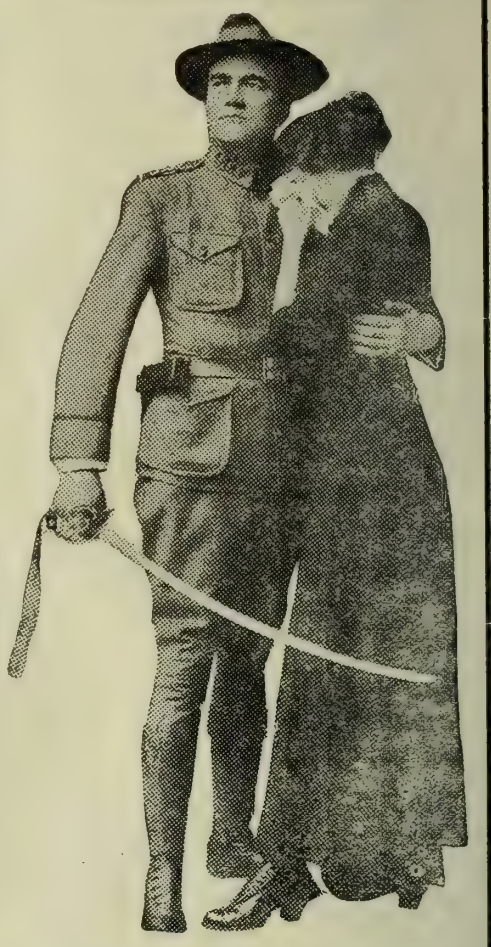
For the late crop the seed can be sown in a cold frame when danger from frost is past. It is better to sow rather thinly to avoid the necessity of transplanting to another bed. When they are large enough, transplant to the open field and cultivate the same as for early crop.

Cauliflower is cultivated about the



For New Vitality Send Me The FREE COUPON

There is to-day no excuse for any man remaining weak. The vital, manly man is admired by all men as well as all women; there is an influence about him no one can resist; he knows no fear; he knows no weakness; he knows no result of debility. It is this same VITALITY which carries our young soldiers to war without thought of death. Vitality, reader, is what you MUST have if you would enjoy a life of health, strength and manly vigor. I can give you this same life and vitality; if I can do for you what I am doing for thousands of others I can put the vigor of youth into your blood and nerves; I can make you feel young again and keep you feeling young; I can drive away all dibility, weakness and despondency. You will laugh at trouble, you will tackle obstacles with the vim to win, just as all other hearty vital men may do. I don't ask you to use drugs. I ask no change in your present mode of living; just cease all dissipation and then use my HEALTH BELT. All else will come. My Health Belt with suspensory attachment is the greatest nature cure and VITALITY supply that the world has ever known or probably ever will know. Nothing is taken for granted: you feel better immediately, at once, from the first time used. Worn all night, while you sleep, it pours a great stream of Vitality and energy into your weakened system: it is a wonder-working giant of power; made as I now make it, I am getting results of which no man ever dreamed. Just think, over ten thousand men applied to me during the month of February. I am now sending great shipments of my Health Belt to every part of the civilized world. There is a reason, I am curing; I am giving men back their lost strength. It makes you feel ambitious, full of vim; you awaken mornings sparkling with bright, clear-eyed, clear-brained health; the weakness has all disappeared from your back; you are "just feeling fine." Special attachments to my Health Belt cure rheumatism, kidney, liver and stomach trouble.



Let Me Send You THIS BOOK Free

Fill in the coupon; let me send you at once my free booklet in plain sealed envelope; it is profusely illustrated with half-tone photos; keep it in your pocket for easy reference; read the chapter on Vitality; read the chapter on Debility; read the chapter on those subjects which interest every man, young or old, who would be strong in manly vigor. It is a word of hope, a carefully written, interesting booklet, which should be in everyone's possession. Therefore, send to-day. If in or near the city, call at my office.

Photo by F. A. Bolser.

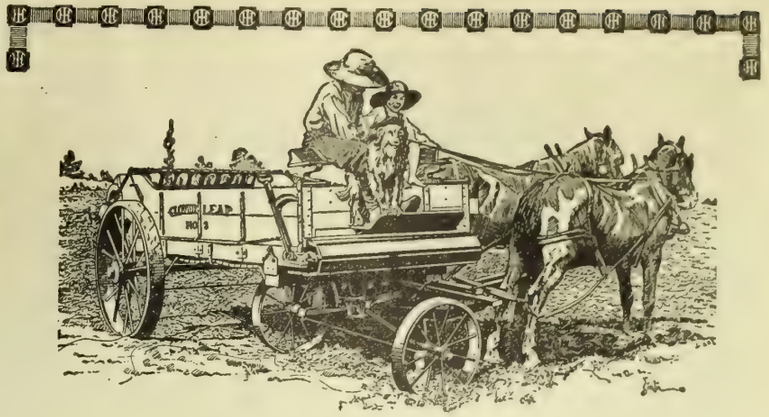
same as cabbage but requires ground a little more moist and richer in plant food as it is more easily checked in its growth. It requires thorough cultivation in ground well prepared. When the head comes to maturity and if too many come in at once to be used up at one time a good plan is to fold some of the outer leaves over the head, to exclude all the light to keep it white. The early varieties are best to be grown in this country and last but not least secure the best seed that can be got, as it plays a very important part in the future success of the crop.

Cucumbers succeed best in a well sheltered spot and should be planted in hills when the weather becomes warm enough, about 4 feet apart. It is well to add a shovelful or two of well rotted manure and thoroughly mix with the soil. Sow about 8 seeds to a hill and when all danger from insects is past thin out the weakest plants leaving about four of the best to come to maturity. All fruits should be gathered when ready whether it is required or not for if left on the vines to go to seed will lessen the productiveness.

Tomatoes should be started about the last of March in a hotbed, in a nice light, loamy soil. When they get their second leaves they should

A Crab Tree in Blossom
Photo by F. A. Bolser.

be pricked off into another hotbed where the heat is less than in the first, about 4 in. apart each way and kept growing nicely until planting out time. About three weeks before planting out time they should have been started to be hardened to the conditions of the open field, where they should be planted to a distance of 3 feet apart in hills adding about a teaspoonful of Nitrate of Soda to each plant which will give it a good start. A dull day is preferable for planting in the field. To secure early fruit it is best to grow the plants to a single stem pinching out all side shoots, as the strength that would go into those shoots will go into the fruit and it will mature quicker than if they are left to grow at random. If grown to a single stem they can be planted about 20 in. apart in the rows with the rows 3 feet apart. Use the early maturing varieties, such as Earliana and Early Ruby.



Land Value Almost Doubled

IT is no longer an unusual thing for us to get reports from farmers who have been using manure spreaders properly and consistently for periods ranging from three to five years, to the effect that the land on which the manure spreaders have been used is regularly raising so much more produce that the value of the land is almost doubled.

"The beauty of it is," writes one Ontario farmer, "that the increased fertility seems to be permanent. Dry weather has less bad effect on our crops now than it used to, the soil is much more easily worked, making the day's work easier both for the horses and for the men, it is less trouble to raise better crops, and we are a good deal surer of good returns since our soil was built up by the use of an

I H C Manure Spreader

I H C manure spreaders, **Corn King** or **Cloverleaf,** are made in various styles and sizes to meet any and all conditions. There are wide, medium and narrow machines, all of guaranteed capacity; return and endless aprons; in short, a spreader built to meet your conditions and made to spread manure, straw, lime, or ashes as required.

I H C spreaders will spread manure evenly on the level, going up hill or down. The wheel rims are wide and are equipped with Z-shaped lugs, which provide ample tractive power without jarring the machines excessively. The apron moves on large rollers. The beater drive is positive, but the chain wears only one side. The I H C agent will show you the most effective machine for your work. Ask to see an I H C manure spreader. You can get catalogues from him, or, if you prefer, write the nearest branch house.

Growing the Market Cucumber.

I always devote part of my farm to cucumbers, which I have found profitable as a market crop. Whenever possible I choose a well-drained, sandy loam which has been in clover sod the previous year, as the plants grow faster upon such a soil than in a soil less light and less well suppliedwith humus.

The ground is harrowed well, first with a disk, then with an acme harrow. It is then marked out in checks 4½ feet each way. I prefer having cucumbers in hills, as this method gives the plants more leaf surface than when the seeds are sown in the single row system. It is also easier to cultivate check rows than single rows. After marketing the ground is furrowed out one way with a one-horse plow set deeply. A large shovelful of fine hog manure is then placed in each hill. If such manure is not available I use well rotted stable manure, but I always get better results from the former. I never use commercial fertilizers on cucumbers. Planting is always deferred until after danger from frost has passed.

In planting, I always go at right angles to the way the rows were followed, thus insuring straight rows in both directions. Six or eight seeds are dropped in the hill, which is made by treading the ground firmly before the seeds are dropped. The seeds are then covered lightly with earth. When they sprout a second planting is made alongside the first, so that should unexpected unfavorable weather arrive the second showing will be unhurt and a stand of plants secured. If the weather continues unfavorable a third showing is made several days after the second.

Several insects are often troublesome with cucumbers. For cutworms I use poisoned bran about four inches from where the plants are coming through. For striped beetle I dust frequently with plaster, which acts as a repellant. When the plants get their rough leaves they are thinned to two in a hill, after which they are kept clean until the vines meet, when they are cultivated for the last time.

During the picking season the vines are gone over regularly at short intervals and the cucumbers removed as soon as they attain marketable size. This prevents any check in the growth of vines that may follow neglect in remouing premature fruits. It also increases the number of fruits that can be secured from the individual vines.—South Jersey Trucker.

Save Money on Butter Parchment.

The Maritime Farmer's co-operative system of selling butter is bringing in orders by wholesale. The users of pure butter parchment are realizing that this offer means the saving of considerable sums to them, as well as giving them a pure parchment paper that will not ruin their butter. So many imitations have been offered from time to time, on the plea that they are just as good as pure paper, that customers in many sections have only understood the difference when confronted by losses occasioned by the use of inferior parchment paper. The parchment offered by the Farmer is brought direct from Germany and every sheet of it is guaranteed. By buying in large quantities from the best mills of the world, the Maritime Farmer is able to give its customers the benifit of a large saving. A postcard addressed to the Maritime Farmer will bring full particulars to your address. Write to-day and save money on wrapping of your dairy output. The Maritime Farmer supplies printed or plain parchment in all sizes.

Seasonable Spraying Suggestions.

(Continued on page 481)

drenching every leaf, every fruit, every twig, every branch. This can be much more easily done and quickly accomplished with a high pressure power sprayer, but it can also be accomplished by a hand pump.

Thorough spraying not only results in in better fruit but in more fruit. There are two causes for the "June drop"—lack of fertilization of the blossoms, and lack of thorough spraying. Where spraying has been carelessly done apple scab often attacks the stems of the blossoms and the young fruit and in such a case no fruit can develop on those stems.

Entomological Laboratory for N. S.

The Dominion Entomological Laboratory, at Bridgetown, N. S. was opened in the spring of 1912 for the purpose of studying under local conditions the more injurious insects of the province.

The station consists of a two roomed portable house fully equipped for the breeding, study and preserving of insects. A separate breeding room is being constructed at present for work on the Brown Tail moth.

Experiments in hand consist of one large spraying experiment to determine the best dates of speaying for the green fruit worm and the Budmoth. In connection with these the life histories, parasites, amount of damage normally done in orchards cared for in various ways and other points which may be of possible value will be worked out for both species. Three other orchards will be under observation during the coming season to determine the value of cultivation on the green fruit worm.

The native parasites of the Brown Tail moth will be bred at the laboratory during the coming season and a number of parasites now established in Massachusettes will be imported and colonized. This work will also be done with Gipsey moth parasites. Although Gipsey moth is not in Nova Scotia at present it seems only a matter of time until it arrives and if its parasites can be established here on the native caterpillars before it arrives, its control when it does come will be so much easier.

During the season of 1912, the San Jose Scale was discovered in the Annapolis Valley by the Field Officer of the Division of Entomology, stationed at Bridgetown and it is owning to its early discovery that the efforts to exterminate the pest owe their chance of success. The Apple Maggot was also discovered for the first time in Nova Scotia in an orchard in Digby county and will be studied locally as soon as an opening can be found in the program.

The experiments on both Budmoth and Green fruit worm have up to the present given particularly gratifying results. These results will be verified during the coming season and when made public will enable the fruit growers to fight these two pests more intelligently and economically.

The laboratory at Bridgetown is the only station of the Division of Entomology in Nova Scotia and is directly under the supervision of Dr. C. Gordon Hewitt, Dominion Entomoligist. George E. Sanders, the Field Officer at the Laboratory, is in immediate charge of the breeding and experimental work and during the winter also has charge of the combined Dominion and Provincial Brown Tail moth inspector.

Mr. Saunders is a native of Nova Scotia. He graduated B. S. A. in Biology at Guelph. After graduating from the O. A. C. in 1907 he was employed by the Illinois State Department of Agriculture first as inspector and later as assistant to State Entomologist. In 1910 he returned to Canada as Inspector under the Insect and Pest Act in which capacity he worked in Ontario, New Brunswick and Quebec and for a time in the Ottawa offices. He is at present Field Officer for the Division of Entomology for Nova Scotia where his attractive manner and thorough work have won for him and his work the confidence and co-operation of the farmers in general.

Clydesdale Stallion For Sale

Clyde Stallion, Flash Favorite 2nd (11269), sire and dam imported by N. S. Government, foaled June 1st, 1908. Weighs 1500 lbs., is of the heavy draught type. Sound and a sure foal getter. A well trained, prompt, and kind worker. Has been twice a prize winner at Amherst Horse Shows.

Inspection invited. Long distance 'phone.

FRED. S. BLACK, Amherst, N. S.

How Cabbage Seed is Grown.

Seed farms are always interesting. A large proportion of the cabbage seed used in the United States is grown on Long Island. In fact this industry is a very important one with the farmers of that section. As cabbage is a biennial plant two seasons are required to grow a crop of the seed. The plants are set during the latter part of July and the first of August, and are put 15 to 18 inches apart in rows 3 feet wide. By setting out at this time a small head is produced by the time cold weather comes. A large head is not desired. At the approach of winter the plants are dug or pulled up and buried about 18 inches deep in trenches for protection.

The lattet part of March or the first of April the plants are taken from the trenches and again set in the field. If the heads are hard they are split open with a knife before setting out. Throughout the spring and early summer cultivation is given and sharp ridges of soil are worked around the stalks to prevent falling over. The seed stalk develops from the small head formed during the fall and grows 3 to 4 feet high. When mature the stalks are cut and allowed to lie on the ground until dry, when they are hauled to the barn or other convenient place for threshing.

This operation is performed either by hand or by a threshing machine. The latter maethod is much quicker but breaks a good many of the seeds. The hand method is most commonly used. A large space of ground or floor is covered with sheets and the seed stalks piled on them. Between the piles barrels are placed and the threshing is done by flailing these barrels with the seed stalks. When this part of the operation is completed the pile of seed is raked over with a hand rake to remove all the hulls and other coarse material. Then the seed is dried and run through a fanning mill to remove the finer particles of foreign matter. It is then ready for sale.

JOHN RICHARDS,
Bideford, P. E. Island,

Breeder and Importer of

Clydesdale horses of the highest quality and breeding—the stud includes the noted show and breeding horse "Baron Kelvin." Every brood mare is a first prize winner at Scotch and Canadian shows. Driving horses generally on hand. Shetland ponies of the smallest type and best breeding. Polled Angus cattle of the most fashionable strains. Herd won first prize Toronto in 1906 and many other shows. Also small herd of Shorthorns from imported deep milking families.

Write Box D, Sussex, N. B.

Fertilizers for the Plum Orchard.

(Continued from page 475)

nitrogen-hunger (indicated by a sparse development of foliage and a yellowish green colour) nitrate of soda may be used as a top dressing, at the rate of 100 to 200 per acre. acre.

PHOSPHORIC ACID, POTASH AND LIME:—There is probaly no better medium for supplying these elements to orchard soils than unleached hard wood ashes. These should contain from 5 to 6 per cent. of potash, and in the neighborhood of 2 to 3 per cent. of potash, and in the neighborhood of 2 to 3 per cent. of phosphoric acid, and from 30 to 35 per cent. of lime. Not only are these constituents in a condition that renders them readily available, but in many parts of Canada they are cheaper than in any other form of commercial fertilizer. Fifty to eighty bushels per acre is the usual application.

Bone meal should contain from 3 to 4 per cent. of nitrogen, and 20 to 24 per cent. phosphoric acid. Since its plant food is only slowly liberated in the soil, it is considered a "lasting" fertilizer and one well adapted to orchard use. The application is usually about 300 lbs. per acre. Superphosphate will contain from 15 to 20 per cent. of phosphoric acid, the greater portion of which should be in a soluble (available) condition. The application is from 200 to 400 lbs. per acre.

Basic slag is another phosphatic fertilizer, and one that of late years has advanced much in favor. While not containing any water-soluble and hence immediately available phosphoric acid, it presents this element in combinations that readily yield their phosphoric acid to plant growth. Good brands contain about 14 per cent. assimilable phosphoric acid. It is alkaline due to the presence of lime and is therefore, of special value for sour and ill-drained soils and those naturally deficient in lime. It has given good returns on heavy clays and peaty loams. The application is in the neighborhood of 500 lbs. per acre. Certain experiments in England point to the desirability of furnishing part of the phosphoric acid as superphosphate and part as Basic slag, more especially for moderately heavy loams.

Potash can be obtained in the form of muriate (50 per cent. actual potash) or as Kalnit (12 per cent. actual potash); 100 to 150 lbs. of the former and 200 to 500 lbs. of the latter are the limits for ordinary application.

Voorhees, in his work on FERTILIZERS, suggests one or other of the following mixtures for orchards: (a) One part, or 100 lbs. each, of ground bone, superphosphate, and muriate of potash; and, (b) a mixture of one and a half parts, or 15 lbs. of ground bone and one part, or 100 lbs., of muriate of potash.

Soils differ so greatly as to their fertility that it is impossible to state definitely the amounts of these fertilizers that could in all cases be used with profit. From 300 to 500 lbs. of such mixtures per acre on fairly good soils would, no doubt, be ample, but on very poor soils these amounts, according to the experience of many orchardists, might be considerably increased.

LIME:—While lime is only required, by reason of excess of humus, or the refractory character of the soil, it may be applied at the rate of 1 to 2 tons per acre. A special application of lime may not be necessary in cases in which Basis Slag is used, since the fertilizer contains about 30 per cent. lime.

Comparison Proves It

You will be better pleased with Red Rose Tea---you'll praise it more and more if you ever try a package of another tea.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure — **you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. I know that my home treatment is a safe and sure cure for **Leucorrhoea** or **Whitish discharges, Ulceration, Displacement** or **Falling** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths**, also **pains in the head; back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar** to our sex.

I want to send you a **complete 10 days' treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost**, my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all woman's diseases and **makes** women well, strong, plump and robust. **Just send me your address,** and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H. 309 - - - - WINDSOR, Ont.

COULD NOT LET ANYONE TALK TO HER

SHE WAS SO NERVOUS.

Diseases of the nervous system are very common. All the organs of the body may be sound while the nervous system is all upset, on account of the troubles and worry which fall to the lot of one who has to look after the troubles incident to housekeeping, and when the nerves become unstrung the heart is also effected.

In Milburn's Heart and Nerve Pills is combined a treatment that will cure all forms of nervous disorder as well as act on the heart itself, and for this reason we would highly recommend them to all run down women.

Mrs. Wm. Smith, Terra Nova, Ont., writes:—"I wish to tell you that I have used Milburn's Heart and Nerve Pills. I was so nervous I could hardly let anyone talk to me until a neighbour told me to try your Milburn's Heart and Nerve Pills. I got three boxes, and did not have to get any more as they completely cured my nervous system."

Milburn's Heart and Nerve Pills are for sale at all dealers, or mailed direct on receipt of price, 50 cents per box, 3 boxes for $1.25.

The T. Milburn Co., Limited, Toronto, Ont.

BARRED ROCKS

Orchard Hill Farm,
Brown's Flats, N. B.

Use of Fertilization in Apple Orchards.

(Continued from page 471)

Q. A Member—How about Basic Slag as an orchard fertilizer?

A.—We have only had one year's experience with Slag. It should be a satisfactory carrier of phosphorus, but I am not recommending it especially until we get some definite evidence that it is better than our own carriers of this element. Thus far it has seened foolish to me to ship our phosphic rocks to Europe and import their Slag, both containing phosphate

Mr. Buchanan—We have it here, and it is cheap.

A.—Then perhaps it would be well for you to use it.

Q.—What is the effect of fertilizers on keeping quality?

A.—We have no definite results on that yet, being so crowded with getting these other results but I will say that in the case of the Baldwin where nitrates retarded maturity by three weeks it made it a winter apple, whereas the unfertilized Baldwin was a fall apple and would not keep so long.

Mr. Shaw—We have a feeling that where fertilized with stable manure, apples are softer.

A.—This may be true and it also is liable to cut the color. In case of some varieties also, such as the York Imperial, we cannot leave them on the tree long enought to recover the color loss.

Q.—In these orchards where you carried on these experiments, what previous treatment had they received?

A.—They had been tilled, mostly.

W. W. Pineo.—Most of us cannot raise apples here without cultivation.

A.—There is no objection to cultivation though so far as conserving water is concerned, a proper mulch treatment has been shown to be at least as good and where fertilizers also are needed it seems that greater total returns can be secured without cultivation than with it. This, however, is primarily a local question, and no method that is now satisfactory should be changed until the purposed change has been tried in a small way and definitely proved to be better.

Q.—After you apply the fertilizer to surface of soil, what then? Any tillage?

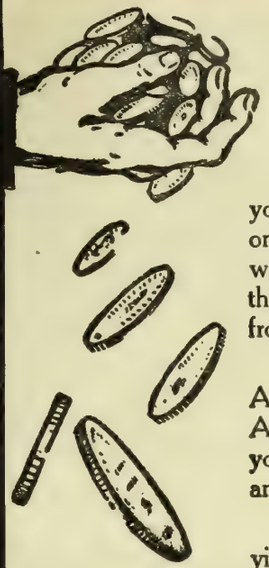
A.—You can either work it into the soil or leave it on top to be carried in by the rains. The form of tillage which does the least damage to the roots is preferable. Deep plowing is undesirable, should not be deeper than 4 inches, and a double action disc is usually preferable. By far the majority of feeding roots will be found between 3 and 12 inches deep, regardless of the cultural method unless the soil is very dry.

W. W. Pineo ploughs his orchard twice, once in the fall and once in the spring 3 ins. deep and does not think there is any better system—harrows up the 1st of July and then sows clover.

I always prefer a low headed tree. I don't see what use a tree has for more than 12 inches of trunk or 18 inches at the most. It is difficult to get this kind of tree from the nursery. The only way that we can get it is to buy a one-year-old unbranched tree and grow the head to suit ourselves. Nursery men object to selling us these one-year-old trees, but there is a growing demand for them.

If nursery men would head all trees low it would be well, then those who want high headed trees could cut off the lower branches. Nursery men will here again tell us that there is no demand for this kind of tree, but if they would use their influence to make low headed trees more popular, there soon wodld be a demand.

MONEY IN POTATOES



Don't let any of it slip through your fingers

If the average crop is good enough for you, you are going to miss the **big** profit on your potatoes. The **extra** bushels are what count. With potatoes at $1.00 a bag they are gold. Don't let them get away from you.

You should get 240 bushels to the acre. And you can if you start in early enough. Are you going to let bugs fly away with your profit? Are you going to sit down and let weeds and blight get in their work?

At the present high prices, the average yield of 120 bushels is not enough. It will net you $48.00 to the acre over and above expense and labor. But expert potato growers have learned how to double the crop. The extra 120 bushels add $80.00 per acre to the profit, making a total clear profit of $128.00 to the acre.

What these men have learned has been gathered together in a little book entitled "Money in Potatoes." This is the best practical potato book we know. It gives you a chance to learn in a few hours facts that it took many years to accumulate.

The $80.00 Coupon will entitle any bona-fide farmer to a free copy while they last. 16

Growing Summer Crops in Winter Season

(Continued from page 487)

ped out 25,000 head celery which he had in storage since last fall. Large quantities of rhubarb are also grown under the benches in the old green houses and in the cellars of his storage buildings, all of which command handsome prices at this season. Cabbage, cauliflower, parsnips, carrots and various other vegetables are handled in large quantities.

The orchard on the Gravatt farm yields from 700 to 1000 barrels apples and is increasing in value.

Mr. Gravatt purposes to put his whole energy into intensive farming under grass. He grows a succession of crops and no part of the covered area is allowed to remain idle for even a day.

At a later date we hope to show cuts of the Gravatt green houses.

From an employee Mr. Gravatt has become an employer. He has five or six hired men to assist him in his operations.

Mr. Gravatt pays personal attention to each and every detail of his work. He sees that his customers get full value for their money and that no one is sent any stuff which he would not like to receive if he were the purchaser.

He certainly is an exponent of the spirit of adages referred to at the commencement of this article and by their due observance he has made good in the land of his adoption. He does not wish to go West or anywhere else. Mr. Gravatt and his bright, hospitable, little family say "Nova Scotia is good enough for us." He could not be purchased now for one cent. We figure it would take a sum extending into the five figures to buy his holdings, and all has been accomplished in less than eight years.

Increased Value of Farm From $900.00 to $15,000.00 in Ten Years.

(Continued from page 486)

The following results speak for themselves and are very encouraging:

First trees out four years produced .... 11 barrels.
2nd year orchard produced .... 17 barrels
3rd year orchard produced .... 135 barrels.
4th year orchard produced ....600 barrels.
5th year orchard produced .... 1750 barrels.

Mr. Margeson has made good. His farm is today valued by Mr. S. B. Chute, General Manager of the United Fruit Companies of Nova Scotia than whom there is no better authority on orchard values in Canada, at $15,000.00.

Mr. Margeson's achievements are a source of inspiration to many men of his acquaintance. He is a keen observer and he has brought the influence of a good education, sound business ability, and a willing mind into his transactions and slowly but surely he has been able to bring life out of chaos and lay the foundation of of one of the best conducted commercial orchards in the land of Evangeline.

Paul Campbell, Merton, Ont., picked 65 boxes of No. 1 Snows, one box of No. 2 Snows and one box of culls off one tree. Of 1,000 barrels of apples from his orchard, 97 per cent. of them were No. 1. He has sprayed thoroughly with lime-sulphur for the last five years. So good is his fruit that he readily disposes of all of it directly to his customers by private order."—Farm and Dairy.

ONTARIO WHEAT + MANITOBA No 1 HARD

BEAVER FLOUR

YOU can make a bigger and better loaf of bread with "Beaver" Flour than with any Western Wheat Flour.

Of course, there's no comparison between Ontario fall wheat and western wheat. Bread made of Ontario flour alone is immeasureably superior to that made of western wheat in texture, fineness, whiteness and flavor.

It is true that western wheat flour makes a big loaf—but it is heavy, tough, full of holes and uninviting both in appearance and flavor. "Beaver" Flour has the delicacy of flavor—the fineness of texture—the snowy whiteness of the best Ontario fall wheat, with the strength of Manitoba wheat flour.

Because "Beaver" Flour contains both Ontario fall wheat with a little Manitoba spring wheat to increase the strength.

"Beaver" is the original blended flour—a product of science and patience—perfected after years of testing.

If you want real home-made bread with the real home-made flavor—if you want light, delicious Pastry, Cakes and Pies—use "Beaver" Flour, best for one, best for all.

Budded vs Grafted Stock.

(Continued from page 465)

ly cultivated the apples are as fine as can be grown anywhere.

There are acres and acres of suitable orchard sites in and around Port Elgin, which may be purchased at reasonable figures.

One of the greatest needs of the district is better railroad facilities. If the I. C. R. could be induced to take over the N. B. & P. E. I. railroad and put it in proper shape, it would make a big change in this part of the province.

I would suggest that you emphasize the need of a better quality of nursery stock for the Maritime Provinces and recommend one-year-old budded trees in preference to three-year-old grafted trees.

My experience in planting trees during the past year has been as follows: I ordered my trees through the New Brunswick Fruit Growers' Association. My order was filled in part with one-year-old budded trees and the remainder with three and four-year-old grafted trees. These trees were all set in the same field on uniform soil and had the same care and attention. The budded trees made a growth of from eighteen to twenty-eight inches, while the grafted trees grew only from two to six inches. Another strong point in favor of the one-year budded tree is that it is usually a straight shoot from four to six feet long, with very few, if any, branches and are full of leaf buds from the roots up. You can leave a bud wherever you want a branch to grow and rub the rest off. In this way you can form any kind of a head you wish, while with the grafted tree of three years, it is generally trimmed to a long trunk with a bunch of limbs at the top and about all you can do with it is to leave it as you get it.

I would also recommend the testing of new varieties of apples suitable to the soil and climate of New Brunswick. Our government should make tests in the illustration orchards of a winter variety called the Mammoth Black Twig. I believe it will prove a promising variety for New Brunswick orchardists to grow.

Trusting my few rambling notes may be the means of arousing at least a small share of interest in fruit growing in these parts.

W. A. Scrimgeour,
Amherst,
N. S.
and Port Elgin N. B.

A spray rig will last in proportion to the care bestowed upon it. I had one that was perfectly satisfactory and I hoped it would last for a good many years; but one of my men put the thing in winter quarters full of water and Jack Frost got in his work by bursting the tank and several other parts, completely ruining it. —W. A. Pratt.

If you are building or re-building this Spring—you need the

Compare the "BISSELL" with other disks

Thousands of Farmers have tested the "Bissell" Disk Harrow in the same field with other makes and found that the "Bissell" HAS THE GREATEST CAPACITY.

The plates are the correct shape. They cut, turn and pulverize the soil where others only scrape the ground and set it on edge.

The "Bissell" Scrapers meet the plates chisel fashion and keep the plates clean. Movable Clod Irons—an exclusive feature—keep the space between the plates clear.

The "Bissell" stays RIGHT DOWN TO ITS WORK. It won't bind, buckle or hump in the centre no matter how stiff or hard the soil may be. It is built to stand hard usage. The simple method of balancing the driver's weight removes neck weight. It is the Harrow you should know more about.

T. E. BISSELL CO., LTD., ELORA, ONT.

From Sickness to Health,---Poverty to Prosperity

By Barry I. Whitehead, Upper Queensbury, N. B.

WITH one exception the persons mentioned in the story I am about to relate are all living and at the present day are citizens of New Brunswick, and it is by their requests that I employ assumed names simply for the express purpose anonymity, the facts are all true. The hero of this story is a prosperous resident farmer of York County, New Brunswick.

A large steamer had left port at Liverpool, England, one bright day the middle of April, 1902, bound for St. John, New Brunswick.

Captain Hammond was sitting on deck a few hours later with his glass watching the receding shores of old England, when one of the mates approached him. "What's to be done, Captain?" he said. "One of the men found a stowaway hid among some old sails and rigging on the lower deck, just a boy too." "Is that so, Jake," replied the captain with a laugh, "we have a passenger like that nearly every trip, and something must be done, bring the young dog up here to me, I reckon he will wish he was somewhere else before he sees land again. I got to turn over a new leaf." "He can't move sir," replied the mate "he is that sea-sick." Alright I will go down and see him" replied the captain. "Lead the way."

In a moment the captain was beside the boy who was lying on a pile of old ropes unable to raise his head, he opened his eyes as they approached and rightly guessed that the captain stood before him; but was so dreadfully sick that he cared little if he lived or died, or if it was captain or sailor before him. Those who have experienced sea-sickness will understand the feelings of the poor boy at this moment.

"Well, you young scamp how do you like the sea?" asked Captain Hammond. "I am very sick, sir" groaned the boy. "I should think so," replied the captain. "Jake" he said turning to the mate "go bring me some brandy."

When Jake returned with the brandy he gave the boy some and after a short time he seemed a little better.

"Thank you, sir," he said as the captain gave him a second drink, "I believe I feel a little better, are you very cross because I am aboard?"

The captain could not forbear smiling at the boy's question. "Yes" he said. "I am very cross. What will your parents say to you going off in this manner; or have you been up to some mischief and trying to escape the punishment, answer me?"

The boy's eyes filled with tears. "My parents are dead" he replied, "and I have done no mischief, I want to go to Canada." "What do you intend to do in Canada?" asked the captain. "I am going to learn farming," replied the boy, "and in time buy a farm of my own," and, he continued, "my mother and two brothers died less than a year ago and my father just three weeks ago. The last night my father lived he said to me "Charlie, my boy, in a few hours you will be all alone in the world with no relatives or money, if you can ever get a chance to go to Canada, go. I have read much about it as a land of prosperity and its need for settlers and help of all kinds. You always said you were going to Canada to farm when you got older, and you will soon have no ties to keep you here. They say the climate is healthful, if you could go soon perhaps you will escape the dread disease that has taken your mother and brothers and that is soon to claim me."

"What did your relatives die with?" asked the kind captain, as he looked in pity at the frail, handsome youth. "Consumption" replied the boy. "What is your name and how old are you?" "My name is Charlie Thorpe, sir, and I am fifteen years old." "Well, my boy, I am going to have a bunk prepared for you at once you are sick and it is very cold here. Have you been well before you came aboard?" "Quite well, sir, except for a bad cough. I took care of my father and he was in bed ten weeks,and during that time I seldom had enough to eat, we were very poor, sir, and I could not get steady work, but since father died three weeks ago I have been getting a job any where I could, but in London there are a dozen boys for every job nearly, so I did not get many, and I slept anywhere night over-took me. I was afraid I would be put in the Orphans' Home, and as I had enough money to go to Liverpool,I did so and I learned yesterday that this vessel was to sail today, so last night I stole on here and hid among this rubbish. I thought perhaps after you got to sea you might let me work my passage." Captain Hammond's voice trembled as he hastily replied. "You will have the passage without the work, I guess."

So Charlie Thorpe made one true friend in Captain Hammond who immediately had a bunk prepared and had him in it in a few minutes. He was taken good care of and in three days he was able to go on deck with assistance.

As Charlie Thorpe is the hero of my story perhaps a description of his personal appearance would not be amiss as he appeared on deck for the first time one afternoon. He was rather small and thin for a boy of fifteen, very pale with large black eyes and black curly hair, his complexion now since his illness is rather ghastly, and he was very feeble when he walked. He was a manly looking boy, Captain Hammond thought, and but for his too pale face would be handsome. But as he looked at him an this particular afternoon and heard the frequent racking cough he thought he was already a victim of consumption. "Well how are you feeling, my boy" he said, as Charlie appeared on deck, "rather a better sailor?" "Yes sir" he replied. "I feel much better, but so very weak."

The captain noticed that his clothing was old and worn and going to his cabin brought him a long heavy coat which he helped him put on. "You must protect yourself from the cold, Charlie" he said, "as you are rather poorly, so you can have this coat which I advise you to put on whenever you sit on deck." "Thank you, sir, I will" he replied.

"May I ask you what you intend to do when you reach St. John?" asked Captain Hammond. "You will not be able to work for a while." "I hardly know sir, but I shall look around for work. I must do something. I only have a few cents. It is rather hard to have no money, no home, and no friends and be ill into the bargain." And the lonely boy leaned his head wearily on his hand.

"You have one friend my boy, if you will allow me to be" said Captain Hammond. "Will you let me help and advise you?"

"Thank you," returned Charlie. "I shall be glad, in deed, to have such a friend as you, you have been very, very kind to me already and I shall always be thankful to you for it. I will be very glad if you will advise me what to do. I should like to go to the country to work if I could." "Well," replied the Captain, "I have an idea in my mind and I will tell you what it is and it may suit you alright. My home is in St. John and we will reach there day after to-morrow. I will take you home with me, and in the meantime I will communicate with a cousin of mine who resides on a large farm in York County about twenty-five miles above Fredericton. He has a hard time getting help, and I am confident that he would hire you for the summer and perhaps for a year. He has one son two years older than you and a daughter a little younger, they are very nice people and you would have a chance to learn farming to your heart's content."

"Captain" said Charlie, "I can never thank you enough for your kindness, I shall feel better from this moment in knowing I have such a friend as you." And tears of gratitude shone in the boy's eyes. "Never mind," replied the captain. "We won't talk any more about it now so rest and enjoy yourself as much as you can and try and regain your health and spirits."

The remainder of the voyage was uneventful to Charlie except that he enjoyed it, and several lady and gentlemen passengers were very kind to him and often gave him fruit and wine and talked to him at times. Charlie did not know that Captain Hammond had told them his sad story and thus enlisted their kindness in his behalf.

Noble Captain Hammond, he is looked on to-day and always will be as one of Charlie Thorpe's most loved and honoured friends.

CHAPTER II.

On April 28th, 1902, the majestic steamer which carried Charlie Thorpe arrived in port at St. John and our young hero first set foot on New Brunswick soil. Captain Hammond took him home with him where he was kindly received by his wife and daughters. The following day the captain called in one of the best physicans in the city to see Charlie, who pronounced him "run down," but when he heard that his relatives had all died with consumption he looked very grave and recommended him to spend all the time possible in the open air. On learning that Captain Hammond was to get him a situation in the country he said, "you can go to the country any time, the sooner the better but you must do no hard work for six months at least." Turning to Charlie he said. "Go to the farm by all means, do a little light work and keep in the open air, sleep in a tent as soon as the weather will permit, and eat abundantly of eggs, meat, milk and fruit in season and take good care of yourself and I will have strong hopes of your complete recovery."

After the doctor had gone Charlie turned to the captain and his wife. "The doctor thinks I have consumption now doesn't he?" "Well, as you are so poorly he is afraid it might be nereditary but we must follow his advice to the letter," said the captain. "But I must work," returned Charlie. "Yes light work, but no hard work. I will write to my cousin, Robert Brown, this very day and explain your state of health, and see what he says. Would you be willing to do some light work for awhile for your board and clothes?" "Yes, sir, willingly, and perhaps I shall get better." replied Charlie, the great fear of the dread consumption being uppermost in his mind.

So Captain Hammond wrote to Mr. Brown all about Charlie, how he came to New Brunswick and his present state of health, and asked him if he could give him a home for a few weeks and in return he would do what work he was able, as he was anxious to learn farming and that the doctor had ordered an open air life for him. A reply came a few days later saying he would give Charlie a home for six months with his clothes and board, if he was able to help milk and feed pigs and calves and do such work as he could after he got well. "If so," wrote Mr. Brown "send him along next Tuesday, May

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

SAVED FROM AN OPERATION

How Mrs. Reed of Peoria, Ill., Escaped The Surgeon's Knife.

Peoria, Ill.—"I wish to let every one know what Lydia E. Pinkham's Vegetable

Compound has done for me. For two years I suffered. The doctor said I had a tumor and the only remedy was the surgeon's knife. My mother bought me Lydia E. Pinkham's Vegetable Compound, and today I am a well and healthy woman. For months I suffered from inflammation, and your Sanative Wash relieved me. I am glad to tell anyone what your medicines have done for me. You can use my testimonial in any way you wish, and I will be glad to answer letters."—Mrs. CHRISTINA REED, 105 Mound St., Peoria, Ill.

Mrs. Lynch Also Avoided Operation.

Jessup, Pa.—"After the birth of my fourth child, I had severe organic inflammation. I would have such terrible pains that it did not seem as though I could stand it. This kept up for three long months, until two doctors decided that an operation was needed.

"Then one of my friends recommended Lydia E. Pinkham's Vegetable Compound and after taking it for two months I was a well woman."—Mrs. JOSEPH A. LYNCH, Jessup, Pa.

Women who suffer from female ills should try Lydia E. Pinkham's Vegetable Compound, one of the most successful remedies the world has ever known, before submitting to a surgical operation.

Just you try it. Sold by

C. GATES SON & CO.,
MIDDLETON, N. S.

3rd, to Keswick Station, York County and I shall be there when the train arrives. If he leaves St. John on the early train he can connect with the Gibson train and will arrive at Keswick 10.45 A. M."

After reading, Captain passed the letter to Charlie who exclaimed with delight "How lucky. I shall look after that kind of work with pleasure, and just think I never even saw a farm yet, I got everything to learn. Perhaps I can drive a horse sometimes when I am better." "Yes, of course you will, but always remember to take care of yourself," replied Mrs. Hammond, who was growing very fond of the boy. The day before Charlie was to leave for the country, Captain Hammond made him a present of a nice tent, and Mrs. Hammond and daughters gave him a new suit of clothes. Charlie thanked them with tears assuring them that he would never, as long as he lived, forget their kindness, and he never has.

On the 3rd of May, Charlie Thorpe bade his kind friends adieu and started out to learn farming and regain his health. The captain bought his ticket and put him in the conductor's care and bade him write to them often.

Charlie felt rather depressed as he was carried away from his friends, but he resolutely turned his thoughts to other channels, and took note of the fine scenery he was going through, what beautiful farms, and now and then he would catch a glimpse of a large herd of cattle or a flock of sheep and lambs or perhaps some colts.

Charlie Thorpe made several resolutions that morning as he was going towards Fredericton; first, that he would take all possible care of his health; second, that he would try to please Mr. Brown and his family in all things and try to learn to farm, and last, but not least, he resolved to have a farm of his own if he regained his health. Did he regain his health and did he keep his resolutions? The following pages will tell.

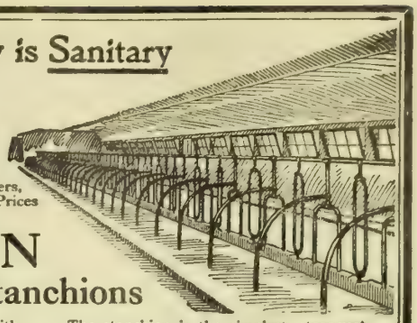
On arriving in Fredericton he took a coach and drove to the St. Mary's station as the conductor had advised him, and took the train from Keswick, a distance of ten miles. He was equally charmed with the scenery the farther up the river he went, and the time passed so quickly he was surprised when the conductor called out Keswick.

CHAPTER III

Charlie Thorpe was very kindly received by Robert Brown and his family. Mrs. Brown was a motherly, middle-aged woman who petted and fussed over him as if he had been her son. Mr. Brown was of a kind and jovial disposition. Frank, their son, was a nice, jolly fellow, and very pleased at the prospect of a companion and Jessie, who was about Charlie's age, was a pretty, rosy-cheeked girl.

For several days after his arrival, they would not let Charlie do anything as he was thought very ill, though he insisted he only looked that way in comparison to Frank who was so rugged. Never-the-less, Charlie presented the tent that his kind friend in St. John had given him, and Mr. Brown consulted Dr. Graham, who chanced along, as to the best place to erect it. He proposed that it should be arranged to enclose a portion of the front veranda, leaving three openings or windows for good ventilation. This, said he, will be much better for several weeks or until the ground is thoroughly dry and the warm summer weather sets in. Mr. Brown told Dr. Graham Charlie's story as Charlie had told it to him from the time of the death of his parents until the

The Barn of To-day is Sanitary



IT is clean, airy and comfortable. Under modern conditions cows give more milk and are more profitable. The best barns are equipped with Louden Stalls, Stanchions, Litter and Feed Carriers, which cost no more than poorer makes. Prices within reach of everyone.

LOUDEN Cow Stalls and Stanchions

are made of light, strong tubular steel with malleable iron fittings. The stalls, bull pens, and calf pens allow the animals plenty of air and light, and promote cleanly conditions.

The stanchion is the simplest, strongest and most comfortable cow stanchion possible. Has positive latch, easily and quickly operated but perfectly secure.

present time. "Do you think there is a chance for him, Doctor?" he asked. "That is hard to say" replied Doctor Graham. "The boy seems very weak just now, and according to your account there is a possibility that he has inherited consumption but I don't say that it is so, and fresh air and good food has wrought some most wonderful cures."

So a part of Mr. Brown's veranda was enclosed as Dr. Graham had proposed and Charlie slept there and took his meals on the other part of the veranda. Many were the dainty and wholesome dishes that good Mrs. Brown and Jessie prepared to tempt the fickle appetite of the invalid. After a few days Charlie began to feed pigs, calves, poultry, ect., and to help milk, but he was very careful not to tire himself too much. He felt he owed it to his kind friends as well as himself to take every precaution. He was much interested in the farm stock and work, which all helped to keep his mind from brooding on his health. Often he had drives with Frank or Mr. Brown, and occasionally he and Jessie would be sent on some errand with a quiet driving horse, when the men were busy in the field.

Gradually his appetite began to improve and his strength to return and he did more work accordingly. He was delighted with the change for the better as were his friends. After he had been three months with Mr. Brown he wrote for the third time to Mrs. Hammond at St. John, to let them know regarding his health.

The following is a copy of the letter he wrote and will describe his condition in his own words:

Dear Mrs. Hammond,—

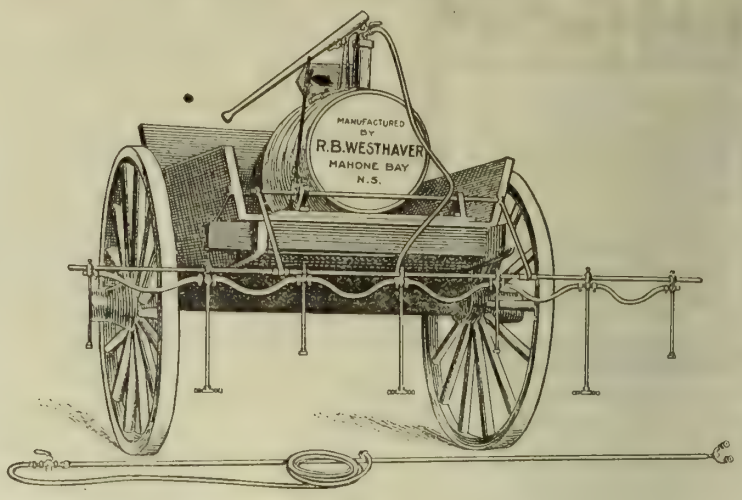
As I promised to let you know again this month how I was getting along, I will write you this evening. I feel just O. K. now and am gaining every day in strength. The air is delightful and I got a tremendous appetite and still take my meals here on the veranda where I am now writing, and continue to sleep in my shack, as Frank calls it, and the windows open day and night, unless it is raining in. I have been helping Mr. Brown and Frank at hoeing this week in addition to my own chores, but they will only let me hoe an hour each day as you know it is pretty hard work, if we forget the time Mrs. Brown does not and comes out to remind me; they take great care of me. I often think was a boy ever as fortunate as myself to fall in with such kind friends, as you people and Mr. Brown's here. If I keep improving I am going to rake the hay for Mr. Brown next month when they begin haying. Jessie says she raked a lot of it last year with the horse rake you know, and so I am sure I can. Mr. Brown says if I do he is going to begin paying me wages, but I want to work all the year for nothing and then will never repay them for their kindness to me. After the hay is cut in the orchard we are going to put up my tent out there Frank says we will cut it there first.

When I came here I could hardly carry a pail of milk, and now I carry a pail in each hand. Mr. Brown said to me just this morning, "Charlie you are a trump to raise calves, they are growing like weeds." I will write and tell you all about my work sometime. I wish you could see the colts, two bays, and their names are Bob and Bess.

I suppose the captain has not returned from his last voyage, he will be glad to hear that I am getting better. It is to him I owe my good luck if not my life. Give him my kindest regards when you write him again, please. Also remember me to

THE ONLY "PERFECT" SPRAYERS

"BUILT FOR BUSINESS"



Perfect in design
Easily operated
Requires no frequent repairs
Fully guaranteed
Entirely satisfactory as a
Crop saver

Try our Four Row Potato Sprayer

The intermediate nozzles for spraying the sides of the vines make it far superior to any row sprayer with surface nozzles only. They are instantly adjustable for height and width of row; can also be folded up for passing through a gate. Horse power outfits for either one horse or two can be furnished on short notice.

the girls. With best respects for your self,

Ever your friend,
Charlie Thorpe.

P. S. I forgot to tell you that Mr. Brown gave me a nice Sunday suit two weeks ago, and Mrs. Brown made me a suit to work in this week. Please write to me soon.

C. T.

Yes, Charlie Thorpe was now on the road to recovery. He began to help Mr. Brown and Frank in the fields, after doing his own work, raking hay, helping with the harvesting of the grain, potatoes, apples, etc. As he stated in his letter to Mrs. Hammond the Browns were very careful of him, not allowing him to overexert himself in any way, and they were almost as happy in the improvement of his health and appearance as he was himself. "Charlie is going to make a great worker, Frank," remarked Mr. Brown to his son one afternoon after they had sent Charlie away from the harvest field to take a couple of hours rest. "He is a smart turned fellow and learns to do everything so quickly, and is interested in everythivg about the farm, from the poultry to the horses. I don't believe he would take a minutes rest now-a-days if we did not urge him to." "Yes, he is smart," replied Frank, "and is getting real strong too, the open-air life is certainly curing him for he told me the other day that he has not taken a drop of medicine for two months." "He is almost an expert at raising calves and pigs," said Mr. Brown, "he always feeds them right on time every feed, and I believe it is the proper way for they are the best ones we have ever raised for their age." "Yes, yes, I guess that is the right way alright," answered Frank, all the farm papers preach that up and Charlie is always reading them, he told me one day that between you and the farm papers he expected to learn mixed farming in a short time." Mr. Brown laughed heartily. "We will do the best we can for him," he said. "He is awfully fond of the colts," remarked Frank, "and can drive them as well as I can, he says if you will get another plow, father, that he will help me do the fall plowing with them. I think it would be a good plan, don't you father? A little work would be good for them, and we must get a good lot plowed if possible.

"Yes, certainly," answered his father, "a little work like that will help us and be better for the colts. I will get a light plow when I go to Fredericton next Saturday." "Has he told you he is thinking of going in the woods the middle of November?" asked Frank. "No," said Mr. Brown in surprise, "what can he do in the woods?" He said he was talking to Mr. Woodworth, the day he drove those men down to the station. You know Woodworth is going to lumber in Keswick and he wanted Charlie to go and cookee for him and offered him twelve dollars a month. He said he told him that he would let him know for sure after he had talked to you about it, and I was wondering if he had," said Frank. "No he has not yet," replied Mr. Brown "and we must not let him go in the woods this winter, he is too willing and has not yet fully regained his health. If I should buy that block of lumber land above here that we cruised last week, we must have a boy to stay here and take care of things for us, if we try to get any lumber. Of course, we can be home nights, but would have no time to look after the stock, and that is the kind of a job Charlie should have this winter." "That's true" replied Frank, "I didn't think you would want him to go, and he will do as you say, for he said so."

Eastlake Metallic Shingles

Economy

25% CHEAPER TO LAY "EASTLAKE" METALLIC SHINGLES are economical not only on account of their service and long life, but in many other ways.

"EASTLAKE" METALLIC SHINGLES can be laid twenty-five per cent. cheaper than any other shingles on the market.

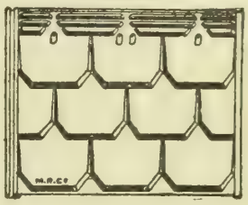
NO LEAKAGE Due to the special construction of "EASTLAKE" METALLIC SHINGLES it is impossible for water, snow or sleet to back-wash or seep through. This prevents rotting of the timbers underneath, and contents of building are never spoiled.

CAN BE BENT OVER HIP ROOF "EASTLAKE" METALLIC SHINGLES can be bent over the hip of the roof instead of having to be cut off and half the shingle wasted as with many others. This not only saves material, but saves a break in the roof, preventing a possible opening for leakage and damage.

LIGHTNING PROTECTION "EASTLAKE" METALLIC SHINGLE Roofs cost less than wooden shingle roofs equipped with lightning rods. With an "EASTLAKE" roof you do not need lightning rods, as they not only act as a lightning conductor, but are lightningproof and fireproof.

INVESTIGATE Before roofing your buildings, investigate carefully all kinds of roofing, including "EASTLAKE." The more closely you investigate, the stronger you will be in favor of "EASTLAKE" METALLIC SHINGLES

EASTLAKE METALLIC SHINGLE



If you want the best you will use "EASTLAKE."

LEA & CLARK, VICTORIA, P. E. I.

Nothing more was said about the matter for three weeks or more. Charlie was very much taken up with plowing. Mr. Brown had got the new plow two weeks before and though the colts were broken, they were very soft when put to heavy work, being only two years old the spring before. Charlie soon found that they sweated very easily and began to get tired after a couple of hours work, so he only plowed two hours in the fore-noon and two in the afternoon, this gave him plenty of time to do his other work, though he often felt very tired at night, he never acknowledged it.

Charlie enjoyed himself very much these days being of a lively disposition he was the life of the Brown family and many were the games he, Frank and Jessie enjoyed, and many an evening was spent in singing, all of them having splendid voices and Jessie played the organ very nicely. Often tney would be invited by some of the young people of the neighborhokd to a small party, and occasionally Jessie would invite them all in, and the long autumn evenings passed very pleasantly. There had been two picnics early in the fall and Charlie had then got acquainted with nearly all the younger people with whom he was a general favorite. They attended the Baptist church at Macnaquac or Queensbury, the Browns being members of the church at the latter place. Charlie had been brought up a Methodist. Thus several months passed happily away, especially to our hero.

CHAPTER IV.

"What are you thinking of my boy?" asked Mrs. Brown, as Charlie was sitting in a preoccupied mood one evening before the fire. "You look as solemn as a judge." "Of my past life," replied the boy, "I can't help thinking that if my father and mother had come out here to Canada a few years ago, that they might have been living now. Their last illness began just as mine did, a bad cough and failing strength. Had I not left England when I did, I should have been dead before this. They used to read to me about Canada and the many chances for poor people to better themselves out here. And we used to talk about coming out and buying a farm as soon as father could save up the money. Then little Willie died, and mother in less than a year after, then father's health began to fail and before many months he died, all of the dreadful consumption. Oh, why did they have to stay there and die in poverty and leave me alone in the world." And poor Charlie laid his head on the window sill and sobbed aloud. Mrs. Brown and Jessie shed tears of sympathy, and Mr. Brown and Frank were much affected. "It is God's will my dear boy," said Mrs. Brown, wiping her eyes. "Yes," said Mr. Brown "It was God's will or they would not have died. I trust they were prepared." "They were," answered Charlie. "They were both sincere christians and brought me up to trust in God." "Then," said Mrs. Brown softly,, "if you continue faithful you will all be united by and by." "Come Jessie," exclaimed Mr. Brown, "Give us some music to cheer Charlie; a cloud on his sunny face is like an eclipse of the sun." "Just a moment please," said Charlie. "I should like to have a monument erected to their memory with the first money I earn, do you think I could, Mr. Brown?" "Yes, certainly you can," Mr. Brown replied. "We will get Captain Hammond to do it for you on one of his

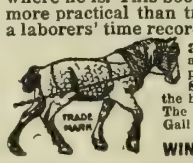
FREE-FARM ACCOUNT BOOK

Bickmore's Farm Account Book will be sent free to any farmer who will tell us who and where he is. This book is arranged to keep all accounts in simple form—more simple and certainly more practical than trying to remember them; shows what to charge against crop production; has a laborers' time record; and section for personal accounts. **64 pages, for ink or pencil.** Not a cheap affair. Its quality is in keeping with **BICKMORE'S** Gall Cure, a soothing, healing salve, the old-time reliable horse remedy. Horses are now too valuable and too high priced to take chances of losing their services. **Bickmore's** Gall Cure heals and cures **Harness and Saddle Galls; Rope Burn, Cuts, Scratches, Grease Heel, etc.** You don't have to lay the horse off. **Bickmore's cures while the horse works.** Great thing for sore teats in cows. The work-horse trade mark on every box. None genuine without it. Be sure to ask for **Bickmore's** Gall Cure when you go to buy and do not take a substitute. Farm Account Book is ready. Send today.



WINGATE CHEMICAL CO., Canadian Distr's, 8100 Notre Dame St. W., Montreal, Can.

In-Foal Mares INSURANCE

OF ALL the losses owners are liable to, none can be **less prevented or modified** in any manner whatsoever **than loss by foaling.** Notwithstanding the best care and attention, although a mare **may have foaled** many times successfully, she is always a cause of worry and anxiety to the owner through the fear of **losing by death** the often very **high cash value of the Beast,** not to mention service fee, care and expenses incurred for no avail. **Why risk such loss** when a payment of a few dollars in premiums would **cover you** should it happen. Reduce the amount **of the RISK** by insuring, only risking thereby the **loss of the Premium** if the mare foals allright. We issue 30 days, 6 months and 12 months policies with or without cover on foal.

Write for address of nearest agent. **All kinds of live stock insurance transacted.**

THE GENERAL ANIMALS INSURANCE CO. OF CANADA, Head Office: 71a St. James St., Montreal, Que.

trips to the old country." "That is right my dear boy," said Mrs. Brown "and is very thoughtful in you and will be a nice tribute of respect ta their memory." "Come Jessie," said her father, "we are waiting for some music."

Noble Charlie Thorpe! No wonder the Browns as well as all his friends loved him as they saw the many noble traits in his beautiful character.

"Mr. Brown," exclaimed Charlie at breakfast the following morning, "I saw Mr. Woodworth again yesterday. You know he is the man who is putting a crew in the woods on the head of Keswich and he will give me twelve dollars a month to go cookee for them, he says it will be an easy job for me, just cutting wood, carrying water and washing dishes and work like that. I am well now and anxious to get to earning money for myself, you know, I want to buy a farm just as soon as I can. You have all been so kind to me, that Iwould not hire until I had consulted you. Are you willing for me to go?"

"I am glad you are willing to be advised by me, Charlie," said Mr. Brown, "and I want to see you get along as fast as possible; but I am not willing for you to hire out this winter,you are not yet equal to the hard work you would have to do for a large crew as cookee and I am not much in favor of this Mr. Woodwoth anyway,they say he is a hard man to work for or give him that name. So I hope you will stay with us this winter, and I think you will be as far ahead. What do you say?"

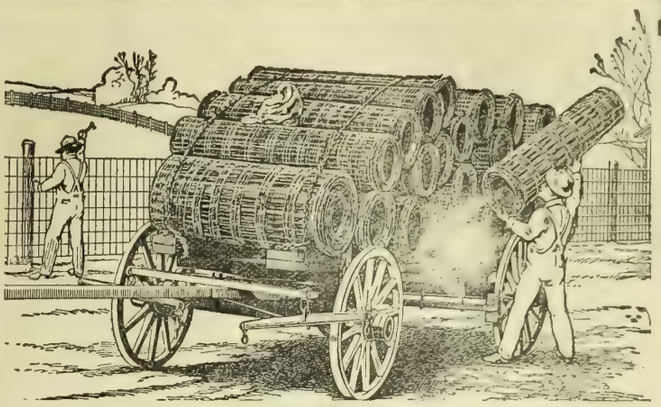
A shade of disappointment passed over the boy's face, but he replied: "Alright sir, I will stay if you think it best."

"That's right, Charlie," said Mrs. Brown, "how would we ever get along without you. I could never consent to have you go and leave us all for awhile at least." "And I could not get along without my youngest brother," exclaimed Jessie with a happy laugh. "Nor I either" said Frank. "Well" said Charlie with a laugh, "I am glad you are not all anxious to be rid of me, and I assure you it will be like leaving home when I do go, but you know I can't always stay here, I must get to earning money as soon as I can." "No you must always stay here for we can't farm without you," said Jessie.

A happy look came into Charlie's face as he looked at the beautiful girl just budding into womanhood. "I wish I always could," he replied with a blush. And none of the Brown family knew how devotedly he loved the only daughter.

"Did you tell Charlie that we had bought the lumber land, father?" asked Frank. "No I didn't," Mr. Brown answered, and turning to Charlie he added, "I bought that lumber land that Frank and I were looking over a short time ago, and we are going to get what lumber we can this wfnter. We can stay home here nights, but we want you to look after the stock for us, drive Jessie to school in stormy weather with the colts, you know they will have to be exercised, as I will not work them at yarding. I will give you five dollars a month and your clothes, of course. Then after we start hauling, will want you to drive them and help us haul a little and I will begin paying you twelve dollars a month and when farming begins will pay you sixteen dollars until another winter, and we can then make further arrangements. You are young and must not go into the hard work too quickly. What do you say to my plan?" "Say," exclaimed Charlie "I just can't say anything I am so pleased. I have been feeling down-hearted at the thoughts of leaving you, and the colts too," he added with a laugh. "I think a

I H C Quality Shows in Service



WE could sell wagons for less money, but we don't care to sell that kind of wagon. We want your second order, and your third, and every order you give for a wagon. We can't be sure of getting those orders unless the first wagon you buy from us proves so satisfactory that you would not think of going anywhere else for the second. We have to tell you how good our wagons are to get your first order. After that, we expect the wagon itself to do the selling. I H C wagons

Petrolia Chatham

are made of selected, high-grade material throughout. Come with us to the works where these wagons are built, and see the tremendous sheds where the lumber is air-dried—seasoned out of doors—for three years or more before it is used. Do you know the difference between air-dried and kiln-dried wood? One process takes years of time, and leaves the fibres of the wood filled with and cemented together by the natural resinous residue of the sap. The other requires only a few days' time, drives out all the sap, resin and all, and leaves the wood brittle and weak. Air-drying produces elastic lumber, wagon parts that bend and give under loads and strains, but that come back to their original position when the strain is removed. Try for yourself some day the difference in breaking strain between an I H C wagon axle and a piece of kiln-dried wood a third larger. Then you will know why we can hardly keep up with orders.

The I H C local agent knows which wagon is best suited to your work, and will give you catalogues and full information about the wagon he sells. See him, or, if you prefer, write

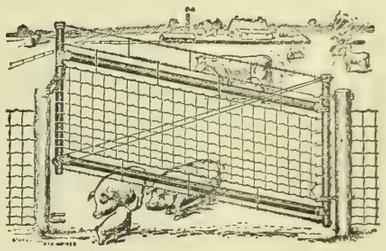
I GUARANTEE every Clay Gate to be free from defects in material or workmanship. I will replace free any parts, or the entire gate, giving out for such reasons.

H. RALPH STEELE
Manager.

Canada's Best Stockmen Buy This Gate ---

ASK any prominent stockman in Eastern Canada which is the best Farm Gate made, and it's almost certain that he will reply "The Clay Gate." The chances are that he has "Clay" Gates on his own farm, and so *knows from experience* how good they are.



Clay Steel Farm Gates

are liked by every farmer who has used them because they (1) positively keep back breechy cattle; (2) raise (as shown) to let small stock through, yet keep back large stock. (3) won't sag, bend, break, burn, blow down or rot; (4) last a life time; (5) are positively and fully guaranteed; (6) solve every Gate problem and every Gate worry.

CLAY GATES are made of tubular steel of large diameter (far stronger than gas pipe or tee or angle iron) and heavy wire mesh fabric. Five men can stand on a Clay Gate without injury to the "hang" of the gate or to the gate itself.

Clay Gates are made in a great variety of sizes—a gate for every purpose. Send today for illustrated Price List. Read our guarantee and the terms of our free trial offer.

60 Days' Free Trial

One or a dozen Clay Gates sent without expense or obligation for 60 days' free trial, in order that you may try them before buying them. 30,000 Clay Gates sold in 1912.

Don't be surprised if you have an attack of rheumatism this spring. Just rub the affected parts freely with Chamberlain's Liniment and it will soon disappear. Sold by all dealers.

lot of them." "I have nearly two miles to walk to school, and I don't care if it is stormy every day, for I will make you take me to school and come after me at night," said Jessie with a laugh. They all laughed heartily at that, and Charlie looked as though that part of his winter work would be a pleasure, and the matter was satisfactorily settled for all.

During the following week Frank and his father went to work yarding lumber on the recently purchased land. They engaged a Frenchman to help them. They went at an early hour every morning taking their dinners and not returning until after dark. Charlie was kept busy attending to the stock and work in general around the place. He had to feed eighteen steers besides the other stock. The steers were to be sold in March for spring beef. He generally had a couple or three hours in the afternoon, and he went to the woods to cut fire wood, occasionally taking the colts out to yard it. He, Mrs. Brown and Jessie kept it a secret from Mr. Brown and Frank, as they expected to take a week just after Christmas to get up the years wood for sawing. So with all his chores and cutting wood when he could Charlie was as busy as any of them, Mrs. Brown insisting that he was working too hard. Often he drove Jessie to school or went for her in the evening. These drives were a source of pleasure to both and strengthened the bond of love between them.

Christmas day dawned clear and bright and the roads were in excellent condition several inches of snow having fallen a few days before. Charlie received a present from each of the Brown family, and also gave each of them a remembrance. He also received a box of nicely bound books from Captain and Mrs. Hammond, St. John. A concert was held in Keswick Ridge Christmas night which they all attended, and enjoyed the programme very much. So Charlie's first Christmas in Canada passed very pleasantly.

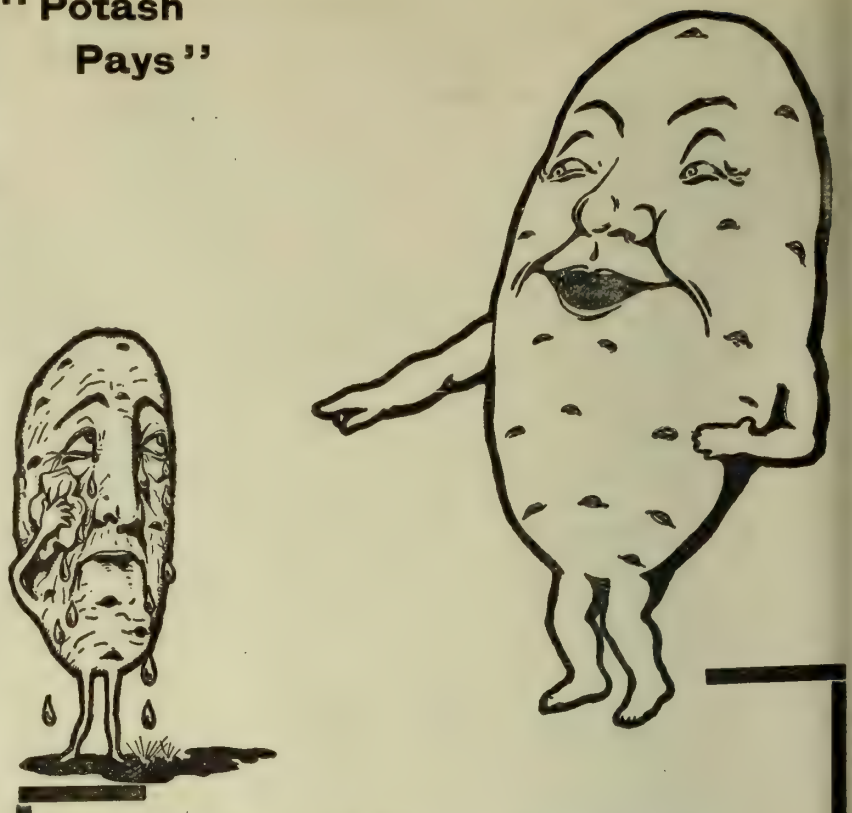
After Christmas Mr. Brown proposed they, (he, Frank, Charlie and the Frenchman) go out to cutting and hauling wood before resuming their lumbering operations, then Charlie told them the wood was all cut and yarded ready to haul, and begged them to go on with their lumbering and let him haul it with the colts, as it was small wood. Mr. Brown and Frank were delighted and very much surprised. They wanted to get their logs all yarded before the snow got too deep. "Why, when did you ever do it, Charlie," asked Frank. "Oh, a little every day," said Charlie "But you must have worked very hard to do it," said Mr. Brown. "No, not very" Charlie replied, "you forget that I have been at it nearly two months, and it is just yarded up a few loads in each place." "But perhaps you have not enough," said Frank. "Well, perhaps not," said Charlie laughing. "But let me haul what I got, and if it isn't enough I will get some more, you can be the judge."

"That's good enough my Englishman," laughed Mr. Brown, "you're a hustler. The new sleds I ordered are done so you can go to the shop and get them and haul away; but you are only to haul two loads a day, which is enough for you to do besides your other work. It will forward us with our work at least a week. Be careful the colts don't get away from you, Charlie." "I'll be careful, sir," he replied.

CHAPTER V

So the winter passed profitably and pleasantly to Robert Brown and his family and Charlie Thorpe. In fact,

"Potash Pays"



The Wail of the Starved Potato

Look at that poor, shriveled-up, good-for-nothing potato.

He is wailing because he is starved to death, and the man that grew him is wailing because he is not making the money he should out of his farm.

What is the reason? Simply because this potato IS starved. Look at Mr. Potash-Raised Potato. See how jolly and fat he is! He and hundreds of his fellows are growing fat and clean and shapely to bring his grower a good profit, and all because of POTASH. The poor, skinny potato is starved to death because his grower uses a low-grade fertilizer. This grower does not understand that every crop, say of 300 bushels of potatoes, eats from the soil approximately 60 lbs. Nitrogen, 40 lbs. Phosphoric Acid and 105 lbs. of POTASH. Note that this is 3 times as much POTASH as Phosphoric Acid.

The low-grade fertilizer contains but 2 per cent. POTASH and 6 to 8 per cent. Phosphoric Acid. Surely this is not three times as much POTASH. Any agricultural expert in the country will tell you that it is far better to use a 10 per cent. POTASH fertilizer.

This Applies to All Crops in Canada

It makes no difference what crops you raise, you'll find the ordinary fertilizer does not contain the amount of POTASH necessary to secure the largest possible crops from your farm lands.

Here is what you, Mr. Farmer, should do, if you wish to make more money from your crops.

When buying fertilizers insist that your dealer give you a 10 per cent. POTASH fertilizer. If he has not got it, and you have to use a low-grade fertilizer, use enough POTASH to increase the amount to 10 per cent. of POTASH. Our Agricultural experts will tell you just how to do this free. It is simply, easily and quickly done and will bring you many, many times the first cost in a larger harvest. Ask the Agricultural Department at Ottawa if this is not so. Or, if you so desire, you can mix your own fertilizer at your own home. Our experts will tell you how, free.

You can buy POTASH from your dealer. If your dealer has not got it, give us his name and we will sell to you direct, as we have POTASH ready for immediate delivery, stored in storehouses in Montreal, St. John, N. B., and Toronto. Write today for free booklet and prices.

Don't starve your crops. Feed them and they will feed you and your pocketbook. "POTASH PAYS." Write us to-day for free booklets.

German Kali Works, Inc.,
Temple Building, Toronto

Charlie was as much a member of the family as any one of them, and I verily believe he was regarded by Mr. and Mrs. Brown with as much affection as if he was their own son, and by Frank and Jessie as if he was their own brother. And Charlie loved them all. He always consulted Mr. and Mrs. Brown in all matters of importance as if they were indeed his parents. He was ever ready and on the watch to help them and do the many little acts of kindness that a child can always do for a parent. He looked on Frank as a brother and they never quarrelled. They enjoyed working together, Frank always giving Charlie the lightest part as to a younger brother. And Charlie regarded Jessie as a much loved sister. He loved her more than he realized for years, it was her presence he always sought, and her merry voice or laughter he missed if she was away. Often he paused in his work to listen to her singing or her merry laugh, as she went about her work. And how did Jessie regard Charlie? She loved him as she did Frank if not more.

When Charlie had been with them a year Mrs. Brown proposed that he should go to St. John and visit Captain Hammond and his family before the rush of spring work came on. Charlie liked the idea, as he had had a letter from Mrs. Hammond two days before saying the Captain would arrive home that day and was to remain a week. "But can I leave," he said. "There are so many chores to do and no person knows as well as I how to do them since I have been doing them so long." Mr. Brown "Poor boy," he said "you're awfully tied but we will try and manage them for a few days, and send you off for a vacation." "I wish Frank could go," he said, "he needs a vacation more than I do." "Father," exclaimed Mrs. Brown, "can't they both go for a few days. Jessie and I will help you with the work?" "Just the plan if he wants to go," exclaimed her husband, "they both need a vacation. Would you like to go Frank," turning to his son. "Yes sir, I should very much," he replied. "It would be fine to go together."

So preparations were made at once and the next morning the boys set off in great glee on the trip, Mr. Brown taking them to Keswick Station. The day being Tuesday they were to return on Saturday.

"You may like city life so well that you may give up the idea of farming" Mr. Brown remarked to Charlie on their way to the station. "No danger of that," laughed Charlie. "I would not go at all only I feel it my duty to go and see the captain. City life may be alright, but it has no attractions for me. I wish I was on my way back instead of going." This made Mr. Brown and Frank both laugh, and Mr. Brown said, "I hope you don't get home-sick."

On reaching St. John they took a car for Captain Hammond's. Frank wanted to go to an hotel, but Charlie insisted that he should go with him to see the Hammonds first, then they would both go to the hotel and put up, so Frank agreed. Charlie remembered the house and the servant who answered their ring told them Captain Hammond was at home and showed them into the drawing room.

Presently Captain came in. Charlie knew the kindly face at once. "Good afternoon," said the captain, "you wished to see me?" "I do" replied Charlie smiling. "I guess you don't remember me, Captain Hammond." "Well I can't recall you, no," he replied, "though like enough I have met you, I see so many strange faces, you know." "I was here with you several days just about a year ago," Charlie answered. "Then you got me a chance in the country for my health, and to learn farming."

The Basis of Oliver Success

THERE is one point about Oliver plows which gives them peculiar value in the plowing of Eastern Canadian fields. Each type of Oliver plow is manufactured for a certain section of the country, and can be depended upon to do good work under the conditions obtaining in that section. Before offering a type of plow for sale in any locality, Oliver plow manufacturers always send their expert plow designers to the place where the plows are to be used. These men study the conditions of climate and soil, learn the likes and dislikes of the people who are to use the plows, and when they return to the factory, they are able to superintend the manufacture of a plow which meets all the required conditions in the place where it is to be used.

Oliver Plows for Eastern Canada

The group of Oliver plows built for Eastern Canada includes walking plows of the famous Oliver No. 40 series, sulky plows, gang plows, and walking gang plows. Each of these is built for a certain purpose, and is the best plow obtainable for that particular purpose.

Back of the whole group is the fifty-seven years of successful plow experience of the Oliver Plow Works. This experience eliminates everything in the way of chance. You do not have to experiment with Oliver plows. Go to the I H C local agent and tell him what kind of plowing you have to do, and he will show you a plow built to do that kind of work and do it in the best possible manner. You can get catalogues and full information of the entire Oliver line from him, or, if you prefer, write the nearest branch house.

Concrete is the best building material

A BROAD statement—Yet literally true. The aim of man from the beginning has been to make his building materials as nearly like natural stone as possible. The great labor required to quarry stone led him to seek various manufactured substitutes. The only reason he ever used wood was that it was easiest to get and most convenient to use.

Wood is no longer easy to get. Like most building material, its cost is increasing at an alarming rate.

The cost of concrete is decreasing. So, from the standpoint of either service or economy, Concrete is the best building material.

Canada's farmers are using more concrete, in proportion to their numbers, than the farmers of any other country. Why?

Because they are being supplied with

Canada Cement—

a cement of the highest possible quality, which insures the success of their concrete work.

The secret of concrete's popularity in Canada lies in the fact that while we have been advertising the use of concrete, we have also been producing, by scientific methods, a cement so uniformly high in quality that the concrete made with it gives the complete satisfaction our advertisements promised.

Concrete would not have been in such universal use today, had an inferior grade of cement been supplied. Insist upon getting Canada Cement. It is your best assurance of thoroughly satisfactory results from your concrete work. There is a Canada Cement dealer in your neighborhood.

Without this label it is not "Canada" Cement.

Write for our Free 160-page book "What The Farmer Can Do With Concrete" —No farmer can afford to be without a copy.

"What" exclaimed the captain, "is that so, you are never Charlie Thorpe?" "Yes sir, that's my name" replied Charlie laughing, "and this is Frank Brown." "Well, well!" cried the good-natured captain as he shook hands. "I should never have known you, never, why you are a stout healthy looking farmer." Charlie flushed with pleasure. Of all callings he regarded farming as the highest and looked eagerly forward to the time when he would be one indeed.

"And this is cousin Robert's only son?" he said, shaking hands kindly with Frank. "Well, hardly," laughed Frank. "He calls Charlie his son too." "He is fortunate to have two sons, I haven't any," said the captain smiling.

After a few enquiries about Mr. and Mrs. Brown, he brought his wife and daughters in and introduced them. Many were the exclamations of astonisnment from the ladies on regarding Charlie's changed appearance. "Why!" exclaimed Mrs. Hammond, "you could scarcely walk when you started for up river a year ago. I was afraid to have you go alone."

"Had I been a month later, I am afraid I should have been done for" replied Charlie.

"To what do you owe your recovery?" asked the captain, "do you think." "First, to your kindness in befriending a poor, homeless, sick boy; then to the kindness of Mr. and Mrs. Brown and family, the wholesome food, and last, but not least, to the pure, bracing New Brunswick air which I inhaled day and night. I slept in my tent nights, took an afternoon nap and ate my meals on the veranda for six months. Even all winter after I began sleeping indoors, I always kept my windows open as much as the weather would permit. I was ill just as my parents and brothers were and they died of consumption, but I believe that I have been completely cured. My only regret is that my parents could not have reached here years ago, they might have been living now," said Charlie with tears in his eyes. "Most wonderful!" exclaimed Captain Hammond. "The doctor we called in to see you the day after your arrival told me privately that you were going into a decline. "If he stays in the open air and has good care, there is one chance in one hundred for him" were the doctor's words to me. The cure is certainly a remarkable one."

"Thanks to my good friends," replied Charlie. Frank told them of the work he had done. "Why," he continued, "Father says that boy's a hustler, he can do any work about the farm, and knows more now about raising stock than I do." They all laughed and the captain said: "Well done, my boy, you have conquered an almost incurable disease and learned farming in a year."

After conversing a short time on other topics the boys arose to go

"How long do you stay in St. John," asked Mrs. Hammond. "Until Saturday morning," replied Frank. "Well you are going to stop with us are you not?" she asked. "Why, of course, they are," said the captain. "But sir" replied Charlie, "we intended calling on you and then going to an hotel, we were afraid you might go away before we could see you." "No, I sail again next Thursday and you are to stay with us while in St. John. Where are your grips?" "We only brought one between us," laughed Frank, "and it is here in the hall." "Very well, I will show you your room" he said.

The boys stayed with the Hammonds who did their best to make their visit a pleasant one. Charlie immediately told Captain Hammond of his wish to buy a monument and send it to England by him, if he would be kind enough to take it, and have it erected at the graves of his

HOW TO CONQUER RHEUMATISM AT YOUR OWN HOME

If you or any of your friends suffer from rheumatism, kidney disorders or excess of uric acid, causing lameness, backache, muscular pains; stiff, painful, swollen joints, pain in the limbs and feet; dimness of sight, itching skin or frequent neuralgic pains, I invite you to send for a generous Free Trial Treatment of my well-known, reliable Chronicure, with references and full particulars by mail. (This is no C. O. D. scheme.) No matter how many may have failed in your case, let me prove to you, free of cost, that rheumatism can be conquered. Chronicure succeeds where all else fails. Chronicure cleanses the blood and removes the cause. Also for a weakened, run-down condition of the system, you will find Chronicure a most satisfactory general tonic that makes you feel that life is worth living. Please tell your friends of this liberal offer, and send today for large free package, to MRS. M. SUMMERS, Box B. 309—Windsor, Ont.

For rheumatism you will find nothing better than Chamberlain's Liniment. Try it and see how quickly it gives relief. For sale by all dealers.

parents and brothers, for him. "Certainly my boy" replied the captain. "I go direct to Liverpool this voyage and will have a couple of days to go up to London and have it done." "Thank you very much" returned Charlie. "The caretaker of the cemetery is an old man whose name is Ezra Cooper. If it is the same one he was a friend of father's and was very kind to us. He will show you where the graves are, and he is paid to keep them all in order. What do you think it will cost, Captain, to have it erected?" "Not very much," replied the captain. "I will attend to it." "I will give you ten dollars and if that is not enough, will make it alright on your return," said Charlie. "No, it won't cost that much and we don't know the amount and I won't take a cent any way" replied the captain. "You buy the monument and I will do the rest." "Thank you sir. I am troubling you too much I am afraid." "Not at all my boy. Won't you go to England with me this trip and do it yourself? I will give you a free trip" said the captain. "No thank you, I shall never see England again if you will do this errand for me and," he continued with a laugh "I had a free trip out."

The next morning the boys went to the marble works and Charlie selected a heavy marble slab and had the name and ages of his parents and brothers engraved, and a short text. He called again before leaving the city and found the monument all finished and packed for shipping. This cost him forty dollars. They all visited Rockwood Park one afternoon, Captain and Mrs. Hammond and the Misses Hammond, Frank and Charlie. Then Captain Hammond took them to the harbour where his vessel, among others, was in port. They went on board the Captain's ship and Charlie showed Frank the very place he had concealed himself on the lower deck in order to get to New Brunswick. Frank especially was much interested in the scenes of the city which was all new to him.

One afternoon while the captain was attending to some business, the young ladies and the boys took the street car and went all over the city.

"So you are going to cast your lot with the farmers are you Charlie?" asked Mrs. Hammond the last evening of their visit. "By all means," answered Charlie. "Don't you think I was cut out for a farmer?" "Well, I guess you must be by the good accounts they give of you" she replied.

The boys returned home on Saturday greatly pleased with their visit and loud in their praises of the hospitality of the captain and his family. "Why," said Frank when describing the city, "my head was almost dizzy with the bustle, there is a lot more stir than in Fredericton, still I like Fredericton best." "I was in the bustle of London too long to let it affect me that way," laughed Charlie. "And," he continued, "I honestly thought I was in the country when I first landed at St. John. I do hate city life, give me the quiet country, the pure air and the freedom of the farm. Fredericton is the pretties little town I was ever in; the air is almost as pure as in the country." "Well said, my boy," laughed Mr. Brown. "You have seen a lot of the world for a young fellow so you ought to know. And you really prefer farming, raising the calves, pigs, etc., and driving horses?" "Yes sir I do. I must look around now and see if you have taken gokd care of everything," said Charlie with a laugh.

FELL AWAY TO A SHADOW.

All Her People Thought She Had CONSUMPTION.

Mrs. Wm. Martin, Lower Ship Harbor East, N.S., writes:—"I am sending you a testimonial of my cure by Dr. Wood's Norway Pine Syrup. Last May I took a cold, and it settled on my lungs. I got so bad I could not rest at night. I had two doctors to treat me but got no relief.

"All of my people thought I had Consumption. I had fallen away to a shadow. I had given up all hopes of ever getting better again until my daughter went to a store one day and bought me a bottle of Dr. Wood's Norway Pine Syrup. After taking half of it I felt better, so I got two more, and thanks to them I am well to-day, and able to do my house work. I cannot say too much in its praise, and I shall always keep it in the house."

Dr. Wood's Norway Pine Syrup contains all the lung healing virtues of the famous Norway Pine tree which makes it the very best preparation for Coughs, Colds and all Throat and Lung Troubles.

See that you get "Dr. Wood's" when you ask for it. There are many imitations on the market.

Price, 25 and 50 cents.

See that the name, The T. Milburn Co., Limited, is on the yellow wrapper.

ued for the next five years in almost the same groove. Charlie worked steadily for Mr. Brown two years longer, then he bought the colts he was so fond of, now a handsome full-grown team. After that he took his team in the woods in winter, and on the river drives in summer. In fact, he got work wherever he could and laid up considerable money. When out of work he was always welcomed home by the Browns, and he helped them until he got a job. His leave taking on going away was always a cause of sorrow to them as well as to him, and his return a time of rejoicing.

In June, 1910, the valuable property known as the Albright Farm was offered for sale. It was a valuable property containing two hundred acres including some intervale land, a fine new house and two good barns, in short, an up-to-date farm in every respect, and adjoining the farm of Robert Brown.

The farm complete with machinery and stock was offered for five thousand five hundred dollars for quick sale.

"Why don't you buy that farm Charlie?" asked Frank when they heard of it. "It is certainly a good bargain at those figures." "I have been thinking about it but I can't rake up even that much myself and I dislike going in debt." "And," continued Charlie, "It would just suit me because it is near you people. I should never feel like settling far from home." "Well you can make a pretty good payment likely, and mortgage for the balance. You could easily clear it in two years anyway, its a pity for you to let a bargain like that slip, if you want a farm. The place cuts lots of hay and has a large crop growing this year and that is included with the farm, and you can sell off some stock too, and help make up some more money that way. Go talk it over with father," said Frank. "Yes I will go and talk to your father about it, I am tired of living out for a living and I want a home of my own," replied Charlie. "Where is your father?" "He is just below the road there, hoeing cabbage." answered Frank. So Charlie took his hoe and went down to talk the matter over with Mr. Brown and help him in the meantime. That gentleman gave him some sound advice regarding the matter. " Why" he said, "it is just the palce for you. The buildings could hardly be put there for that price now. I can't see what possesses Albright to sell, but he has got the western fever like lots of others and will go West if he has to sell for half price, he is that kind of a man. He told me this morning that eleven head of cattle, one horse, one yearling colt, twenty sheep and the crops were included for quick sale. You will buy it, won't you Charlie?" "The only stick is the cash," said Charlie, well pleased that Mr. Brown was anxious for him to have it. "I have two thousand dollars and by selling off some stock and most of the crop should bring close on to another thousand. Then there is some standing lumber I would get this winter. Don't you think I could get some good man to advance me some money Mr. Brown? If so I shall buy it at once." asked Charlie. "Yes you can get a man to let you have the money but I don't know if he is a "good" one" laughed Mr. Brown, "for I will help you myself." "Oh, thank you," laughed Charlie, "I have every proof that you are good. When shall we make the purchase?" "To-morrow," said Mr. Brown. "No delays, for the place will go soon, it might be well for you to go over now and tell him you will buy it."

So Charlie Thorpe bought the Albright farm and was very proud of his possession and well he might be, as it is one of the best rural homes

BON TON

Apply Fertilizers In Early Spring

To insure the full benefit of fertilizers to the first crop the POTASH and Phosphatic fertilizer materials ought to be applied as soon as possible after the land is workable.

Where Nitrate of Soda is used as the source of Nitrogen this may be given as a top-dressing at the commencement of growth.

POTASH in the highly concentrated forms of

Muriate of Potash and Sulphate of Potash

may be secured from all leading Fertilizer Dealers and Seedsmen.

Write us for FREE copies of our illustrated Bulletin, prepared by agricultural experts.

If you send us the names of five (5) or more of your neighbor farmers, we shall send you and them a colored Wall Placard, illustrating the "After Effects of Fertilizers."

$9000 Farm for $5900

In Annapolis Valley.

Before owner's death this 210-acre farm was valued at $9000; the low price is to quickly settle estate; 100 acres very valuable wood and timber, estimated to pay for property; 600 fine apple trees and grand good chance to make large commercial orchard; 75-acre machine-worked tillage; pasture watered with trout brook; 2-story house, 50-foot barn; part cash, easy terms takes it; for all details and traveling instructions to see this and a rich valley farm for only $1900. Write Box D. Sussex, N. B.

in York County. So that winter he lumbered on his own place. "No more living out for me," he often used to say, and began work on the farm in earnest the following spring.

CHAPTER VII.

Early in the winter of 1912 a music teacher came to the Macnaquac and Queensbury neighborhood, and was successful in securing a large class. Her name was Irene Cooper, she was a farmer's daughter and her home was in Carleton County N. B. She was a tall, dark, brilliant looking girl, a skilled musician, and full of fun. She boarded with the Brown's, and Jessie was one of her pupils. When Frank Brown first met the beautiful girl, he was charmed, and as he afterwards confided to Charlie, he met his fate. Miss Cooper was equally interested in Frank, for indeed, he was a handsome manly fellow, an intimancy which later ripened into love. They seemed only happy in each other's company, and before six months elapsed, the brilliant young music teacher was the promised wife of Frank Brown. During the court-ship of Frank and Miss Cooper, Jessie and Charlie were left more than ever to each other's society and were very, very happy. Charlie had realized for years that Jessie was his ideal, but he was not sure if she regarded him in the same way, or only loved him as a brother. One beautiful June evening as they sat conversing side by side on the veranda, in the twilight, he resolved to tell her of his love and ask her to be his wife. He felt himself a coward for the first time in his life, as he realized that the happiness of his future depended on her answer.

"Jessie" abruptly exclaimed Charlie, "I want to tell you a secret, will you hear me?" "Why, of course, I will," said Jessie gaily, "that is, if you can trust me, you know they say "if one wants to spread news just tell a woman; but perhaps you don't believe in that saying, do you?" "No I don't," returned Charlie, "but don't jest, for it is a serious matter, to me, at least." "All right Charlie I will listen to you," she said soberly." "I am soon going over there to my own home to live," he said, pointing to his own beautiful residence on the adjoining farm, "and I am in love with the dearest little girl in the world, but I don't know if she returns it or not. Had I better run the risk and ask her or wait a while longer, the happiness of my life depends on her answer?"

Jessie remained silent for some time after Charlie stopped talking. She never thought of him being in love, and who could the girl be, and what would she (Jessie) do, when some other possessed the love of this noble, young hero. These thoughts flashed through her mind in a few moments, and she realized for the first time that Charlie Thorne was all the world to her, and that her own life would be a blank without him. Nevertheless she put aside her own feelings in the matter and said slowly: "She must be a nice girl or you could not love her so dearly. A love like yours should win a love in return, and in all probability she loves you more than you are aware of. What is her name, Charlie?" "Jessie Brown," returned Charlie. "The prettiest name in the world to me, can you love me in return?" and he put his arm fondly around her waist, and imprinted a first kiss on her rosy cheek. "Oh, Charlie" she said as she laid her head on his broad shoulder, "is it really me that you love so much? I was nearly broken-hearted when I thought it was some one else." And she put

POTATO GROWING COSTS CUT IN TWO

EUREKA PLANTER

Doubles your potato profits. Minimizes labor. Use a **Eureka Potato Planter.** Opens the furrow, drops seed accurately any distance or depth desired; puts on fertilizer if wanted, covers perfectly and marks for next row. Always plants uniform depth. Requires only one man. Driver sees seed drop. Made in three sizes, for 1 or 2 rows.

The Eureka Mulcher and Seeder

A mulcher, smoothing harrow, cultivator, weeder and seeder all combined. Forms dust mulch and conserves moisture. Three sizes, 8, 10 and 12 ft. Lever with pressure spring regulates depth of cut. Pulverizes the soil. Levels the ground. Teeth are flat and can be removed to cultivate in rows. The driver rides.
Seeding boxes can be easily attached to sow grass seed, alfalfa, oats, etc. Adjusts for seeding various quantities. Teeth cover seed thoroughly, either shallow or deep. Economical in price.

her arm around his neck and returned his caress. After a little more talk of their glad happiness and the bright prospects of the future Charlie said, "you have not told me yet if you will be my wife, dear?" "Because you did not ask me," returned Jessie with a happy laugh. "You will, darling," he asked, and Jessie answered softly, "Yes." "Come let us go in said Charlie. "Miss Cooper and Frank have returned and I must tell them all how happy you have made me."

They went into the cosy sitting room where the rest of the family were assembled and leading Jessie to her parents Charlie said: "Your daughter has promised to be my wife, all we want is your consent to make our happiness complete." "You have mine," said Mr. Brown kindly shaking hands. "And mine too," said Mrs. Brown kissing Jessie and shaking hands with Charlie. "God bless you both."

After Miss Cooper and Frank had tendered their congratulations the latter said: "So we are to be brothers indeed, Charlie?" "Yes," replied Charlie. "I am pleased to say we are." And it would be hard to find a happier household in all Canada than Robert Brown's. Miss Cooper accompanied by Frank returned home two weeks later.

"On the 25th of September, 1912, the residence of Mr. and Mrs. Robert Brown was the scene of an interesting event when their only daughter, Jessie, was united in marriage to Charlie Thorpe. Miss Irene Cooper, of Carleton County, was bridesmaid and Frank Brown acted as best man. The ceremony was performed on the veranda, which was beautifully decorated for the occasion, in the presence of over two hundred invited guests, among them being Captain and Mrs. Hammond and the Misses Hammond, St. John. The presents received by the happy couple were numerous and costly which testified to the high esteem in which the happy couple were held. The groom's present to the bride was fifty dollars in gold. From the bride's parents a handsome parlour suit, and the bride's brother a substantial check, and from Captain and Mrs. Hammond and the Misses Hammond a silver tea service. The happy couple left on the evening train on a honeymoon trip to Grand Falls, N. B."

The above is an extract from one of Fredericton's leading papers.

On their return Mr. and Mrs. Thorpe took up their abode on their farm and there they are living happily today.

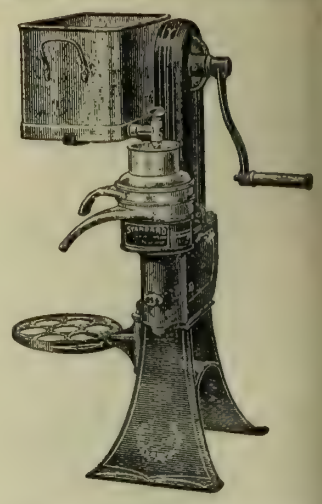
Charlie is considered one of our most prosperous young farmers of Queensbury, following all the latest methods of farming, that he has learned by reading and observation. He says there is as much or more in good management as there is in hard work. Around his farm and buildings inside and out is an example of neatness. This winter he is fattening some beef, and intends to go into raising and improving his stock.

In conversation with Mr. Brown recently he said. "I thought I had learned all about farming the first year I was with you, but I have got that idea out of my head long ago. I find there is something to learn every day, and I never expect to know it all." "Another winter," he continued, "I am going to plan to take a course at an agricultural college, for I expect to be out of debt long before that if I have my health."

Charlie Thorpe's home is a pleasant one. It is always a pleasure for any of his many friends to visit him, and the stranger is always welcomed and hospitably cared for.

And now just a glance at the personal appearance of our hero again and our story is done. He is now

The Record-Breaker



THE Standard Cream Separator has justly been named "The Record-Breaker" by creameries and dairymen. It has certainly made some remarkable skimming records at Ontario Agricultural College, Guelph, at Dominion of Canada Experimental Farms, Ottawa, at Wiarton Creamery, at Stratford Creamery, and others. The report of the records made by the

Standard

at the Eastern Dairy School at Kingston, and at the Kerwood Cheese and Butter Factory, were published a short time ago. They proved conclusively, that the Standard Cream Separator was unequalled for close-skimming. They go to show that right here in Canada is made the "World's Greatest Separator"—a fact, we believe, all Canadian dairymen will be proud of. If you are not familiar with the skimming records established by the Standard Cream Separator write us We will gladly send you particulars. But the best record of all, will be the record the Standard will make for you in everyday use in your dairy. It will do the same for you as it has done at Experimental Farms. All Standard Separators, of the same capacity, are identically alike. One Standard is as good as another, no matter who owns it.

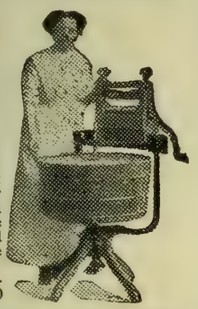
Dr. Morse's Indian Root Pills

are made according to a formula in use nearly a century ago among the Indians, and learned from them by Dr. Morse. Though repeated attempts have been made, by physicians and chemists, it has been found impossible to improve the formula or the pills. Dr. Morse's Indian Root Pills are a household remedy throughout the world for Constipation and all Kidney and Liver troubles. They act promptly and effectively, and

Cleanse the System

THIS WASHER MUST PAY FOR ITSELF.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.



So I told him I wanted to try the horse for a month. He said "All right," but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse was'nt "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now, this set me thinking,

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that, without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges, nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week 'till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

Address me personally;

F. O. MORRIS, Manager 1900 Washer Co'p'y.

357 Yonge Street, Toronto, Can.

WHY HE WAS LATE.

"What made you so late?"

"I met Smithson."

"Well that is no reason why you should be an hour late getting home to supper."

"I know, but I asked him how he was feeling, and he insisted on telling me about his stomach trouble."

"Did you tell him to take Chamberlaio's Tablets?"

"Sure, that is what he needs." Sold by all dealers.

nearly twenty-five years old, five feet ten inches tall and tips the scales at one hundred and seventy pounds, broad shouldered, muscular, with thick, black, curly hair, black mustache and black eyes, the picture of healthy, happy manhood and no taint of the dread consumption that drove him, nearly ten years ago, from England to seek his health in Canada, the land of promise. Loved and honored by all who know him, he and his wife are happy in each others love to the present day.

Why We Raise Good Fruit on Deer Island, N. B.

Editor of Maritime Farmer:—The reason why we grow good fruit on Deer Island, N. B. is because climate, soil, fertilizer and market are all in our favor.

Nature has bestowed upon us a perfect climate for raising apples and small fruits. During the winter season the thermometer seldom goes below zero, and never more than 15 degrees below zero, owing to the fact that we are surrounded by salt water and the damp atmosphere effects the frost and enables us to raise tender varieties such as Kings which do not thrive well in any other parts of the province. Also in the spring the damp air from the sea affects the frost so there is no danger to the blossoms.

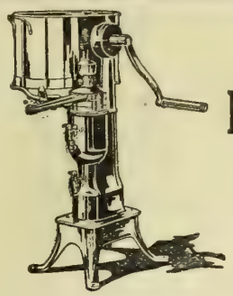
In autumn the season closes ten days later than in the interior of the Province which gives the fruit a good opportunity to colour and makes it a better price bringer in the market.

The soil varys from a gravel to a clay loam. On the shores of the Island it is rough and rocky but the interior of the island has rich and fertile valleys covered with a second growth of spruce, fir and hardwood. As the greater part of the population derive their living from fishing there is little done in the way of agriculture but this land cleared offers great opportunities to settlers raising apples and small fruit.

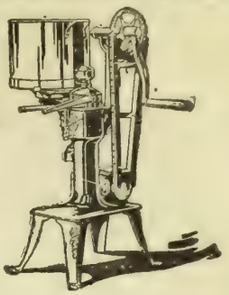
As a fertilizer and cultivator we raise hens in part of the orchard, having it enclosed in wire netting. The hen does her work thoroughly and the poultry and eggs are sold at a high price to the summer hotels. The other part of the orchard is ploughed and cultivated, using fish waste as a fertilizer. We believe strongly in spraying which is the only way to have clean fruit and fruit trees, spraying three times during the season with lime sulphur and arsenate of lead. We also prune the fruit trees every year and in some varieties thinning the fruit is necessary to get a large percentage of No. 1's.

In regard to varieties, the Astracan, Gravenstein, King, Bethel, Baldwin and Stark thrive here with care and compare well with fruit raised in the other parts of the province in size, color and flavor, having taken 3 first prizes on King apples in 1912 at the St. John Fruit exhibition including prizes on several other varieties.

Our market is among the best as thousands of barrels of apples are shipped into the country from Nova Scotia. Having raised 250 bbls. of apples the past season they found a ready market among the fishermen and town places at a price from $2.25 to $3.50 per bbl. We have communication by steamer with St. Andrews, St. Stephen and St. John. We store our fruit during the winter in a building made of concrete block ceiled inside and filled with saw dust. In regard to small fruits they succeed well here having raised 1500 quarts of strawberries from 1-3 of an acre the past season. —Edgar Martin, Fair Haven, Deer Island, N. B.



8500 Revolutions Per Minute



THAT is the wonderful speed at which an I H C separator bowl turns. The rim of a six-inch bowl, running at separating speed, is traveling at the rate of nearly two and a half miles a minute, faster than the swiftest express train that ever ran. Such speed as this means strain on shafts, bearings, gears, frame, in every part of a separator, such strain as can only be rendered harmless by the nicest adjustment of strength, flexibility, and quality of material and workmanship. The business of a cream separator is to skim the butter-fat from whole milk, but to do this it must be made mechanically right, or it soon ceases to be useful as a separator. The machine that meets these conditions and sells at the right price is an

I H C Cream Separator Bluebell or Dairymaid

I H C separators have that carefulness of adjustment and balancing of moving parts which make for durability and easy running.

There are points in the construction of I H C separators, such as the heavy phosphor bronze bushings, trouble-proof neck bearing, cut-away wings, dirt and milk-proof spiral gears, etc., which make I H C separators, beyond any doubt, the best of all to buy. There are four convenient sizes of each style. Ask the I H C local agent for demonstration. Get catalogues and full information from him or write the nearest branch house.

Encouraging the Fruit Buds.

Every fruit grower is interested in fruit bud formation. However, the subject is so comprehensive that investigations into the causes which bring about the formation of fruit buds, or means by which it can be controlled leads one into deep water. The New Hampshire experiment station has an experiment which promises more in this connection than any other, reaching the attention of the editor. The work has been in progress since 1908, 11 plots receiving different treatment, fully described in a bulletin from the station, written by Prof. B. S. Pickett.

While Prof. Pickett believes it too early to lay down hard and fast rules, he announces a few general observations which are very suggestive. Thorough cultivation throughout the season, May 15 to September 1, without the addition of cover crop or fertilizer, resulted in the production of three times as many blossoms or fruit buds, and somewhat more than three times as much fruit as no cultivation or sod culture provided.

Clean cultivation throughout the season produced considerably fewer buds, and a noticeably smaller amount of fruit than cultivation until July 10, with a cover crop of crimson clover sown with the last cultivation and plowed under the following spring. This indicates that while cultivation through the entire summer is far superior to sod culture, still better results are secured by stopping the cultivator and using a cover crop.

THE COVER CROP COMBINATION.

The results indicate that clean cultivation until July 10, followed by a cover crop of crimson clover, alternating every other year with a stand of mixed clover and grass, sown early in the spring, may produce a sufficient number of fruit buds for a satisfactory crop. This cannot be conclusively shown until the experiment has progressed at least one more season.

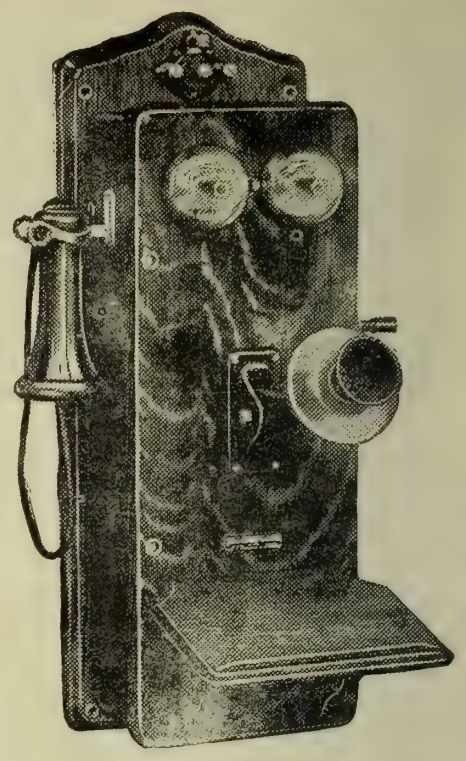
Cultivation and cover crop one year in three produced only two-thirds as maky fruit buds and half as many apples as cultivation two years in three. Cultivation and cover crop one year in three doubled the production of fruit buds and increased the crop of apples three times, compared with no cultivation at all. Cultivation and cover crop two years in three gave almost as good results as cultivation and cover crop yearly.

The use of fertilizers in addition to cultivation and cover crops failed to result in an increased production of fruit buds. The use of fertilizer relatively rich in phosphoric acid (in the form of acid phosphate) resulted in the lowest production of fruit buds among the fertilized plots. The number of fruit buds was not increased by the excess applications of nitrogen and phosphoric acid over normal applications. The number of fruit buds appeared to be slightly increased by the application of an excess of potash but the difference was hardly noticeable in the crop. The number of fruit buds was noticeably greater in a plot to which was applied agricultural lime, than in a corresponding check plot.

Continuing his description, Prof. Pickett says: "It has been clearly and completely proved that apple trees are unable to produce fruit buds when grown in sod as compared with cultivation. A general review of results for 1910 indicated that a plentiful supply of moisture (as a result of conservation by cultivation was the most influential factor in stimulating the production of fruit buds. The addition of nitrogen in the form of a cover crop appeared to be the second most important factor in stimulating the production of fruit buds."

While fertilizers failed to stimulate

Put The Latest Style Telephones On Your Lines



INCREASE the efficiency of your telephone system by installing the latest style telephones. Canadian Independent Telephones are the highest grade made. We guarantee them to be superior in style, workmanship and material to any others on the market. You can prove this true by trying them out on your own lines, side by side with other phones. This you can do without risking a cent. Just ask us about our Free Trial Offer.

Get Our Advice If your locality does not enjoy the social and business advantages afforded by an up-to-date telephone service it is time you got into communication with us. We are the largest Independent Telephone Manufacturers in Canada, and have been instrumental in seeing that the majority of the independent local and municipal companies have started into telephone business along lines that insure success. We can help you get a telephone line for your locality. Write us and we will tell you how.

The No. 3 Bulletin This is the latest book published on building rural telephone lines. It is complete in every respect. Write for a copy. We will also send you an illustrated description of our desk set, the most up-to-date on the market, and our portable telephone or test set if you are interested.

No Experience Needed

You do not have to be an expert gardener to be able to make a good selection of vegetable and flower seeds from Ewing's new 1913 Catalogue. Not at all. For

EWING'S Reliable Seeds

listed in this Catalogue are all vigorous, "pure-bred" seeds of good varieties, each one of which is so clearly and accurately described that it is a simple matter to select those best suited for your particular garden.

Whichever ones you choose, you can count on the same satisfactory crops which have been grown in Canada for more than forty years from Ewing's Reliable Seeds.

Write now for our illustrated Catalogue, and if your dealer hasn't Ewing's Seeds, order from us direct.

WM. EWING & CO., Seedsmen

McGILL ST., MONTREAL. 26

a greater production of fruit buds, they clearly improved the size and quality of the fruit, the largest quantity of No. 1 fruit per tree being produced in the limed plot. This plot was fertilized, each section receiving fertilizer treatment of the plot which crossed it. The next largest quantity of No. 1 fruit per tree was produced in the plot which received the excess of potash.

The fewest No. 1 apples were produced by the sod plot, but the same plot produced the most highly colored fruit. Among the fertilized plots, the excess phosphoric acid piece produced the smallest apples, though the fruit ran uniformly of good quality. All plots were sprayed alike; the relatively small number of buds produced by the sod plot would indicate that spraying had only an indirect influence on fruit bud formation.

Summing up the whole work, Prof. Pickett says: "The summary of three years' work indicates a startling effect in increased productiveness under cultivation, cover crop and fertilization. When the experiment started, the sod plot produced more apples to the tree than any in the orchard. Hence, we conclude that portion must have had at least equal and perhaps superior advantages to start with. However, immediately after cultivation, fertilization and cover cropping were practiced in other plots in the orchard, the production of the sod plot fell far behind."

Rhubarb a Good Crop.

Rhubarb pays as well as any other garden crop in winter and spring and sometimes in summer and fall. Perhaps better. The grower can enjoy it even in the middle of winter, with little trouble and expense. All that is needed is a warm cellar, or a space under a greenhouse bench, where some clumps of roots dug up at the beginning of winter may be planted. It will grow in the dark and make most brittle, most appetizing stalks and a lot of them in a very small and crowded space. It requires only a very moderate temperature, from 40 to 50 degrees up to 60 or 65 degrees.

The one thing most necessary, in order to grow it for sale on a large scale, is a corresponding number of clumps of roots, and provisions for them to give a crop next winter should be made now. Plant at once a good-sized new bed, so that the old clumps or a part of them can be taken up at the beginning of next winter for forcing.

If the new bed is started from good, strong roots, even if a little late, it will make growh enough under good culture to give a full crop next spring and summer. The stalks will be fewer in number, but much larger and fatter and more valuable.

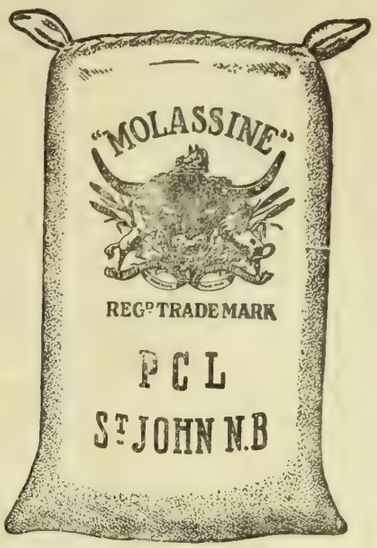
Who Will Win.

F. W. Short, proprietor of Orchard Hill Farm, Brown's Flats, N. B., is offering a special prize of $2.00 at the 1913 Maritime Winter Fair for the best pair of Columbians hatched during 1913, from eggs purchased from his yards. This should be an extra inducement for Columbian breeders to purchase a setting of eggs from Orchard Hill Farm.

You will look a good while before you find a better medicine for coughs and colds than Chamberlain's Cough Remedy. It not only gives relief—it cures. Try it when you have a cough or cold, and you are certain to be pleased with the prompt cure it will effect. For sale by all dealers.

GOVERNMENT ANALYSIS

Send to the Department of Inland Revenue, Ottawa, and ask for Bulletin No. 241 on Registered Stock Foods. It will be sent you FREE of all costs. In this Bulletin you will find the analysis of the different livestock preparations. You will also find that MOLASSINE MEAL, referred to on pages 6, 7, 12 and 13, is found to be 50% above the guarantee in protides and fat—and below its allowance of fibre or waste matter.



MOLASSINE MEAL

Made in England

Do not confuse MOLASSINE MEAL with other molasses preparations. There is only ONE MOLASSINE MEAL and that is made in England. It is recognized all over great Britain as the greatest Livestock Feed known to science. The leading veterinary surgeons all recommend it—The Mounted Department of the British Army use it—The Large Carting Companies, Omnibus Companies and owners of horses doing heavy work or for show and breeding purposes, all use it. It prevents and eradicates worms, enables you to get the best work out of horses—Cows will give more milk with greater percentage of butter-fat—Steers can be fattened for market quicker and cheaper and all your stock will be in better condition when fed regularly with MOLASSINE MEAL.

See that this Trade Mark is on Every Bag.

MOLASSINE MEAL can be obtained at most leading Feed Dealers—but if you can't get it from your dealer write us direct and we will arrange with him to supply you.

Try this Thirsty Flour

A *very* thirsty flour. Absorbs a lot of water.
Because it contains so much *gluten.*
Manitoba wheat is wonderfully rich in *sturdy* gluten.
And, think of it, FIVE ROSES is milled *exclusively* from the very *cream* of the Manitoba wheat berries.
So FIVE ROSES must be awfully thirsty, don't you see.
In your mixing bowl it greedily absorbs *more* water.
So you get *more* loaves than usual without using more flour. You use *less.*
Your flour lasts *longer,* doesn't it?
Less trips to your dealer.
That's how FIVE ROSES saves money.
Actually saves YOU money.
Use this *economical* flour.

We prepay transportation charges on all orders amounting to $5.00 and over in Quebec, Maritime Provinces and Ontario, except West and North of Sudbury and Sault Ste. Marie.

To customers living in the West, we will allow a discount of 5% to help pay your transportation charges. This 5% will be refunded when the goods are shipped.

Scroggie's Personal Mail Service is a new service — it has just been inaugurated — it is not Mail Order—it has no relation to Mail Order the way it is at present conducted elsewhere. Your letter for merchandise is not dropped into a bag or pigeon-hole, taken out in routine order, filled without regard to your evident taste, jammed into a box and rushed back the easiest way possible.

The Scroggie Personal Mail Service is altogether different. It places at your disposal a personal representative, a trained and experienced shopper, one with an intimate and varied knowledge of this large store's stocks. When your letter reaches us it goes straight to the desk of the correspondent who will act as your personal agent, serve you, and continue to serve you as long as you require. It will be to his or her interest to serve you well, for their success will depend on their record of satisfied customers.

This new service will eliminate delays, prevent errors, and stand as an insurance against the disappointments of the present Mail Order System. Try it.

Adding Power to the Farm

Your *power* to make money by getting as *much* profit from your farm as you *should* get---depends upon how much you *know*. The owner of a Telephone knows---when the other fellow has to *guess* and probably guess wrong. That's why a Northern Electric Telephone will add power to your farm---power to make more money.

Facts That Speak For Themselves

Supposing you had produce to sell—butter, eggs, poultry, fruit or livestock—and you could *know* when to sell so as to get the *highest* prices, that would be a good power to have—wouldn't it? And supposing you could know in advance whether there was going to be frost—or rain—or snow—in time to save your crops, that would also be a great power, wouldn't it? Then supposing that you had the power to talk to the town—right from your own home—the doctor, the veterinary, the mill, the farm machinery factory, the forge, or that son or daughter in the city,—at any time you wanted to, that would be great—wouldn't it?

A Northern Electric Telephone Will Give You This Power

You And Your Friends

Can build, own and operate your own Rural Telephone System at a *cost* to each of about the *value of 20 bushels of wheat.*

Our Free Book

Tells you how to form a company among your neighbors and how to build the system from start to finish by your own labor.

It Explains Everything

In simple, straightforward language that even a child could understand. It makes the work of construction as easy as building a fence.

We Will Help You

The Northern Electric & Mfg. Co., Limited—the oldest and largest Telephone manufacturers in Canada—will back you up and guide you and advise you in every step of the work until success is assured.

When You Are Ready

To purchase the equipment write to our nearest house and our experts will place their knowledge at your disposal. And remember that Northern Electric equipment costs no more than many inferior makes, and is the best Telephone equipment money can buy.

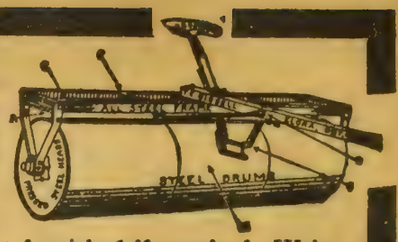
THE MARITIME FARMER, SUSSEX, N. B.

The "Bissell" is a 3-drum roller

3 DRUMS make the best Land Roller. It is easy to understand how the "Bissell" Roller with 3 drums and supported by 6 heads is a STRONGER IMPLEMENT than any 2 drum Roller on the market. With 3 drums the centre bearing is not needed. When the "Bissell" Roller is at work, the axle turns with the drums.

It costs more to manufacture the 3 drum Roller than the 2 drum, but you pay no more for the "Bissell" 3 drum and get BETTER VALUE FOR YOUR MONEY. You get heavier weight in the "Bissell" drums too.

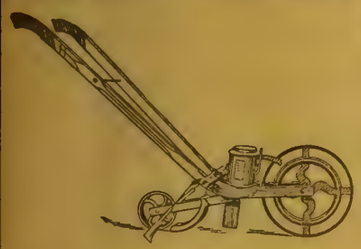
The good points cannot all be told here. Ask your dealer about the "Bissell" Roller and do not be put off with a Roller unless the name "Bissell" is plainly stencilled thereon.



Grass Seeder Attachment furnished if required. Write Dept. M for free catalogue. 63

T. E. BISSELL CO., LIMITED, ELORA, ONT.

GARDEN SEEDERS



Our **seeder** has years of success behind it and with improvements recently added, makes it without a doubt the best machine of the kind on the market.

The seed discharge of this machine can be exactly regulated by moving the steel plate at the base of the seed cup as per directions on the side of each seed cup. **The flow of seed** can be instantly stopped by a **swinging cut-off** operated by a chain attached to the handle. This prevents any loss of seed at the end of the row.

The marker is held firmly in place and is easily adjusted. **The covering wheel** is attached to a swinging frame and by varying pressure on the handles, the operator can roll lightly or otherwise. **The main wheel** is high with a wide rim which keeps it from sinking into the soft earth.

Each year finds the demand for our garden seeders greatly increased. No better **seeder** can be built for accurate and fast sowing of **turnip, cabbage, sage, carrot, onion, parsnip, spinach, beet, pea, corn** and all other kinds of **garden seed.**

Every machine carries our **absolute guarantee.**

Don't Spend Your Money on Incomplete Fertilizers

Ask any agricultural expert.

Any crop in Canada consumes at least three times as much **POTASH** as phosphoric acid. But you will have difficulty in finding any fertilizer that contains three times as much **POTASH** as phosphoric acid.

In fact, most low-grade fertilizers, instead of containing three times, contain only one-third as much **POTASH** as phosphoric acid. They contain about 2% **POTASH** and 8% phosphoric acid.

So, when you use a less-than-10% **POTASH** fertilizer you are not getting the crops you should from your land. You are not earning all that you should from your farm.

It is a matter of good, hard dollars and cents with you. The question is: Are you content to lose money on your farm—for you are losing money when you are not raising as large crops as you might—or would you rather use a complete—a 10% **POTASH** fertilizer—and get maximum crops?

By some of the very best scientific tests—by the knowledge of the best agricultural experts in the country—by the actual experience of many farmers in Canada, we can prove to you that

'POTASH PAYS'

By this, we mean that it will pay you real money to use a 10% **POTASH** fertilizer.

If you want to raise the largest possible crops on your land this year, make absolutely sure of doing this:—Insist that your dealer give you a 10% **POTASH** fertilizer. If he hasn't got this, add enough **POTASH** to the fertilizer he has got to increase the **POTASH** content to 10%. Or you can make your own fertilizer at home if you want to. Our experts will tell you just how to do either of these things.

In fact, our experts will be very glad to tell you anything they can in regard to increasing the yield from your farm. Write them. Get our free booklets. Get our advice on how best to raise your crops.

If your dealer dosen't handle **POTASH**, send us his name and we will see that you are supplied immediately. Don't waste your money on a fertilizer that is not going to get the best results from your land. Decide NOW to make your farm yield a big crop this year.

Write immediately for full information and prices of **POTASH**. **"POTASH Pays."** Let us prove it to you.

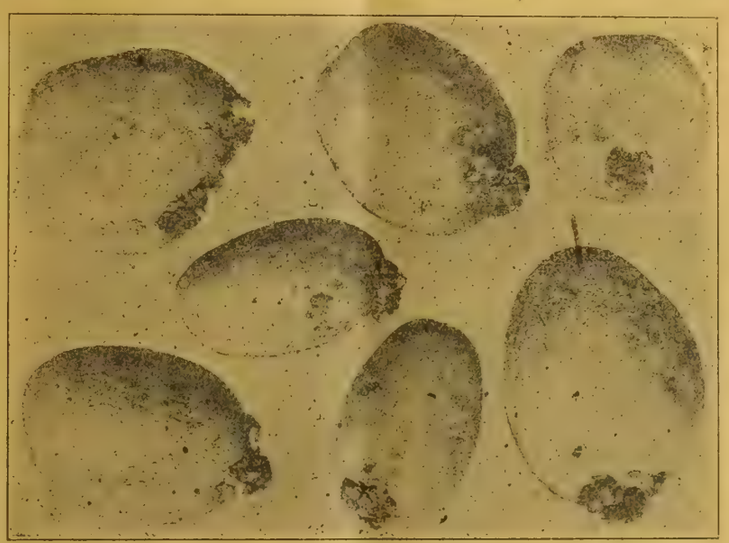
Volume 18. SUSSEX, NEW BRUNSWICK, APRIL 29, 1913. Number 14.

Illegal to Use, For Seed Purposes, Potatoes Imported From Europe

THE potato harvest of the Dominion in 1911 was considerably below the mark, and as a consequence importations of potatoes from abroad became a universal practice. The total imports into Canada from European countries during the year ending March 31, 1911, was 720 bushels. But from October 1, 1911, to March 31, 1312, as many as 200,000 bushels and more have been imported into Canada from Europe. It has been repeatedly pointed out that there exist in several European countries potato diseases new to this country, and owing to the fact that Liverpool is practically the centre of the exportations, and incidentally the centre of a badly infected area, the importation together with the potatoes of one or more diseases into Canada became very probable. The general prohibition of the importation of potatoes from Europe would have been advisable under ordinary circumstances, but partly because our crop was deplorably short, and partly because the imported potatoes were primarily intended for consumption, the question of prohibiting the entire importations, though carefully considered, was decided to be inadaisable. But when the planting season approached and inquiries concerning the use for seed of imported potatoes became more and more numerous, it was realized at once that the planting of diseased imported tubers would almost certainly be the means of establishing the one or the other of these undesirable diseases. For this reason the following order in council was passed without delay: "It shall be illegal to sell, offer for sale, dispose of in any way, receive or use, for seed purposes, any potatoes imported from Europe."



Potato Canker (Chrysophlyctis Endobiotica Schilb) as it Occurred on Potatoes Imported Into Canada from England.

The use for seed of such potatoes has been prohibited mainly because of the danger of introducing into the Canadian soil two new potato diseases, Potato Canker (Chrysophlyctis endobiotica Schilb.), and Corky Scab (Spongospora subterranea Johns.) The former of these two diseases hbs been actually discovered in a shipment from England. Hence, it will be obvious that the repeated warnings have been necessary. Besides, experiments have shown that in our climate and soil European potatoes do not yield satisfactorily. We reproduce herewith photographs of diseased tubers taken from the affected carload of potatoes imported into Canada, showing plainly the peculiar warty outgrowths from the neighborhood of the eye or eyes so characteristic of Potato Canker. Muco attention is necessary to establish the identity of the disease in this condition. We have examined a large number of tubers where the primary shoots growing from the eyes have become crushed and mutilated, resembling very closely the appearance of canker. Here microscopical evidence can only reveal the true nature of these growths. This being out of the question where farmers are concerned, from whom one cannot expect the necessary technical knowledge to determine accurately the nature of the trouble, the prohibition of the use of imported tubers for seed purposes became the only alternative. To facilitate this precaution, the following order was also passed by Order in Council:—

"Every person using for seed other potatoes than such as have been raised by himself must obtain, preserve and exhibit on demand, previous to planting, a certificate from the seller or his agent stating that the potatoes to be used for seed have not been imported from Europe."

The following provisions have been copied from the Destructive Insect and Pest Act and should be carefully studied, as any farmer or grower on whose land this Potato Canker or any Corky Scab disease is subsequently found will be asked to furnish evidence of the origin of the potatoes used for seed. Anybody found to have contravened the Act or any regulation will not only render himself liable to a fine or imprisonment provided under the Act, but will also forfeit the entire crop without any compensation.

"Compensation not exceeding two-thirds of the value as assessed by the inspector, of the vegetation or vegetable matter or containers thereof destroyed by the instruction of an inspector, shall be granted by the Governor in Council upon the recommendation of the Minister, except in cases where these regulations are carried out under the direction of the government of a province not granting compensation, or in the case o potatoes or potato crops."

"Every person who contravenes any provision of this Act or any regulation made thereunder, shall be liable, upon summary conviction, to a fine not exceeding one hundred dollars, or to imprisonment for a term not exceeding six months, or to both fine and imprisonment. Any vegetable matter imported or brought into Canada contrary to this Act, or to any regulation made thereunder, shall be forfeited to the Crown,"

"The owner, occupier or lessee of any premises or place where any of the insects, pests or diseases specified herein shall be found, shall immediately notify the minister, and shall also send to him specimens of such insects, pests or diseases."

Any one desiring further information about this Potato Canker is referred to Bulletin 63 of the Experimental Farm series (Division of Botany), and Farmers' Circular No. 1, obtainable free of charge from the Experimental Farm, Ottawa.

"CORKY" SCAB OF POTATOES.

(Spongospora subterranea Johns.)

No record regarding the occurrence of this disease on this side of the Atlantic has become known up to date of writing. Although the disease has part of its name in common with the ordinary potato scab it is in no way related, nor does it even closely resemble the common potato scab. Probably the name 'Powdery Scab,' or incrustations on the surface of potatoes in this disease are filled with a powdery, olive-green mass composed entirely of the spores of the fungus Spongospora. They are often present in such dense masses as to appear like the spore powder of smut fungi. The common potato scab does not alter the shape of the tuber, whereas the powdery scab frequently produced

gnarled, knobby tubers covered with deep sores, almost totally unfit for any purpose. The fungus, or more correctly speaking, the slime fungus (Myxomycete) belongs to the same group of organisms as that causing Club Root)Plasmodiophora) in turnips and other related plants. It produces millions of perforated spores which infest the soil and any sound tubers that may come into contact with diseased ones. The disease is widely spread in Europe, hence it affords one more reason to abstain from using imported potatoes for seed purposes. The great danger of introducing new diseases into any country should be fully realized. The examples afforded by the ravages of the Late Blight of potatoes (Phyto. phthora infestans), which disease has also been introduced from abroad, should suffice to impress any sceptical person of its serious importance and the responsibility of any grower who commits 'an error of judgment.' To spray potatoes, as they should be sprayed, to prevent any losses from Late Blight, costs, inclusive of labor and material, twenty-four dollars per statute acre. This expenditure, however, may save every cent of loss, while spraying to prevent Potato Canker and Corky Scab has been found of no value whatever.

A large quantity of imported tubers have been examined. While it must be said that some were of remarkably fine quality, there were whole consignments that showed Dry Rot, Rhizoctonia, Scab, Late Blight, Sprain and Bacterial Rots to such an extent as to be useless for any purpose.

The risks involved from the introduction of new diseases are far more serious than may appear. It is not a question of injuring the crops and purses of one or more growers, but the whole industry of a nation may be seriously compromised. The sooner this question receives international attention the better, for only by international agreement will it be possible to prevent the wholesale exportation of diseased vegetation, and thus the distribution all the world over of diseases against which every country spends thousands of dollars annually in its efforts of control, but which it shows no concern about when exporting into any other country.

'RHIZOCTONIA' DISEASE OF POTATOES.

(Corticium vagum B. & C. var Solani Burt.)

Very frequently there may be found firmly adhering to the surface of potato tubers, small, dark-brown bodies of varying form, and ranging in size from a pin's head up to ¼ of an inch or so in diameter. They are usually comparatively inconspicuous when dry, but on wetting the surface of the tuber they show up distinctly. These bodies are masses of resting mycelium—commonly, but in this case perhaps, not quite correctly, termed sclerotia—of a fungus. Under the right conditions of temperature and moisture, these 'sclerotia' give rise to a characteristic mycelium which was long supposed to be incapable of producing spores (i. e., a sterile mycelium) and placed in the form genus Rhizotonia. In comparatively recent years, however, it has been demonstrated that this Rhizoctonia on the potato is identical with the Basidiomycete Corticium vagum Bl & C., the latter being the spore-bearing stage. This latter name is therefore given above, as the correct scientific one, while the name Rhizoctonia is also retained as being the one under which the disease is best known.

Fungi similar to the Rhizoctonia stage of the fungus attacking potatoes are also known to cause serious diseases of many cultivated plants, for instance a form of the 'damping off' of seedlings, and various root and stem rots of beets, beans,, lettuce, tomatoes, etc. Whether many or all of these belong to the same species or not remains to be proved, but there stems considerable likelihood of this being the case.

While the 'selerotia' adhering to the potato tuber are quite superficial and not associated with any rotting or other injury of the tuber, the conditions which have just been mentioned, as leading to the production of mycelium from them, are fulfilled when the tubers are planted. This mycelium which now develops is capable of causing quite a serious disease of the potato crop, attacking the underground stems and roots and also the stem above ground. The effects of this infection shows themselves in a variety of ways. Commonly a brown, sunken 'cankered' area may be found extending along the stem just above the level of the ground. In bad cases this may go right around the stem, 'girdling' it and causing it to dry up. This mode of attack frequently destroys large numbers of young shoots as they make their way above ground. When the tops have reached a fair size, but the underground parts which normally bear the young tubers have been attacked and destroyed to a considerable extent, a cluster of small tubers

Potato Plant the whole field of which is Affected by the Canker.

is often formed at the base of the stem just below the level of the ground. This form of the disease is designated 'little potato'; it is often associated with the formation of the small leafy, green or purplish tubers in the axils of the leaves above ground (aerial tubers). Both phenomena in fact are due to the same cause, a surplus of food substances manufactured by the leaves aad not used up in the usual way. Sometimes the disease manifests itself in a shortening of the shoot, the leaves being close together. The appearance resulting from this has suggested the name 'potato rosette' commonly applied to it.

The spore-producing or perfect stage of the fungus according to our experience does not seem very abundant. Some very good examples, however, were observed in British Columbia, some have been sent in during the past season from the Province of Alberta, and others were found on the Farm here. It appears to be restricted to the living host plant, and forms an adherent gray very delicate and easily removable layer for a distance of two or three inches or more along the stem or branches above ground.

Diseases due to species of Rhizoctonia as 'soil diseases.' By this is meant that once the organism has been introduced into the soil, it has the power of persisting there from year to year, waiting the opportunity, so to speak, to attack any susceptible crop that may be planted therein. If, as seems probable, the Rhizoctonia diseases affecting a considerable number of plants are due to one and the same fungus, the danger of introducing the disease into uninfected land is obvious. It is quite true that sometimes the fungus may be present in considerable amount, and yet the resulting disease may only be slight, but this is simply because, as with all fungus diseases, other factors, of which for the most part we know little, influence the virulence of the parasite or the resistance of the host. It is at least equally true that when conditions favours the fungus, serious results may follow, and therefore if the fungus be present there is always the danger of such results. Hence it is most important to avoid introducing the fungus into uncontaminated soil. Although mention has just been made of a spore-bearing stage, yet there is little doubt that the parasite is mainly disseminated by the 'sclerotia.' It would greatly reduce the danger of infecting healthy soil if only tubers quite free from disease were used for 'seed.' As, however, in practice this is almost impossible to carry out, tubers which appear to be free from disease should be selected and subjected to some treatment that will kill any sclerotia adhering to them. For this purpose the treatment so widely used against potato scab is generally recommended, but does not seem to have given uniformly satisfactory results. In this connection an experiment conducted at the Central Experimental Farm this season yielded some interesting results. Two lots of potatoes, both badly and about equally affected with sclerotia were taken. One lot was soaked for three hours in formaldehyde solution of the strength usually employed against potato scab, viz., ½ lb. in 15 gallons of water. The other lot was soaked the same length of time in a solution of 1 part, by weight, of corrosive sublimate in 2,000 parts, by weight, of water. This is half the strength and twice the time usually employed against potato scab. The tubers at the expiration of the treatment were removed from the solution, spread out till dry cut and planted in beds in the same plot of ground. At harvest time it was found that the tubers grown from the 'seed' treated with formalin were almost as badly covered with sclerotia as those originally planted, while those from the tubers treated with corrosive sublimate were practically clean. It would seem, therefore that treatment with corrosive sublimate in the manner indicated is much the more effective measure against this disease, while it is certainly just as reliable as the formalin against scab. The chief objection to the use of this chemical is its deadly nature as a poison if taken internally, so that all reasonable precautioms should be taken in using it. It should also be mentioned that the solution corrodes most metals and should therefore be prepared in a wooden vessel.

Apart from treating the 'seed' in the manner indicated there is little to be done. No remedy is available for plants once attacked, and applications to the soil seem to have little valhe. In some Rhizoctonia diseases applications of lime to the soil have been found useful, but such alkaline dressings have a marked tendency to increase the severity of potato scab, and if this disease be also present the amount of harm done in this way would likely more than counterbalance any possible good in checking of the Rhizoctonia.

The question of distributing this disease by means of affected tubers became very prominent at the time of sending out small samples of seed potatoes from the Farm, when it was found almost impossible to secure sound smooth tubers. For the purpose of preventing this disease it was suggested to treat the tubers in the above manner with corrosive sublimate before sending them out to the farmers. The objection, however, was raised that the quantity of poison adhering to the surface of the tuber might have fatal or injurious results, should any of these potatoes be used for food, instead of for planting as intended. To ascertain whether a quantity sufficiently large to cause inury to persons consuming treated potatoes, the Dominion Chemist, Mr. Frank T. Shutt, M. A., kindly undertook to investigate this matter, and the results of his labors are herewith incorporated, with his kind permission:—

RE TREATMENT OF POTATOES BY MERCURIC BICHLORIDE Corrosive Sublimate.)

We have carried out a series of experiments to determine the amount of mercuric bichloride that might be absorbed or retained by any given weight of potatoes on treatment for Rhizoctonia.

The treatment considered in soaking the tubers for three hours in a solu- of mercuric bichloride of the strength 1—2000, removing them from the solution and , without rinsing, allowing them to dry by exposure to the atmosphere at room temperature. The potatoes analysed were examined 24 hours after treatment.

Two methods were adopted; the first, a direct one, in which the amount of mercuric bichloride in or on the potatoes was determined, the second, an indirect one, in which the amount of this compound removed from the solution by the potatoes was ascertained. It is satisfactory to note that the results by both methods were closely concordant.

Omitting the details of the various methods used in the analysis of the tubers and the solution; it will suffice to state that we found 3 pounds of potatoes (13 tubers) after treatment to contain, approximately .052 grams mercuric bichloride. By analysis of the solution used in their treatment it was found that its content of the fungicide, i. e. its strength had been reduced 10 per cent, which on calculation showed that 3 pounds of potatoes had removed approximately, .05 grams bichloride.

The usual dose of mercuric bichloride is between 1-32 and 1-16 of a grain, and the maximum official dose is 1-8 grain. There are apparently many cases on record of fatal poisoning by this chemical, but it is stated by an eminent authority on toxicology that .19 grams (approximately 3 grains) have proved fatal.

The amount of mercuric bichloride, according to our findings, contained on or in 3 pounds of treated potatoes is approximately .05 grams or 3-4 grain, an amount equal to 6 maximum official doses. This, in my opinion, would render it highly desirable that the treated potatoes sent out should be accompanied by a statement that the tubers had been treated and are in consequence non-edible.

A fact of some interest that has been brought to light in connection with this treatment is that the strength of the solution is materially reduced by the potatoes. This, I think, points to the necessity of rejecting the solution after it has been used three or our times, and a freshly prepared one substituted.

(Sgd.) FRANK T. SHUTT,
Dominion Chemist.

From the above analysis it is quite evident that serious consequences may be entailed from the consumption of potatoes treated with so weak a solution as 1 in 2000 corrosive sublimate.

The analysis brought out, however, another very interesting fact, i. e., the material reduction of the strength of the solution. This point has to my knowledge never been exposed,

and it seems reasonable to deduct that the removal from the solution of the ingredient used to kill the fungus no doubt accounts for the often limited success in preventing the reappearance of diseases, which might have been assured by employing a fresh solution after treating a quantity of tubers. An experiment will be undertaken with the view of observing the action of the solution by using it over and over again.

Potato Growing on Hill View Farm.

Editor Maritime Farmer:

In response to your request for photos of farm scenes I am enclosing two snap shots. One is that of a sixteen months old hog raised on my farm which when killed and dressed, weighed 614 pounds. The other photo is a potato harvesting scene on my farm in 1912.

The piece of land that the potatoes were grown on contained one acre, from which was dug and stored at digging time 412 bus. Perhaps it will be of interest to some to know how I raised them. I make it a rule to grow buckwheat, to lighten the soil, on the piece of land I ntend to raise potatoes on the next year. The land was plowed in the fall after the butkwheat was gathered in, and disced in the spring and leveled off with a springtooth harrow. It was then furrowed out into rows 30 ins. apart. The manure hauled direct from the manure cellar and put in the rows and leveled, about fourteen ton to the acre.) Then some complete fertilizer was dropped in the row and a little ground covered over it and the sets put on it, 14 ins. apart in the row, with the eye up, two eyes cut to a set. The sets were then plowed in, and in about a week or a little more I harrowed down the piece to cut and kill all the weeds that had started to grow by that time. The fertilizer used was 200 cwt. of my own mixture, consisting of dog-fish scraps, Potash and Slag, which I find much cheaper than any fertilizer on the market that would carry the same amount of Nitrogen, Phosphoric Acid and Potash, and 300 cwt; of "Stockbridges Best." Then as soon at the potatoes were up 4 or 5 inches I started to cultivate. In a dry season I cultivated once or twice a week. If wet, I do not cultivate so often. I keep on cultivating until I cannot get through the rows.—F. W. Grant, Barss Corner, N. S.

Methods of Improving the Supply of Field Root and Vegetable Seed.

It is estimated that 250,000 acres are annually devoted to field root and garden vegetable crops in all of the provinces. The areas devoted to field roots have materially decreased during the last 20 years. Ensilage corn is a succulent fodder, that is probably more economical of production and has largely supplanted field roots. The records of the census enumerator would indicate that the areas annually devoted to garden crops have increased with our increase in population; especially areas adjacent to our principle centres of population.

Hog Raised on the Hill View Farm.
16 Months Old When Killed and Dressed 614 lbs.

Potato Digging on the Farm of F. W. Grant, Fall, 1912

¶ **Mr. J. H. Wright will travel through the counties of Digby, Annapolis and Kings during the Summer of 1913 in the interests of the *Maritime Farmer*. He is authorized to take ad. orders, new subscriptions and collect for renewals.**

CULTURAL METHODS IMPORTANT

There are several factors that make for success in the production of these crops, some of which are equally, if not, more important than the quality of the seeds used. High class seeds will not produce a satisfactory crop unless the cultural methods and the quality of the soil is also superior for the particular kind of crop that is grown.

From a personal inspection of these crops in different provinces during the last two years, it is my opinion that crop failure is generally to be attributed to the want of good cultural methods, due sometimes to ignorance on the part of the grower, but mainly, to the great scarcity, the high cost, and, to the inefficiency of farm labour.

CAAADIAN SEED SUPPLY OF AVERAGE QUALITY.

The supply of field root and garden seeds in Canada is on the whole of about average quality, better in fact than the average care that is given of the crops produced from the seed. As a rule where superior intelligence and care as to the culture of crops is employed, a superior quality of seed to produce the crops is also obtained. The results of our trial plot tests with field roots make clear that whether the seed is superior or inferior to the average quality depends, so far as the Canadian farmer is concerned, largely on the seedsman, but even our most competent seedsmen occasionally fall short of their average standard of excellence with some varieties of their seeds. Some of our seedsmen procure supplies, that on the average for all kinds, are superior in quality to that of the average imported and sold by other seedsmen. From a careful study of our trial plot test with field root seeds, one would be forced to the conclusion that the seed stocks imported by some seedsmen had been purchased by them with a greater consideration to the matter of immediate profit, than to building up, and maintaining a reputation for selling good seed. Doubtless trial plot tests with garden vegetable seeds would show similar results.

WHY ROOT AED GARDEN SEEDS ARE IMPORTED.

With the exception of sweet corn, beans, peas and tomatoes, practically all of our seed supplies for field root and vegetable crops are imported. The great bulk of them come from Europe. They are grown in France, Germany, Scandinavia, and England, under soil and climatic conditions actually less favorable for the development and maturing of seeds than the varying conditions of soils and climates in the different parts of Canada. The result of experiments conducted at Waterloo, Ont., combined with individual effort on the part of a few farmers and gardeners scattered over the country who have grown a few kinds of root and garden seeds for many years, demonstrates beyond any reasonable doubt, that the necessity for importing our supplies of field root and garden seeds is not because they cannot be grown to perfection in many localities in Canada. France was formerly said to be the seed garden of the world. During recent years Germany and Scandinavia have made rapid progress in the seed growing industry, and perhaps because the climatic conditions of central Germany and Denmark more nearly approach those in Canada, we have been getting a lesser proportion of our seeds from France than we did a quarter of a century ago.

In the production of field root and garden seeds, a great deal of skilled labour under the direction of competent technical experts in plant and seed selection is required. An abundance of such labour is available in Europe at 50 cents per diem or less; the work entailed in seed growing is considered to be an ideal occupation for women in the principal seed growing countries. Having an abundance of labour experienced in the work of seed growing, is really the greatest factor to be considered. The cheapness of skilled labour in Europe is almost, if not quite neutralized, from the view point of the Canadian seed grower, by the cost of transportation and the relative cheapness of land.

GERMINIBILITY.

Field root and garden seeds of good quality should give strong germination, be true to kind, and have had careful breeding and selection.

Investigations conducted from 1902 to 1908 showed that partial crop failures were comparatively common because of the unwitting use by farmers and gardeners of root and vegetable seeds of very low peccentage vitality. Three years ago Parliament inserted a clause in the Seed Control Act that nas been reasonably effective in correcting this source of danger.

(Continued on page 554)

The New Superintendent of the Nappan Experimental Farm.

W. W. Baird, B. S. A., the new Superintendent of the Dominion Experimental Farm, Nappan, N. S., was born and brought up on his father's farm in Cumberland Co., N. S.

He graduated from McDonald College of McGill University in 1912. During his college career he spent a number of summers working in the various departments of the college. He spent one summer in a nursery at Rouginol and two summers working for the Commission of Conservation in the province of Quebec. He also did considerable work in judging standing field crops in the province of Quebec.

He also took an active part in college organizations and at the same time filled prominent positions in the various athletic meets and sports.

After graduating from McDonald College he accepted the position of Superintendent of Sir William Van Horne's Estate, Coven Hoven, at Minister's Island, N. B. which position he resigned to take the position which he now holds.

Mr. Baird is a young men's man and like his predecessor, Mr. Robertson, will do his utmost for the cause which he represents and on which he will strive to throw additional light by the results of carefully conducted experiments.

W. W. Baird, B. S. A.
Supt. Experimental Farm, Nappan, N. S.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

PREPARATION OF THE SOIL.

A thorough preparation of the soil is one of the chief factors in successful management of the soil. As a practical farmer put it at a farmers' meeting'—"Soils that are badly run down by continuous cropping may be restored to their original state of productiveness by the use of fertilizers, but the cause of small returns is not always due to a lack of fertility. Many conditions may prevail which prevent the plant attaining a healthy development. Better conditions, obtained by drainage, liming, &c., may be necessary before the plant can avail itself of further additions of plant food. The more perfect the condition of the soil is made, the better will plants be able to attain the highest development; there will, then, be greater conversion of food into crops. Our soils are the medium in which we can at pleasure convert potash, phosphoric acid, nitrogen into crops; therefore, it is not advisable to keep the medium in the highest state of efficiency? Feed your crops as you do your animals, not merely to appease hunger, but that the highest returns may be obtained. Give them a rich, palatable, well-balanced ration that they will readily take, and be, in consequence, invigorated and developed.

CO-OPERATION.

We hear and read so much about co-operation nowadays that we sometimes wonder if it isn't a waste of time to mention the subject. However, if we judge the amount of discussion which the subject receives by what it deserves we would say that it will be a long time before it receives its just share of attention.

A man who has had years of experience in co-operative work said recently in a speech that the business of farming offers more opportunity for its successful operation than any other occupation or business. From the success which the movemnet has attained in Denmark and other foreign countries and even in certain places here in this country, we believe that this man has hit the nail on the head.

Farmers,get together and organize co-operative associations for doing your work and transacting your business. When once started by all means stick together and you will have an institution with the strength of Gibraltar which will make the Trusts look like drops of water in the Gulf of Mexico.

ASTRAY NOTICE.

"Strayed from my place, one roan heifer with star in face, etc, etc.—Reward for return."

Did you ever read a similar notice in the local paper? Of course you have. It has been a horse, cow, pig, or other domestic animal that has taken the liberty to wander from the home yard—and what a fuss it creates. All the folks of the household hunt far and near. Every neighbor in the country is asked to keep an eye open for the stray. You finally see the above notice in the paper—

Well, what of it? O, nothing much. It is natural that a man should want his property back. Natural that all should worry lest the animal should not fare well away from the tender care of home, worry lest the wanderer should be doing mischief somewhere and the damages charged to the owner.

But we don't care about that. What we are most concerned in is the strays that receive no astray notice whatever—no one goes out to hunt for them and bring them back—the stray boys and girls that become dissatisfied with the humdrum life on the farm and strike out to see the world.

Parents, where are the boys and girls? Are they all safe—every one? Or is one like the prodigal son out in the wide world somewhere? Maybe a cross word, a quarrel, or just lack of paternal interest in him has caused him to cast his lot with the outside world.

All work and no play may be the cause of many a boy or girl leaving the farm. Or perhaps a too tight rein was kept on him at an age when manhood was asserting itself—or no doubt not rein enough to influence and guide one whose tendency was towards waywardness. As Uith colts so with boys and girls, there's a happy medium between over-strictness in training and a woeful lack of discipline at the proper age.

At every revival meeting mothers come to the evangelist and ask his aid in the saving of a wayward son or daughter. What would the anxious mother not gladly give for the return to righteousness of that one?

Estray! Almost as heartrending a word as Lost! A little more hope in it, that's all. Estray—how about the boys and girls that are safe at home? Good boys and girls with no waywardness in them. But do you take them into partnership and help them to become interested in your work or are they secretly thinking of a life in the city—their thoughts and ambitions going astray?

How about the schooling they are getting? Has that a tendency to make your boys and girls stray from the farm in after life? One may be going astray in his secret plans long before father or mother dreams of the truth. One may be best suited for agricultural pursuits yet the mind straying off to the green-looking fields of city clerkships. Whose fault is it? Can you not tack on many a country school this notice—Strayed—a school system that fulfills the requirements of country life. Strayed with it many an ambitious boy and girl who had no fitness for city life.

Be as anxious over the occupants of your homes as you are over the animals within your barn yards. Make as great effort to prevent their going astray and search as diligently for their restoration should it come to pass.

WASTEFUL SHABBINESS.

One can tell the difference in personal character by looking at the houses and other buildings owned by differet men. The thrifty self-respecting man keeps his buildings in repair and well-painted; the thriftless, happy-go-lucky man makes his repairs after a rain has come through his roof and spoiled his hay and loosened the paper on his ceilings, he reapints after his lumber has rotted so that the nails begin to let go.

In painting, the old saying that "an ounce of prevention is worth a pound of cure," applies with peculiar force. There is no form of wastefulness more absolute that the sparing of paint that produces chronically shabby buildings. Every dollar injudiciously saved in paint means many dollars lost in lumber and carpenter work. And this form of waste is so inexcusable! Paint is to-day so good, so cheap and so convenient that a man must deliberately prefer shabbiness to neatness if he fails to use it when needed.

Ready mixed paint intelligently designed for beauty, durability and economy, in almost endless variety of tint and size of can, is found in every stocked village store. You choose your colors and the painter puts them on. This is brings the painting problem down to its simplest terms; but like all the simple conveniences of modern civilization, that gallon can of ready mixed paint has behind it a pedigree of which royalty might be proud; celebrated chemists have labored to produce its pigments; engineers and inventors have designed and perfected the machinery that made, canned and labeled it; competent artists have designed its label and the color cards that accompany it, and a thousand women in mine, laboratory and factory have labored to bring together its constituents and to perfect it.

Now, more than ever before shabbiness in the matter of paint is wasteful, because lumber is becoming ever scarcer, dearer and poorer, while paint is becoming always better, more plentiful and relatively cheaper.

RESPECT WHAT YOU DO.

Never depreciate the importance of your vocation. If you are a farmer and are talking with a senate or a governor, do not say' "I am only a plain farmer and have not had much experience." Donot apologize for it, and tell him that if you had had a chance to go to college, as other boys had, you would not have remained on the farm. You would have done something worth while.

Your business is just as important as his. No matter how high a position the man holds, make him feel by the superb way in which you do your work and by your manly bearing that you have made a profession of farming, that you have lifted it into great dignity by your scientific methods, that you have mixed brains with the soil.

You may be sure that there is always some lack, some weakness in people who are always depreciating the importance of their work. These are the earmarks which show that a man is an artisan instead of an artist in his line—that he has not made the most of it.

Every man should have a superb pride in his voaction. It should be something which he loves to dwell upon, always a subject of absorbing interest to him, because it is really a part of himself. The atmosphere which surrounds his vocation indicates what is in himself. His business or profession is but his self-expression. There is an air of refinement or coarseness, of harmony or discord, of order or system, or slovenliness and slipshodness, a quality of honesty and square dealing, or of trickery and fraud, just according to the quality of his ideal which he has worked out in his specialty.

BEST CROP ON THE FARM.

The boys and girls of the farm interested in farm life and agriculture mean more to the country than profitable crops of wheat, oats and live stock. If the young peoule are interested in farm life it means they will take charge of the work of the farm and become useful and valuable citizens. They have no desire to move to town and lose themselves in the city. They recognize the beautiful side as well as the profitable side of farm life. Too much attention cannot be given to the boys and girls. They should be made partners with mother and father, and their every question relative to plant and animal life answered. In this way they will see deeper than the surface, and will take pride in the work they are doing.

WILL STAND BY THE FARMERS.

"It is the duty of the Government to serve the interests of the man who goes on the land in this province and brings up a family and lives and dies here, rather than the man from the United States who rushes through the province in a day or two on an automobile trip. I stand for the man on the farm who is trying to bring up his family and upbuild our country." The Maritime Farmer concurrs heartily with Premier Flemming on the above mentioned policy embodied in his reply to the good roads Association delegates before a recent meeting of the Executive Council in Fredericton.

For the farmer who will milk 20 good cows, produce the feed on the farm and do the work himself, there is good money in the farm dairy. In this business the farmer sells his own produce to himself, employs himself and his family at good wages to do the work, and removes little fertility from the farm.

The Need of Cheaper Money for Farmers

Editor Maritime Farmer:—

Farming is said to be now the only "one man" industry left, almost all others having been brought under some order of consolidation. At the present time we hear the gospel of intensive farming preached in every farming district, which is well and good providing we have a convenient home market to consume the products.

But it is my opinion that the future will see larger instead of smaller holdings, as the present system on the one hundred acre farm is much too costly to operate.

I have often thought that if ten one hundred acre farms were brought under the direction of a capable, hustling superintendent, with only the one set of machinery and buildings to keep in repair, that this large farm could be made to earn each of the ten families a better living or salary than is possible under the present system of ten separate expensive plants.

The cost of necessary machinery on a one hundred acre farm is about half the cost of what would be necessary to work a one thousand acre plant.

This is where most of the profit in Maritime farming is going. Each machine is used in season for only a few days work. We must have them but they are expensive and hired help is still more costly and uncertain. These machines could be made to do much longer service each season. rust out as fast as they wear out, anyway.

Joint ownership could help rem this trouble to a certain extent, if we could all use the other fellow the way we are sure he should use us. But as human nature is now constituted the other fellow is always trying to impose on us, and few farmers have any satisfaction with a jointly owned machine.

The question is often asked, why is it that farmers cannot afford to pay the wages paid by manufacturing industries for their help to say nothing of giving as short hours? I sometimes think it may be partly because farming has not kept pace in improved and progressive methods with the other industries. A man doing business in town is forced to make his business pay or quit. He has to do as his most enterprising competitors do and is ever watchful for any improved method, in his business, whereas, a farmer occupying cheap land can grub and grumble along on very little. His wants are often few, and if he is not naturally ambitious and enterprising there is nothing to stir him to make any extra effort to improve his condition.

Many men can work better for another man than for themselves and a small percent. would make real good foremen. You can readily see the difference between the men who push their work and those whose work is always driving them. One does every thing at the proper time the other is always wondering what he can put off longest.

It is easy for enthusiasm to overbalance good judgment and as the slang phrase goes, "bite off more than we can chew." This is a mistake often made by young enterprising farmers, but many more entirely underestimate what is possible for them under their particular circumstances, to accomplish.

In a northern climate, such as ours, with a short growing season we must of necessity hustle our work and plan carefully to do everything possible during the winter season. If we are stock raisers we can plan our work so as to grow one crop in summer and manufacture it in winter, and have everything possible in readiness at the first opening of spring so as to take full advantage of every hour. It has been my experience that, usually, most of our crops are not sown or planted quite early enough for the heaviest growth. We can also err in this respect, but usually crops are sown a little too late.

There are many jobs, such as getting the year's supply of fire wood ready for the stove, cleaning and grading seed, making any necessary repairs to machinery, cleaning harness, and doing all hauling possible. In many cases it is only laziness that causes farmers to leave such work undone until spring or summer. Nothing disgusts me more than to see two able-bodied men in mid-summer on a crosscut saw working up wood for the stove as they use it. That is enough to show how the rest of their work is handled. Thrift is a virtue that should be cultivated. We often hear men loafing around a village in winter say that they have nothing to do at home. Perhaps they haven't but it would certainly pay them to arrange matters so they would be kept busy. If it ever paid in the past to occupy Maritime farm lands, properly farmed, it must pay now when such greatly advanced prices are obtainable.

It is said of farmers that they are the only men who do not arise to meet the increased demand for their products. If any manufacturer finds the demand for his goods increasing he invariably tries to increase his output by increasing his working capital and employing more labor. But although there is an advance in almost every article grown or raised on the farm we find very little effort on the part of the majority of farmers to increase their prodution above what they can do single handed. A great cry is raised in the land over the scarcity of farm help, yet hundreds leave our country every season in search of work. Many of these would not work on farms, it is true, but the majority would if the wages were in proportion to the work and if steady work were guaranteed for the entire year. Twenty dollars, at most, in summer, and no job at all in winter will not hold young men here. As far as I can see farm help is sufficiently plentiful in this Province, what is scarce is the money to pay for it. I think every farmer on one hundred acres should feel it a duty to himself and his province to so handle his farm that he can employ at least one man with family during the entire year. Even if he cannot make any more clear money for himself than when working single handed.

The farm lands of the Maritime provinces do not carry the population they should. Our conditions are much more favorable than many countries that support ten times our population.

Our governemnts, both Federal and Local seem to be endeavouring to do everything possible to stimulate agricultural production. The latest announcement being for an expenditure of $1,000,000 a year for this purpose. In just what manner the money will be spent we are not yet acquainted; but with all the short courses and long courses, lectures, demonstrations and instructions of one kind and another which are being fairly driven into the farming population one would imagine that about every farmer had more instruction now than he could absorb or, at least, are not yet burdened with an over supply of knowledge of our business.

Much of the labor of the poor is lost for want of knowledge is a statement found in proverbs or some other part of the good book, I can't remember which. Anyway, it is pretty true and applicable even to this enlightened day.

I would like to see some system of cheap loans for farmers put in operation. I think this would benefit agriculture more at the present time than anything the Government could do. The poorer sections of the country would benefit most as they now must pay excessive interest on all they purchase. Many farmers will pay almost any price for an article on hire rather than borrow money on interest from the bank although they could often save greatly by doing so, as everything bought on time is paid for at a high rate of interest.

I think if a system could be worked out so a farmer could secure money at the lowest possible rate of interest and make all payments on the instalment method it would probably be the best plan as it always stimulates men to meet purchases and is a check on further investments while payment is pending. A payment of this nature is often met with money that otherwise would not be saved at all, in the same manner as the money often put aside to meet a payment on an endowment policy and which is usually the means of teaching men to lay something aside for future use. Those loans could be advanced by the Commissioner of Agriculture or his Secretary, who should be capable of advising the recipient as to the disposal of the money or the necessity of making any loan and he could always be as well secured as is required for any other credit loan. With this assistance many improvements could be made that would greatly increase the production of farms, that cannot now be undertaken for want of capital. Cheap loans and co-operation in buying and selling are now the two greatest needs of the majority of Maritime farmers. Some favored sections are working co-operation out for themselves but usually this is almost impossible.

I have been told by one who studied the Danish system of co-operation that to co-operation alone the Danes owe their success, as farmers and statesmen. They have not prospered in other parts of the world, where they have emigrated better than any other class, individually the Dane is not a wonderful agriculturist. It is their good co-operative business, along with their natural industry that is responsible for their success.

It seems hard to get Maritime farmers to practice co-operation to any extent. Only in the dairy industry has it been attempted in this province and in this it has proved a great success. Co-operation could be greatly extended, and the departments of agriculture have a great field for labor in this respect.—W. M. Lea.

What is the Soil?

Editor Maritime Farmer—

Many forces have been at work in the unknown past in the breaking up of the road and the making of the soil as we have it, principal amongst those are water and air. Weathering is the great agent in accomplishing this work. Rain, snow, frost, ice have broken down the rocks and worn away the mountains leaving the fragments in the valleys. The passing of the iceberg over the rocks during the glacier period ground the rocks into powder which forms the basis of the soil of today.

Much of the fertile soil of the western prairie is the result of the weathering and washing of the great chain of mountains to the west; much also of eastern Canada is the great erotions of prehistoric times. New Brunswick may be said to be all of this character, slowly but surely the elements are wearing away the rocks and converting them into fertile soil.

Changes of the earth's surface are also brought about by the action of the streams which annually carry millions of tons of the finest soil and deposit it on lower levels. Much of our lowlands, islands and intervales have originally been formed in that way, and, are during every freshet being changed either added to or taken from. We see the rounded hills and knolls in the valleys. These have been formed either by the eddies in streams or by having the surrounding material washed away leaving them often of grotesque appearance.

The rock, ground into powder by the action of glaciers, disintegrated by water, air, frost, etc., forms the basis of all soils. Besides this, however, all productive soils contain organic matter, decayed and decaying remains of plants and animals or what is called humus.

The humus contents of soils is the basis of their ability to grow crops. Many soils are said to be worn out that are only robbed of their humus, on that account becoming hard, dead and unproductive rather than wanting in plant food.

Humus is furnished by the decaying roots, stubble and trash, by green crops turned under and by barn-yard manure.

Land that is under constant crop is rapidly deprived of its humus and will soon fail to produce even under the stimulus of artificial fertilizer.

A short rotation of crops is valuable in furnishing this humus especially if clover and other legumes are included in the rotation.

In applying barn yard manure it is better to apply a light dressing often rather than a heavy coat at longer intervals. Much better is it also, to apply the manure fresh when made rather than allow it to lose much of its value by rotting in the pile. The fact of having that manure decaying in the soil is that there is less waste, and that during its decay it stimulates the soil bacteria to do its work of breaking down the soil and preparing plant food for the plant. The great principle of maintaining and increasing the soil fertility is to have something growing on the soil, and something decaying in the soil at all times. Plants grow to maturity and then pass into decay and in their death and decay make a still larger growth possible.

Let us never forget that the soil contains life. "The soil is no mere dead inert mass; it is a scene of life and activity. This is the new teaching; soil that is inactive is unproductive movements of air and water, actions of heat and evaporation, liferounds of countless organisms bringing about decay and breaking down of plants and soil particles. Those are some of the activities of the fertile soil. Did we possess hearing of sufficient delicacy we could hear the thread of the workers. The beating of their hammers breaking down the soil particles, the roll of the tiny machinery. All things begin with the soil and at last all things come back to it."

"The soil is the cemetery of ages, and the resurrectian of life."—Andrew Elliott, Woodstock, N. B.

WHY HE WAS LATE.

"What made you so late?"

"I met Smithson."

"Well that is no reason why you should be an hour late getting home to supper."

"I know, but I asked him how he was feeling, and he insisted on telling me about his stomach trouble."

"Did you tell him to take Chamberlaio's Tablets?"

"Sure, that is what he needs." Sold by all dealers.

HORTICULTURE.

Bitter Pit or Fruit Pit of Apples.

A number of inquiries have again been received regarding this trouble, an account of which was given in the report for last year. While not nearly of the same importance in Canada as in some other countries, for instance in South Afcica and Australia it is of special interest from the fact that, notwithstanding a great deal of attention having been given to its study, it has so far received no satisfactory explanation. In Australia it has been considered of so much moment that Mr. D. McAlpine, the leading Australian plant pathologist, has been commissioned by the Commonwealth Government to devote himself entirely to the study of this disease at a salary of $10,000 per annum for a period of years or until a solution is found.

During the past year also two important papers have been published by Australian investigators which record the results of experiments undertaken to demonstrate that the cause of the disease is to be found in the poisoning of certain cells of the fruit by absorbed mineral poisons.

In the first of these papers, by Dr. Jean White, it is shown that spots quite similar to the more superficial ones of bitter pit can readily be produced by rubbing the sarface of mature apples with such substances as chloroform, corrosive sublimate and arsenate of lead. It is suggested therefore, that under orchard conditions 'pitting' is probably due to local poisoning following the entrance of some of the spray material through the lenticels of the fruit.

Bitter Pit or Fruit Pit of Apples.

In the second paper Prof. Ewart, of Melbourne University, shows that the pulp cells of the apple fruit are more sensitive to certain poisons than 'any other known organisms;' corrosive sublimate for example being toxic in any solution of greater concentration than 1 in 10,000,000,000. At the same time, the uninjured curicle and bloom are remarkably impermeable to such solutions. Young apples were found to be more readily penetrated by dissolved poisons than old ones, but, on the other hand, their pulp cells are more resistant, so that an apple at this stage may absorb a quantity of poison insufficient to cause immediate injury but yet capable of killing a group of cells as the apple reaches maturity. This is suggested as one possible cause of the deep seated spots, but it is also believed that in this case, as also where bitter pit occurs in unsprayed orchards; sufficient poison may be absorbed by the roots and circulated in the sap to cause the death of the fruit cells. While the results of these recent investigations do not furnish all the data necessary in making specific recommendations for the control of the trouble, the advisability of adding enough lime to spray mixtures, whether fungicides or insecticides, to reduce the soluble compounds to a minimum is emphasized. Aside from this particular factor, if it be really the case that the affection may result from the absorption of naturally occurring mineral compounds in the soil control may still remain difficult or impossible, and further work along this line will be awaited with much interest by plant pathologists. —Dominion Rept.

Mr. S. B. Chute Testifies.

The methods and advantages of co-operative selling as practised by the fruit sellers of the Annapolis Valley were explained to the Standing Committee on Agriculture by S. B. Chute, of Berwick, N. S., president of the United Fruit Companies of Nova Scotia. Mr. Chute claimed for the system that it eliminated all unnecessary expenses and gave the producer and the consumer full value. Forty to eighty members constituted a local company and put in all their product, all sales being made through the central office of the Association.

The apples were packed in packing houses in three grades, the prices for Gravensteins running from $2.07 for number one to $1.73 for the second grade and 80 cents for the third. As it cost a dollar a barrel to raise these apples, Mr. Chute said that the third grade was sold at a loss. He told the committee that the Nova Scotia growers were badly treated by the railways as to rates, cars and the inability to obtain clean bills of lading. Even with the co-operative system, said Mr. Chute, there were two middlemen who handled the fruit. The grower in Nova Scotia got a fair price, but the price paid by the consumer was enormous.

As to markets he thought the Western Canadian the best, though the cost of carrying was $1.24, as against 90 cents to England. The fruit was laid down in Winnipeg at $3.24.

Mr. Chute said only about three per cent of Nova Scotia apples went West; 80 per cent went to Great Britain. Two years ago 200,000 barrels went to Germany, and it was a most satisfactory trade. Apples were sent from Nova Scotia even to South Africa.

Mr. Chute said ordinary apple pickers were paid $1.50 a day; barrels cost 25 to 28 cents each. This figure surprised Ontario members, who instanced that in their province barrels cost 45 cents each.

"Why, I bought barrel stock in Ontario and brought in coopers and made up barrels at forty cents," said Mr. Chute. He said that scarcely any apples are shipped from Nova Scotia to the New England market. "They have a surplus of apples themselves," he said.

Cheap wages, young orchards and a low rate to the steamship, 17 cents a barrel, were advantages the Nova Scotia growers have over Ontario growers, according to Mr. Chute. In the past the Nova Scotia barrel has been 130 pounds of fruit but he thought there should be uniformity of boxes and barrels, and the Nova Scotia growers were adopting the Ontario barrel, which is larger in size.

The importance of culling and the shipping of No. 3 grade apples was emphasized by several members of the committee. Mr. Chute agreed Grade 3 apples should not be shipped, he said. Hon Mr. Burrell thought that in the long run No. 3 should be left at home, and as few as possible of No. 2 shipped. The opinion was expressed that shipments of poor apples were ruining the market for the Canadian product.

Cost of Caring for Orchards.

In the management of a farm which is run primarily for experimental purposes and as a laboratory adjunct to the Maine experiment station it is obviously impossible to keep in dollars and cents the cost of operation of any one line of work and the profit or loss arising therefrom. In selecting the cost of handling a single item money values are likely to be misleading. If only the time actually used by the men and the teams upon special lines of work is charged up it will be found at the end of the year that there are very considerable items of cost that have not been charged to any department, but are borne by the farm as a whole Furthermore, it is not possible to estimate how much of the salary of the director and his associates in scientific work should be charged up against the management of the place.

There are times in the year when it is necessary in the management of Highmoor Farm to have quite a large crew. Obviously they cannot be employed merely at the time when they are wanted for orchard or other special work, but work has to be found for them at other times that is not directly profitable. How much of that time and labor should be charged against orchard management no one can figure. It is possible, however, to give pretty clearly the cost of the management of the orchard in hours of labor, pounds of fertilizer and spraying materials, etc., for the trees that are in solid blocks. Obviously, the cost of management of the trees not in solid blocks is greater than that here named. It costs as much to cultivate an acre that has a few trees as one that is fully set.

Outside of the orchards that are run for special experimental purpose, the orchards are plowed as early as possible in the spring, are cultivated about five times, are pruned, are sprayed three times for insects, and fungi, are carefully looked over for insect enemies such as borers, and at the last cultivation are seeded with rye for a cover crop.

One-half ton of fertilizer carrying 4 p. c. nitrogen (one-third of which is from nitrate of soda and the other two-thirds from high-grade organic matter), 8 p. c. available phosphoric acid, and 7 p. c. of potash soluble in water are used per acre. One man and a pair of horses will apply this in one hour.

In plowing two men and one pair of horses will plow three acres of 69 trees each in a day's time. A pair of horses and one man will harrow six acres a day. With the tractor engine and two men we have harrowed 18 acres in one day, doing far better work than is possible with horses.

The trees were sprayed three times in 1912 with lime-sulphur and arsennate of lead. The lime-sulphur used was made by the Geneva formula. Owing to the size of the cooking vessel 20 pounds of quicklime, 40 pounds of sulphur and 25 gallons of water were used for each batch. The lime was slaked in the kettle. The sulphur was made into paste, with a little of the water and then together with the remainder of the water was added to the lime in the kettle. This was boiled for about three-quarters of an hour, allowed to settle and the clear amber-colored lime-sulphur solution of a strength of about 24 p. cl Baume was decanted. To make this 25 gallons of concentrated lime-sulphur takes one man about two hours. Four gallons of this strong lime-sulphur solution added to 96 gallons of water make the dilute lime-sulphur as used in spraying. To this is added three pounds arsenate lead paste, or 1½ pounds of dry arsenate of lead powder. One batch of the strong lime-sulphur will make about 600 gallons dilute lime-sulphur.

The cost per acre for the care of orchards, exclusive of pruning, fighting borers and harvesting the fruit, is summed up as follows: One-half ton fertilizer, 10 pounds quicklime, 20 pounds sulphur, 1½ quarts gasoline, one bushel rye, 15 hours of a pair of horses, and 23 hours' labor of a man. The yield of apples in 1912 was 2950 barrels of No. 1 and fancy fruit from less than 2300 trees or about 90 barrels per acre. There were practically no No. 2 apples and about 100 barrels cider apples.—C. D. Woods, in Maine Farmer.

Goosberries.

The second earliest fruit ready for market is the gooseberry. It is principally a pie fruit and is usually preserved for such purposes. Its market is more limited than that for the strawberry, but it is not nearly as perishable and can be picked and used at various stages of maturity. At present the demand does not equal the supply. More of this fruit is being commercially preserved every year and this use should take care of an increasing supply for many years. However, due to the high price of plants comparatively few gooseberry plantations have been planted during the past few years.

The care of the gooseberry is not as exacting as the strawberry, but good care pays and the profits are good, sometimes being as high as several hundred dollars per acre. A well drained, moderately rich soil or one that will grow good corn will be suitable for gooseberries. The location should be sunny and there must be a good circulation of air on account of the susceptibility of the fruit and foliage to a fungous disease known as the mildew. The ground should be well fitted and fertilized before the plants are set out. But fertilizer can be applied more easily to gooseberries after the plants are set than can be done with strawberries.

PLANTS AND PLANTING.

Two year old plants are generally planted and usually sold by the nurserymen but one year old plants that have made a good strong growth will do. The plants are usually set in rows six feet apart and four feet in the row. If the roots are very long, it is advisable to trim them back slightly. The plants should be set slightly deeper than they were in the nursery, especially on a light soil and the roots spread out as much as pos-

sible and then the soil firmed about them.

CULTIVATION.

The cultivation of gooseberry plants should be thorough and started early in the spring and continued until about the first of August when a cover crop, preferably oats, should be sown. An application of well rotted stable manure before cultivation starts will undoubtedly pay well and this might be supplemented with an application of one hundred to two hundred pounds of muriate of potash and two hundred to five hundred pounds of acid phosphate per acre.

PRUNING.

The pruning of the gooseberry plant is important. When the plants are set the tops should be cut back slightly and the bush balanced up as much as possible. A good bush should have about six bearing canes. The tops of each cane should be cut back slightly each year and the season's growth cut back a little, depending upon the growth made. The young shoots not needed should be cut out every year. A few of the stronger ones should be left to replace the older bearing canes. The gooseberry bears its best fruit on canes from two to four years old and by leaving one or two of the stronger young shoots each year and cutting out one or two of the old ones, the bearing wood can be kept in the best condition.

In pruning it is highly important ling of a European variety. It is vigorous, productive and hardy. The fruit is pale green, smooth and attractive, nearly as large as that of the Chautauqua and probably averages about half way between the Downing and the Chautauqua. It is practically as free from mildew as the American varieties.

RAISING PLANTS.

Gooseberry plants are not difficult to raise by the following method:

$10,000 Apple Farm, $6500.
Last year's Income $2322.

115 acres; one of the finest farm houses in the Annapolis Valley, overlooking Minas Basin; only 1 mile to depot and best village advantages; 85 broad acres in rich machine-worked fields; brook-watered pasture for 14 head; splendid 9-room house; barn ties up 18 head stock; stable and piggery; aged owner cannot wait to secure full price for this property; his affairs must be settled immediately; if taken now price is only $6500, part cash; for traveling instructions to see this and a 220-acre farm for only $3200, see page 57, our "New Mammoth Farm Catalogue No. 36," just out; beautifully illustrated and filled with a wonderful assortment of money-making farms; send today for your free copy, it will save you lots of time and money. Box D., Sussex, N. B.

to keep on the lookout for the cane borer which is a little worm that bores in the centre or pith of the cane. This worm almost always works downward. A cane with a black centre and somewhat hollow indicates the work of the borer and such a cane should be cut back until the sound healthy pith is reached.

CONTROLLING INSECTS AND DISEASES.

Gooseberry bushes should be frequently inspected for San Jose scale or the European fruit scale, especially in localities where these insects are known to be common. They can be destroyed by spraying the bushes early in the spring before growth starts with the strong lime sulphur.

The mildew (a common and serious fungus disease especially on the English varieties) and leaf spot diseases and "worms" can be controlled with the dilute lime sulphur or bordeaux to which is added 2 pounds of arsenate of lead to every 50 gallons. Make the first spraying just as the leaves are expanding and again when the fruit is about one-fourth grown.

If the mildew is serious or the varieties are English use the dilute lime sulphur without arsenate of lead every 10 or 12 days.

If worms are found after the fruit is one-fourth grown poison them with pyrethrum or hellebore.

Leaf bugs or aphids may appear. When they do spray with nicotine or strong tobacco water while the bugs are red and wingless and before the leaves have become curled.

When pruning, if a cane is cut that shows discolored pith, it may indicate the cane borer. Cut back to sound pith. Burn trimmings.

Wilted foliage at any time indicates the cane borer. Cut out and burn.

VARIETIES.

The following American varieties have been found to be comparatively free from the mildew:

Downing is the most valuable variety grown for commercial purposes. It is vigorous and productive. The fruit is of good size and of yellowish green color. It will not stand neglect as well as some other varieties.

Houghton is second in value on account of its vigor, freedom from disease and ability to withstand lack of care. Its growth is more slender and spreading than that of the Downing. It is very productive but the fruit is not as large nor as attractive as that of the Downing.

Red Jacket and Pearl are two varieties quite commonly planted. Red Jacket is vigorous and prolific, its berries are good sized and red when ripe. The Pearl is a cross between the Downing and English variety, and so nearly like the Downing that it is difficult to distinguish between them.

The English varieties are not grown very extensively in this country on account of their extreme susceptibility to mildew. They are often shy bearers, but the fruit of most of the varieties is large and of attractive appearance. Where there is a market for fancy gooseberries they will bring a good price. The following varieties are considered the best.

Chautauqua.— The bush is vigorous and productive, fruit very large, pale green in color and of high quality. Valuable for home use.

Columbus.—Bush vigorous, fruit somewhat like that of the Chautauqua. It is not as susceptible to mildew as some of the other varieties.

Industry.—Bush vigorous, most productive of the English varieties. Fruit is very large and dark red when ripe and quite hairy. One of the best English sorts, although the reddish color is somewhat against it.

Portage is one of the newer varieties. It is an American raised seed-

Can you arrange the above sets of jumbled letters into the names of eight well known fruits. If so, YOU CAN SHARE IN THE DISTRIBUTION OF THE ABOVE PRIZE. It is no easy task, but by patience and perseverence you can probably make out 5 or 6 of them. To the person who can make out the largest number we will give the Sum of One Hundred Dollars. To the person making out the second largest number the sum of Fifty Dollars. To the person making the third largest number the sum of Thirty Dollars. To the person making the fourth largest number the sum of Twenty Dollars. Should two persons send answers equally correct, the first two prizes will be divided between them, (each receiving $75.00) Should three send in equally correct answers, the first three prizes will have to be divided, (each receiving $60.00). Should four persons send equally correct answers, the whole sum of $200.00 will be equally divided (each receiving $50.00), and so on in like proportions, provided they comply with a simple condition about which we will write as soon as answers are received. WE DO NOT WANT A CENT OF YOUR MONEY WHEN YOU ANSWER THIS ADVERTISEMENT. If you can make out anything like a complete list, write us at once enclosing 2-cent stamp for our reply. DO NOT DELAY. WRITE AT ONCE. Address, CANADIAN MEDICINE CO., Dept. 81 MONTREAL, QUE.

Make cuttings of the past season's wood, either in fall or early spring, about eight inches long and of well ripened wood. If cut in the fall, they are most easily handled by tying them in bundles, labeling and packing them in damp sand or moss in a cool cellar. Early in spring, they should be planted in nursery rows, leaving two buds above the ground. It is essential to get the cuttings planted before the growth starts and good cultivation should be given them during the season.

ROCKVIEW FARM, THE HOME OF CLASSY HOLSTEINS

W. S. HARDING, PROPRIETOR, WELSFORD, N. B.

Among the coming young men of New Brunswick who are accomplishing results on the farm is our young friend, W. S. Harding, of Rockview Farm, Welsford, N. B.

Mr. Harding moved from the old homestead Wish-ton-Wish Farm, which is located about four miles from his present holdings which he purchased from Mr. Jas. Corkle in the spring of 1913.

At the time of purchase five scrub cows were thrown in with the farm and immediately he began to grade up his small herd by the use of a pure bred Jersey sire. In a few short years the heifers produced by this mating were averaging over 300 pounds butter fat per year. One cow gave over 10,000 milk, testing 4.78 per cent. fat in one year. Truly this record should be an incentive for young men wno are working away with very ordinary cows to turn their attention to the possibilities that lie in store for the person who pays proper attention to the grading up of their herds by the judicious use of a pure bred sire.

Noticing the heavy demand for pure bred Holsteins and believing that there was a bright future in store for breeders of the Black and Whites as the demand was likely to continue for some time, Ms. Harding decided to try his luck at the business.

With that purpose in view, Mr.Harding purchased in March 1911, the heifer calf, Gay Lad's Minnie Rooker, from Harding Bros. In June of that year he went to Ontario and bought a three-year-old cow from R. F. Hicks, Newton Brook, and a senior yearling heifer from A. E. Hulet, Norwich. The followinb January he again visited the Tillsonburg sale in Ontario, and there purchased four more head.

A Maritime Farmer representative visited Rockview Farm last February and had the pleasure of seeing the trim little herd in its home quarters.

Although the Rockview herd has only been founded during the last two years, as already stated, when one who is conversant with Holstein qualities enters the stable he perforce sits up and takes notice, for there he finds more gilt edge quality than he would naturally look for.

It was a bright balmy day and as the herd was turned out to water and for a little exercise in the open air we viewed them one by one.

Netherland Sarcastic Girl, now five years old, the cow purchased from R. F. Hicks for $300 is of the low set type and is a grand daughter of Johanna Rue 4th Lad, a bull with more daughters in the R. O. M. than any bull in Canada. He was a son of Sarcastic Lad, champion bull at the St. Louis Exposition. Netherland Sarcastic Girl is a great milker and has given over 9000 pounds milk since September 1st, 1912. Shortly after her introduction to the Rockview herd she dropped a heifer calf sired by Farforit Posch De Kol, a bull of considerable merit. She dropped another fine heifer calf last August which was recently sold to Harding Bros' fos $157.00.

Next came Fairy Favorite, a daughter of Faforit 5th Gamey, son of Faforit 5th, a cow that made 26 pounds butter in seven days when 26 pound cows were not so numerous as they are today and which was afterwards sold to H. A. Moyer, Syracuse, N. Y. for $1,000. Fairy Faforit is a great breeder. Several of her calves have been sold to British Columbia parties for sums ranging over $400.00 She has a good standing in the record of merit. Delegates to the recent meeting of the New Brunswick Farmers and Dairymen's Association had the opportunity of seeing Fairy Faforit and her ten months old, exceedingly promising heifer calf, in tne ring.

Faforit was bred by R. H. Hicks, who sold her to M. L. Haley, Springford, Ont., who in turn offered her in the Tillsonburg Sale, where she was purchased by Mr. Harding.

Kate Abbekirk, the next in line, is a fine, large, straight, two-year-old that was also purchased at the Tillsonburg Sale. She also is a grand daughter of Johanna Rue 4th Lad and was second as asenior yearling in a class of over twenty at the Toronto Exhibition in 1910. She is by Grace Fayne 2nd Colu...bia. The next calf dropped by her dam was grand champion female at Toronto in 1911 and was afterwards sold to Colony Farm, B. C., for $1,000.00. Kate Abbekirk dropped her first calf when she was but twenty-one months old and is proving a heavy and persistent milker. She has given as high as forty-five pounds milk per day, two milkings. Her bull calf by Haley Bros. famous stock bull, Grace Fayne [illegible] was sold for a good figure to Fowler Bros. the enterprising young farmers of Amherst Point, N. S., in whose hands he will be sure to give a good account of himself.

A Herd of High Grade Jerseys at Pasture.

Scene on the farm of Chas. P. Bull, Northampton, N. B. A splendid example of what may be accomplished by the persistent use of Pure Bred Sires in the Herd.

If You Have Two Or More Cows

it will pay you to use the Standard cream separator instead of skimming cream by the old method. By using the

Standard

you will get **$15.00 more profit** from each cow per year—and this is a low figure. Most dairymen do much better than this with the Standard. You can thus readily see that it takes but a short time for the Standard cream separator to pay for itself. And by taking advantage of our EASY PAYMENT PLAN you can pay for your Standard out of the extra profits it earns for you. You've heard a lot about the Standard It's the separator that has made new world's records for close skimming at experimental farms, cheese and butter factories, and on the farm. Write for folder, entitled "Skimming Results." It gives the proofs. Also ask for our catalog.

Shall I Buy a

SPRAMOTOR

or an ordinary spraying outfit?

That's *the* question—
Your decision should be *determined* by *what* you expect the machine to do and *how long* you expect it to do it.
If you want a *durable* gasoline machine to do all these things in a *bigger* way but *mainly for orchard work* and *white-washing* you want the

Model "C" Spramotor

If you want a *durable* H. P. machine to do all these things besides spraying grain and doing the white-washing you want a

H. P. Spramotor

If you want a durable hand machine for the purpose of destroying weeds—spraying orchards, potatoes and row crops—one that you can also paint with—you want a

Hand Spramotor

The SPRAMOTOR in every class, has *demonstrated* its *superiority* to all other spraying outfits and *there's one built specifically* for your needs.

Prices range from $6.00 to $350.00

N. B.—When you buy a SPRAMOTOR you make a permanent investment because every machine bearing the name is built to endure.

SPRAMOTOR COMPANY

1535 King St. E., London, Can.

WINDSOR DAIRY SALT

Swept The Boards At All The Fairs

1911 was a triumph for Windsor Dairy Salt. Practically every prize for buttermaking was won by someone who used Windsor Dairy Salt.

Those, who make their living out of their dairies, say that Windsor Dairy is their old standby. They always rely on it because they know it is pure—because it makes the richest, most delicious butter — because they win the prizes and get "Top prices" for their butter—when they use WINDSOR DAIRY SALT. 66D

While the World Sleeps EMPIRE

Cream Separator Factory Is Running

Elderly people who read this will think of their first EMPIRES, purchased more than a generation ago —and since replaced with modern EMPIRES.

The recommendation of our old friends is making a vast army of new friends.

Dairying is certain. Wheat and other crops are uncertain. This is turning Canadian farmers to dairying and to EMPIRES.

At night, while the world is sleeping, the EMPIRE factory is kept running to meet the demands of our customers.

Quiet, light running has made EMPIRES world renowned.

While turning a properly cared for EMPIRE at speed, with one hand, you can hold your head close to the EMPIRE, place your watch to your ear with your other hand and hear your watch tick very plainly.

See, try and know our splendid separators.

Catalog 131, and Full Information Sent Promptly On Request.

If You Have Live Stock For Sale Advertise it in the Maritime Farmer.

Daisy Posch Abbekirk, the next to saunter along, is a large three-year-old which was purchased from A. E. Hulet, Norwich, Ont. She was second prize winning calf at Toronto, in 1909. In 1910 she was first in senior yearling class at Halifax, Chatham, Fredericton, and last fall, after being in milk for over a year, she was second at St. John and third at Halifax.

Next to come along were the two large, rugged, two-year-old heifers, Nell's Canary and Lady Tensen Canary, purchased from A. E. Hulet. They are both promising heifers and give indications of being heavy producers when they are fully developed. Lady Tensen Canary is out of the same dam as J. D. Irving's Count Tensen A., champion at St. John and Halifax in 1912.

Gay Lad's Minnie Rooker, now coming two years old is a grand daughter of Logan Bros.' old prize winner, Minnie Rooker. She is a good thrifty youngster and is now springing a finely developed udder.

Netherland Faforit DeKol, the first dropped by Netherland Sarcastic Girl after her arrival on Rockview Farm is now a large white heifer fast approaching maturity.

The choicest plum in the whole collection is the eleven months old Fairy Faforit Grace Fayne Colantha, that was so much admired by the farmers at Fredericton. She is by Haley Bros' Grace Fayne 2nd Colantha and he by Colantha Johanna Lad a son of Sarcastic Lad and out of Grace Fayne 2nd, whose record was

A Carleton County Farmer's Experience With Jerseys.

The accompanying cut is a pastoral scene on the farm of Chas. P. Bull, on the Eastern side of the river, at Northampton, about three miles from Woodstok, Carleton County, N. B. All the cattle shown in the photo were raised on the farm. For several years Mr. Bull had Ayrshires and Shorthorns, but about twenty-five years ago he purchased a pure bred Jersey bull from Mr. C. E. Grosvenor, Meductic, N. B. This bull was of St. Lambert strain. Another bull, a descendent of the Hood Farm, was bought later. Then a Golden Lad bull was purchased from Mr. E. B. Elderkin, Amherst, N. S., and as time went on new blood was introduced until the herd was brought up to what it now is

The cows receive only ordinary care feeding hay, straw and turnips, and some grain in spring before and after freshening. In summer they graze on ordinary pasture. In October last, when the Woodstock Creamery closed down, the herd was making over 100 pounds butter per week on aftergrass feed which was none too luxuriant as on account of the wet season the hay was cut rather late.

The herd tested an average of 4.5 per cent. butterfat in May. The lowest testing cow tested 4 per cent. and the highest 6.3 per cent in the month of August.

Mr. Bull patronizes the Woodstock Creamery from the time it opens in the spring until it closes in the fall. He has private customers that he supplies throughout the winter months. Mr. Bull says the Jersey cow is good enough for him and is a strong advocate of the use of a pure bred sire in the herd. He believes a farmer should select the breed that suits his conditions and fancy the best and having chosen his breed let him stick to it and build up a high-grade herd by the introduction of new blood as often as is necessary to avoid inbreeding.

He has tried this method and he has found it gives good satisfaction.

FREE A BOOK THAT EVERY COW OWNER NEEDS

In this 72-page book has been gathered together a fund of valuable information covering very fully those questions which are of vital interest to every owner of cows.

Some of the subjects interestingly discussed in this book by the best known authorities in America are as follows:

Dairy Cows' Diseases and The Proper Treatment;
Proper Dairy Feeding and Balanced Rations;
Most Suitable Dairy Crops; Alfalfa;
Dairying for Profit; Silos and Silage;
Soil Fertility; Farm Buttermaking, etc.

Illustrations of representative cows of each of the well-known dairy breeds are shown and the special claims for each breed are set forth by the various cattle association secretaries.

The book also contains a series of illustrations showing the desirable points in selecting a dairy cow and much general information of value to dairymen.

While the De Laval Dairy Hand Book covers the various phases of dairy farming most completely it is in no wise technical, but is **written in plain every-day language so that even the children can understand it.**

Free to Cow Owners.

Our factories, produced nearly a quarter of a million Model T's. Prices: Runabout, $675, Touring Car, $750; Town Car, $1,000—f. o. b. Walkerville, Ont., with all equipment. For particulars get "Ford Times"—an interesting automobile magazine. It's free from Walkerville factory. Ford Motor Company of Canada, Limited.

LIVE STOCK.

Ringworm on Cattle.

This disease is known by various names in different districts such as "Tetter," "Scruff," and "Itch." All the domeseic animals are liable to be attacked by it, and it should be noted that it can be transmitted from animals of one species to those of another, and that human beings can take the disease fsom animals. Owing to the fact that death does not usually result from its attack, the disease is too often disregarded when it appears amongst the live stock on a farm, though there is no doubt that much loss in condition and growth result from the presence of this disease among young stock, says a leaflet of the Irish Department of Agriculture.

SYMPTOMS.

The symptoms vary somewhat in the different species of animals; and since there are several forms of the affection, the appearance of the affected parts may vary even in animals of the same species. The most comman form is that met with on young cattle, the disease here showing itself in the form of rough grey "crusts" on the skin of the head and face, sometimes appearing also on other parts of the body and limbs. The "crust" frequently occurs as a patch surrounding one or both eyes. On horses ringworm generally appears as circular patches, at first covered with a grey crust, which after a time may be rubbed off, leaving a smooth bare patch. Other animals usually show much the same symptoms as the horse, but it is well to remember that cats are liable to a form of ringworm on the head which is so severe as to cause their death, and which, if communicated to a human being, may have very serious results.

SPREAD OF THE DISEASE.

The actual cause of ringworm is infection from an animal sufiering from the disease, but the disease is favored by dirt and neglect. It may be carried by brushes and currycombs, and may be contracted by animals rubbing against posts which have been contaminated by affected animals. Horses sometimes become infected by harness which has been worn by an animal suffering with ringworm.

NATURE AND CAUSE.

It must be remembered that this disease is simply an affection of the skin and hair or wool, the "crust" being composed of dried discharge from the skin mixed with dead hair or wool and the fungus which causes the discharge by irritating the skin while growing upon it. This fungus under a very powerful magnifying glass is found to grow in fine threads with small round objects known as spores, which may be called the seeds of the disease and which cause the disease if conveyed by any means to the skin of a healthy animal.

TREATMEET.

Treatment is not usually difficult if the stock owner makes a really determined effort to banish the disease. Owing to the extremely contagious nature of ringworm, it is necessary to take steps for its suppression immediately it is noticed, and this is all the more necessary since human beings when infected with it from animals take the disease in a particularly unpleasant form. The affected animals should be at once separated from healthy ones and confined in a place which can readily be disinfected to prevent further contagion later on. Since the fungus which causes the disease requires air, it is often found sufficient for a cure to smear the affected parts with something which excludes the air. Thus, a simple application of lard or oil frequently repeated is sometimes sufficient to effect a cure; but the owner of animals suffering with ringworm should adopt stronger measures. One of the most useful applications is made by thoroughly mixing half a pound of lard with two ounces of sulphur and four ounces of oil of tar, a small quantity of this mixture being smeared on the patches daily. Any good reliable sheep dip will be found efficacious as a cure, but must be applied daily for a few days, one application being seldom sufficient. A solution of four ounces of sulphite of copper (bluestone) in one part of water may be used if the number of patches is not too great, but care must be taken to prevent this or other irritating fluids from getting into the eyes, and also to avoid using poisonous substances extensively therefore, be kept clean; and ponds where animals are likely to lick themselves or one another. Mercurial ointment is sometimes used with great success, but it must be remembered that cattle are very liable to be poisoned by it. If used it should only be applied about the head and neck moderate quantities, the animal being kept by itself. Whatever dressing is chosen for use, a cure will be hastened if the patches are first thoroughly soaked with hot water in which washing soda has been dissolved in the strength of four ounces to one quart. This softens the crust and allows the remedy to penetrate.

PREVENTION.

The remarks with regard to isolation of affected animals must not be forgotten. All bedding used by them should be burned or otherwise destroyed. Woodwork and walls, etc., against which they may have rubbed should be washed with some strong disinfectant such as crude carbolic acid, one pint to five gallons of water. Currycombs, brushes and harness which may have been contaminated should be treated with this or some other disinfectant. Liberal feeding, with shelter from inclement weather, will assist the animal to resist the inroads of this and other diseases. The walls and fittings of cowhouses and stables should receive a coat of fresh limewash at least once a year, the floors receiving a soaking with a solution of sulphate of copper, five pounds to ten gallons of water. Freshly purchased animals, if exposed to infection at fairs or elsewhere, should, on arrival, be washed with a weak solution of sheep dip.

Ringworm attacks lean, half-starved animals more readily than those well cared for; and since it pays better to keep young animals thriving than to allow them to get into low condition, there is thus a double reason why stock-owners should devote special care to young cattle, particularly calves during their first winter. By doing so they will enhance the reputation and value of their stock, and secure for themselves greater profits. It is a very bad sign when the young stock reared on a farm have to be annually treated for ringworm.

At Lambing Time.

Be sure to to put each ewe in a little pen by herself when she lambs. She will get along better than when other ewes are jostling her and her lamb can not get lost from her. If you need to give her any attention, you can manage her better here than in a larger pen.—Farm, Stock and Home.

International Stock Food
Is Equally Good for Cows—Horses—Pigs

This great tonic is for all live stock—to make cows give more milk—to keep the working horses in prime condition—to fatten pigs and keep the "winter" pigs strong and vigorous.

We guarantee that it will make your colts, calves, pigs, shoats and lambs grow rapidly, and keep them healthy and thriving all the time.

Tell us the number of head of stock you own and we will send you a copy of our $3,000 Stock Book—Free.

Here's another farmer who finds it pays to feed International Stock Food:—

"Rockport, West Co., N.B., Jan. 13, 1913.

"INTERNATIONAL STOCK FOOD is all O.K. I average a package every two months for my stock—having three horses, four cows, two calves, four steers and sheep. Careful tests show that my milking cows have given 50 per cent. more milk since feeding International Stock Food. It is also fine for calves.

This Fence Has Vast Strength

For a fourth less than the price we pay, we could get hard-drawn steel wire. But that kind, though used in most other wire fence, hasn't the *life*, the springiness, the strength we insist on for Maritime Wire Fence.

• • • •

So we make this fence of extra-heavy hard drawn steel wire of nine-gauge. Constantly we test it for quality. And so we *know* this fence has *more* strength than it probably will ever need.

• • • •

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime Fence is far longer—and the fence surely reliable.

• • • • 11

On this extra-quality wire we put a smooth, even heavy coat of galvanizing. We put on more than enough—that's our way. You gain by the longer life of this better fence. And we lock laterals and upright wire rigidly, yet springily, with a cross-leverage lock that simply CANNOT let go under the hardest strain.

• • • •

You can bank on the strength of this fence Make the test for yourself and your neighbors. Then get the agency—it will pay you well. Address

Buying and Caring for a Dairy Bull.

Many a farmer who does not keep pure-bred cattle is considering the question of buying a pure-bred dairy bull, for the purpose of breeding up a better herd of cows. The proposition should be given much thought. These suggestions are based on many years' experience in dairy farming, and observation of the practice of some of the most successful breeders in the country. Dairy farmers want most in their cows capacity for large milk production, or the inherent power to convert food into the maximum quantity of milk or butter-fat. They also need vigor of constitution so far as compatible with symmetery and beauty of form.

The bull's dam should have a large yearly record for milk production. There should also be back of the bull a line of dams having large records. The law of breeding that the male transmits its characteristics to the female, and vice versa, should govern in the selection of animals, and the more high-producing mothers the pedigree of the bull shows, the more dependable is the bull to transmit the qualities of his mother to his progeny.

The mother of a bull we wish to buy, being more accessible, it is desirable to see her that we may judge as to the other qualities we want, namely, vigor and conformation. If we cannot see the cow the next best thing is to see her photograph. If we buy a young bull or calf, we have little else to guide us but the known qualities of its parents.

Next we come to the question as to whether we shall buy a young or mature bull. I put this question to a well-known breeder: "At what age can the farmer with small capital most economically buy a bull?" He answered: "I would say, from six months to one year old. If the calf has good dams back of him, you would expect to get mostly good cows." The breeder referred to stated that he would prefer a strong vigorous calf with a good canformation, but these would be only secondary considerations. He would feed and care for the calf about the same as the heifer calf that he wanted to develop into a good cow. He should have milk until about one year old, with linseed meal, oats and bran, both hay and grain in summer and roots and hay in winter. He should be kept in clean sanitary stalls and sheltered from storms and cold.

I have visited some of the largest breeding farms to learn how they care for and feed the service bull, and they recommend that the farmer's bull should be kept in a concrete paddock where he can exercise at will, but cannot possibly break out. A bull should be kept in the nose. It is a good plan to cut the door of the paddockor stall in halves. Then one can open the upper half and call the bull to him and fasten the staff to the ring in his nose. Have a chain attached to the sihe of the stall and snap it in the ring when working in the stall to clean it. Begin to handle the bull when young and accustom him to being handled, for as one breeder told me a man should "always be larger than the bull." He must never give him any chance to attack one. One must take the safe course with him; he is in no danger at any time. Bulls are more liable to attack one when turned out loose with cows. Generally the bull should never be allowed to run with the cows. A possible exception to this rule is in case of an old bull known to be safe to handle without a staff. If one wishes to maintain the full vitality of the bull, so he will be vigorous in old age, he must keep the bull nearly all the time in the paddock and have serving stalls in the barn.

Try the 40c. package of Red Rose Tea.

Although the 30c. and 35c. qualities are generously good, people who use the 40c. quality believe it to be worth the extra money. It's a stronger, finer-flavored tea. It goes farther in the pot.

N.B.--Coffee users will find Red Rose Coffee as generously good as Red Rose Tea

RED ROSE TEA "is good tea"

MONEY IN POTATOES

$48.00 per acre
OR

$128.00 per acre
WHICH?

When it comes to a difference of $80 an acre on a potato crop, let us take off our hats to the Potato experts.

They can show a practical farmer how to turn an average crop of 120 bushels per acre into a bumper crop of 240 bushels. Simply changing a few old methods of potato growing does it. In this day of high prices, that means $128.00 per acre clear profit instead of $48.00—a difference of $80.00.

The big profit is on the extra bushels because the first cost remains the same.

How experts worked it out through years of experimenting is told in simple words in our little book "Money in Potatoes." A book full of sound ideas—no theory. Every difficulty you could have in potato growing is dealt with.

With this book to refer to you can double your potato crop. Send in the $80.00 coupon for a free copy to-day. 17

Name .....

Address .....

The ration for the herd bull should be about what one would feed a cow for largest milk production—a liberal, fairly well-balaned palatable succulent ration. The only difference in the ration for the bull is that he should have less of the concentrates as cottonseed meal and corn meal, and perhaps more of the succulent laxative foods like silage. He should be fed well, so as to keep him in full vigor and strength, but one must not overfeed him. The average farmer underfeeds the bull. One I know fed his bull only hay and grass and used him on a tread power lor churning, and the vitality of the animal was so low that he was unfit for service. Using the bull a short time on the tread-power every day may economically utilize surplus energy, and the bull will be the better for the exercise, but he should be fed well and not overtired.

The best solution of the problem of economically getting the use of the best bulls is for focal dairy men to organize a combined cow-testing and breeders' association, and jointly own and use the best bull obtainable.—W. H. Jenkins in Breeders' Gazette.

Profits in Early Maturity.

One of the curious things about body cells is, says the breeders' Gazette of Chicago, that they behave differently at different times. During the youth of animals they are as busy as nailers, and as ambitious as beavers; their business is growth and multiplication. They increase by division. The one splits into two, the two into four, the four into eight, and so on indefinitely. In order to multiply, the cells must attract and assimilate food. By grabbing the substance of digested foods that the blood hurries by, by appropriating food elements and then dividing themselves, these cells make growth.

The body cells are unlike and do not act the same way at different stages of animal growth and development. In the baby pig they are young, enthusiastic, hungry, eager, dividing and dividing again; that is, if they have food with which to build. As the age of the animal progresses, they become less active and are careless of increase. As age creeps on they cease to try to propogate at all; the blood may surge by them laden with food, but thet are indifferent; they increase no more. There is money in understanding this simple scientific truth. There is a lesson; it is "feed the babies." That is the stockman's opportunity. Take advantage of young and vigorous cell-growth.

THE HORSE.

Hints for Teamsmen

Those observant men who have had a wide experience in the feeding of horses, know how considerably these animals vary in their appetite and digestive capacity.

To such an extent do they differ, that the food requirements of one horse, to keep him in good condition, would be quite an inadequate ration to maintain another. In any case, it is obviously the wisest procedure to study their individual temperaments, habits, and constitution in order to be able to apportion to each animal the exact amount of grain and fodder necessary for its upkeep, taking into consideration at the same time age and the particular work it is expected to do. It is essential that teamsmen should take into account the ration suitable for a healthy horse when not working and one necessary to supply the requisite energy when working hard.

If the work is extra hard and continuous the ration should be full and concentrated; on the other hand, when at light work, or if standing in the stable, great reductions in the food are possible. This is a most important point indeed, and if we adopted this plan more generally the horses would be far healthier and there would be no "thick legs" on Monday morning. We cannot have a cut-and-dried system in feeding horses.

The skillful teamsman who is proud of his horses, and actively interested in their welfare, will try to put their food before them in a suitable and palatable form. It would be most useful, though, if he possessed a knowledge of the internal structure and anatmony of the horse; he would know then that the horse has a very small stomach in comparison with his bulk, and would see the importance of feeding horses on scientific principles.

The ordinary farm horse will eat of oats 15 to 20 lb. per day and about the same weight of hay. These are the best foods for horses, but farmers find it more economical to use a more mixed diet, such foods as beans, sharps, maize, bran, straw and roots being used. Some horsemen chaff all the hay, but my experience points to the fact that a portion of it is best given in its long state.

Also I believe in having the oats ground—in fact, I cannot but think that any method whereby we may help the animals to extract easily the greatest possible amount of nutriment from their food is worthy of adoption. Of course, it should be known that "new" oats and "new" hay are not so good for feeding as when they have been kept, say, twelve months. Those who use maize must needs be careful, and although I know it is an economical force-producing food, and very extensively used, yet if given in excessive quantities it makes the animals what I call "soft." They sweat profusely. Maize does not produce a hard condition like oats, therefore I would not give my horses more than 5 lb. per day each. Beans are a splendid food for extra heavy work, but sharps have a tendency to make the horses' legs puffy. Bran is not used in large quantities for horses, but a weekly bran mash is very beneficial. If straw is used it must be sparingly, and, further, it should be sweet and clean, or it will cause trouble. Cut the chaff ¾ in. long, and I would recommend the food to be mixed and given damp, this prevents the horse from separating the grain from the chaff. Feed on the little and often principle, and keep the manger sweet. Don't leave any food in from one meal to another, it becomes stale. Strive to feed regularly. Supply 3 to 5 lb. roots daily, either carros, potatoes, or swedes; also a lump of rock salt in the manger. This will aid the powers of digestion and assimilation, and is preventive of worms and stomach acidity. I notice that a horse will use ¾ oz. of rock salt daily. Water before feeding, if he is not sweating heavily; if so, take the chill off the water.

Personally, I strongly depreciate the use of drugs in the stable, unless it is an aperient on going out to grass in the summer, and when being put on to dry food again. There is nothing to beat thorough grooming for giving the horses a sleek coat, the dandy brush and straw wisp being the best tools to use when grasped in willing hands.

The stable should be well constructed and properly ventilated. Many that I have been in are, unfortunately, neither. In conclusion, possibly I may have missed a few points, but if teamsmen would follow the direction given above I am confident they would obtain excellent results.—Horseman.

Don't be surprised if you have an attack of rheumatism this spring. Just rub the affected parts freely with Chamberlain's Liniment and it will soon disappear. Sold by all dealers.

Horsemen Attention!!

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevents the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

Before Using

After Using

Use this preparation thoroughly for alland every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR :--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly rccommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

Hillsboro, N. S.

MESSRS. FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

DEAR SIR :--I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

W. A. C. RANDALL, M. D.

FRASIER THORNTON & CO., Cookshire, Que.

DEAR SIRS :—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

(Signed) G. E. CRONKHITE, (Horseman),
Hawkshaw, N. B.

March 28th, 1911.

Changing the Coat in Spring

Horses which have been left unclipped during the winter are usually the first to commence changing their coat in the spring; that is as regards those which are stabled. Horses that lie out generally cast the winter coat very late, because the fact of their being exposed in the open retards the change of coat materially. The warmth of a stable and warm rugging, on the other hand, cause the coat to be shifted sooner and more quickly. Frequently unclipped horses which are well fed and warmly stabled will commence to lose their old coat towards the end of February, but the process is of course very gradual at first so early in the season. The fact of a horse having been clipped for the last time very late in the winter will always cause it to be late in growing its spring coat, and in extreme cases under these circumstances a horse may remain broken-coated (that is, with some portion of the old coat still on and the spring coat only partially through, so that the animal has a patchy appearance) until June. And when it finally is completed, the summer coat will not look particularly well, but will be more or less coarse, and not as glossy as it might be. For these reasons it is always a bad policy to have horses clipped again much after the turn of the year. The most satiny coat certainly is produced when a horse is left unclipped in winter time. Unless there is some special and good reason for desiring to have the winter coat off at the earliest possible moment, it is not advisable to seek to hasten the coat-changing process in the spring unduly by artificial means, for that will not tend to improve the appearance of the new coat, but the reverse. The best way is to allow nature to take her own course in the matter. The old coat will come away of its own accord in due course, the hairs dropping out as soon as they are dead. To force them off before they are quite dead means exposing the growing spring coat underneath prematurely. As it is always a somewhat trying time for horses when they are shifting their coat in spring, and they are apt to lose condition somewhat in consequence, it is advisable to give them a little extra corn then. A few handfuls of split peas or pea meal may also advantageously be added to the daily food ration at this period in the case of horses doing steady and fairly hard work, peas being an eminently strengthening food.

Digestive Trouble in Young Foals

An important detail in the management of young foals is to watch the action of the bowels. Ordinarily this will be regular enough, but there are not infrequently cases in which scouring sets in, while constipation also sometimes occurs. A useful and perfectly safe remedy to administer in either case is castor oil, a dose of which will generally put matters right when the trouble is not too serious. Castor oil has a very gentle action, and is free from any irritating or upsetting tendency, this being well suited to the delicate organization of the young foal. The first milk secreted by the mare after foaling is of a special nature, and contains the so-called colostrum, which exerts a certain purging effect on the digestive tract of the newly-born foal, and this normally serves to bring about the evacuation of the faecal matter, usually more or less hardened, which has accumulated in the foal's bowels before its birth. It may, however, happen that the colostral milk is not sufficiently potent in its effect to ensure this, so that the bowels remain stopped up, which may have a very serious result, unless the constipation is successfully relieved in good time. One should therefore always be careful to note whether the newly-born foal duly evacuates itself, and should it fail to do so some castor oil must be given, while it may further be advisable to put some glycerine into the bowel, in order to soften the hardened faeces which may be stopping up the passage. Scouring or diarrhoea in young foals is most usually due to indigestion or some upset of the stomach, brought on in various ways. Oftentimes it arises in consequence of the mare's milk being unfavorably affected by unsuitable food or a sudden change in her diet, while not infrequently it is brought on by allowing a foal to suck the mare when she is in a heated state after having been at work. Keeping a mare which is used for work away too long from her foal, so that it gets inordinately hungry, and so is caused to overdrink itself when finally given access to its dam, also often starts the trouble. Another potent cause of scouring in foals during the first week consists in their catching a chill through getting wet or being exposed to cold easterly winds.

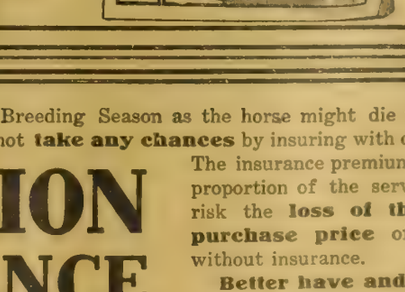
YOUR VITALITY CAN BE RESTORED

Strong, vital, healthy manhood fascinates all who come within its influence. As true as you are a living, breathing human being, I can restore your VITAL strength; there is not a shadow of a doubt as to what I can thus do. BUT there is a single condition, one restriction I put, a certain solemn promise I exact from you before you can exact a promise from me; namely: you must unconditionally agree now at once and forever to discontinue all dissipation; with this out of the way I will do the rest. Remember what I say; no matter what your present condition; no matter what has happened in the past, just forget it and put yourself in my hands; everything will come out as you wish it. I use no drugs, no lotions, no medicines; I place no foolish restrictions upon you; just lead a natural life, get all the enjoyment you possibly can, but cease dissipation; always remember that. I can then restore your vital energy: I can take you out of the half-man class and put you in the spotlight of full, healthy, contented vigor; I can make you feel young again and keep you feeling young to a ripe old age, because I drive into your system the one thing which keeps the whole organism in balance, namely, VITALITY. My HEALTH BELT with suspensory attachment is the greatest single self-treatment remedy or VITALITY RESTORATIVE that the world has ever known, or probably ever will know. It is worn comfortably about the waist all night and every night for two or three months. Thus while you are sleeping it sends a great, soft, potent, life-giving current of VITAL FORCE into your blood, your nerves and your organs. There is not a moment's wait. It helps you immediately; it commences from the first time worn, to show you the sunshine of new energy; it takes the kink out of your back in one night; it makes a man of you after you have given up in despair, simply because it supplies you with VITAL POWER—which means health. Just stop to think. You have the same organs, nerves and fibre, the same make-up exactly that healthy, vigorous men possess, the only difference being you are under tone; you need a foundation of NEW VITAL RESERVE, and it is this I give you. There is no reason why you should not be as strong, healthy and vigorous as the best fullest-blooded man of your acquaintance. The matter is easy if you do your part. Never mind about buying a HEALTH BELT as yet; first get in communication with me; read over my booklet, and if you want to do so tell me your physical ailments that I may advise you; then a little later we can arrange in some way for you to try my HEALTH BELT. But first fill in the coupon and get the book free, or call at my office. My HEALTH BELT also cures Rheumatism, Kidney, Liver and Stomach disorders.

Let Me Send You THIS BOOK Free

My book, as described above, will be sent in plain sealed envelope to anyone who fills in the below coupon. It is fully illustrated with photo reproductions, printed on fine coated paper, and should be read by every man, young, middle aged or elderly, whether ailing oa strong. Write or call to-day. Hours, 9 to 6.

DR. M. F. SANDEN CO., 140 Yonge St., TORONTO, ONT.
Dear Sirs:—Please forward me your Book, as advertised, free, sealed



NAME.....
ADDRESS.....

OUR Stallion Policies, covering against loss by **Death through Accident or Disease,** are more liberal and afford more protection to owners than any issued by Competing Company. They contain no vexatious clauses, having been drafted to cover **the special conditions** met with in this Country. They cover the horse no matter **where he might be** and not merely **in his own stable,** as certain Companies do. This is very important during the Breeding Season as the horse might die while being on the road. Do not **take any chances** by insuring with others, **insure with us;** The insurance premium represents only a small proportion of the service fees earned. Better risk the **loss of the premium** than the **purchase price** of your beast if it dies without insurance.

STALLION INSURANCE

Better have and not need than need and not have.

All kinds of live stock insurance transacted. *Write for particulars and address of nearest agent.*

THE GENERAL ANIMALS INSURANCE CO. OF CANADA, Head Office: 71a ST. JAMES STREET, MONTREAL, Que.

POULTRY.

Advantages and Disadvantages of Free Range

Free range has its merits and its demerits. To quickly grow young stock there is nothing better; for practical poultry farming—raising eggs and table poultry—it is not advisable.

The young, growing chick, needs a variety of food and it requires exercise. When it can have a combination of both the food is properly assimilated, and the seeds, the bugs, the worms, and the tender grass found on the range grow bone, muscle and feather. The little fellows are on a romp the live long day, and at night their crops are packed hard with the variety they have gathered on their travels; the violent exercise quickly puts them to sleep, and nature gradually digests the food.

The consequence is they grow like weeds. Late-hatched chicks given free range soon forge ahead of their older brothers that from the start have been kept in small, barren enclosures.

Some years ago the writer visited the famous Oakland Farm, Taunton, Massachusettes, which at that time was the home for prize-winning Light Brahmas and Buff Cochins. To our surprise we learned that nearly all the birds on this farm were hatched and reared during summer. We saw July-hatched Brahmas and even September-hatched Cochins, and the latter as large as the former. We were then informed by the manager that all the Madison Square Garden winners were hatched in July. To the writer it was a revelation. Who ever before heard of hatching Asiatics during the hot months? Yet here we had the example. What was their secret? Shade and free range.

But when it comes to hens, we find that for successful egg farming, or market poultry, limited areas are more profitable. If the hens are provided with proper food and care, they will give larger egg yields when confined to runs than if running at large and, besides, there will be no danger of hidden nests and loss of eggs.

Experiments made with table poultry also strongly favor more or less confinement. If fed on meat producing foods, the carcasses of yarded poultry are not only more attractive in appearance, but the flavor is superior.

In free range poultry we find toughened sinews, meat more or less tough, and lacking in juiciness.

It is for this reason that epicures prefer poultry from the yards of expert poultrymen rather than "country chickens," or "farm-raised poultry."

Hens need bulky food. Clover hay or alfalfa hay cut in half inch lengths help to make an ideal ration. If cooked and mixed with bran it makes an excellent breakfast. Clover and alfalfa not only promote digestion, but also largely assist in supplying the elements necessary for the albumen.

A successful poultryman says that he keeps the combs of his poultry brightened by putting corn in a bucket and dampening with water, and then stirring in about a quart of powdered air-slaked lime. He feeds this twice a week as an evening meal.

Fattening poultry on food mixed or moistened with skim milk instead of water, produces whiter flesh and superior flavor. Skim alone is a highly nitrogenous food; the carbo-hydrates have been removed in the butter, so that it is not a complete diet for any animal. The fat of the cream, however, can be cheaply substituted with corn or cornmeal.

A fowl should always be fattened as quickly as possible. Ten days is long enough, but it should be confined either in a coop or a number in a small yard. They must have a continual supply of fresh water, and should be fed four times a day, the first meal being early, and the last one late. A recommended mixture is three parts cornmeal, one part ground oats, one part bran, one part crude tallow, the entire lot scalded and fed for the first three meals, with all the corn and wheat that can be eaten up clean at night, weigh the articles given.

The poultry man who follows the daily cleaning method, is generally the one who looks after the other essentials, considering them equally as important. Cleanliness should be more rigidly enforced in winter than in summer, for the reason that on account of much bad weather, and longer nights, fowls are compelled to spend more time in the houses.

It is a sad commentary on a man's humane ideas to compel a flock of poultry to roost for a week in an odor-laden atmosphere of droppings accumulated during the period. You may strew ashes, road dust, land plaster or what not over the bed of filth each morning, but the odor will grow stronber and stronger. When the weekly cleaning takes place it is not necessary to go inside the house to know what is going on; the fact is smellable some distance off. This odor finds its way into every crack and crevice in the house.

The color of the skin of the fowl can be changed by feed. Sometimes the color of the skin is important, but half of the fowls that are sent to market have anything but a yellow skin. In breeding for market it is important to have a breed that grows rapidly and fleshens up young; the skin should be yellow, and if the feathers are all white both the chicks and old fowls will look much better when dressed than those with colored feathers.

The Houdan is the only French breed that ever gained a stronghold in America. The French people are noted epicures, and the French breeds of poultry are among the very best for table purposes. If the Houdan was better known it would become a still greater favorite, for it possesses the most desirable qualities for a table fowl. The breast meat is plentiful, and of a fine texture, rich and juicy. There is no breed of equal weight that will yield so much meat as the Houdans. They dress with less offal than any other breed.

Broiler raising calls for pluck, grit and perseverance. The parent stock must be strong and vigorous. Care, feed, fresh air and exercise are the essentials for growing a chick to broiler size. The chick must grow from the first day and continue to do so until the marketable weight is reached. Some chickens grow faster than others, and in such cases the weak must be separated from the strong, so that the chicks of only the same development are kept together. Cleanliness is important, especially in the hovers, and sufficient light litter must be kept in the brooder runs in order to induce exercise in scratching for grain.

Post Mortem examinations have shown that the death of chicks, during artificial inrubation and rearing can be laid to four causes; First, to heredity or to environment during the period of incubation. Successive alternate periods of heat and cold during incubation are responsible for a very large proportion of abnormalities. Second, to overcrowding in the brooders, resulting in death by suffocation, trampling, etc. Third, to imperfect sanitation, lack of ventilation, sunlight, etc.; tuberculosis flourishes in the dark, poorly ventila-

Talking Machines, Sewing Machines, and Used Organs at Half Price

Suffered With A Lame Back

COULD NOT STRAIGHTEN UP.

Many people fail to understand the significance of a lame, weak, sore or aching back.

When the back aches or becomes weak it is a warning that the kidneys are affected in some way.

Heed the warning, cure the back and dispose of any chances of serious kidney trouble following.

Mr. C. Grace, Hamilton, Ont., writes:—"I was suffering with a lame back, and for two weeks was not able to straighten up to walk, and hardly able to sit down for the pains in my back, hips, and legs. I had used different kinds of pills, plasters, liniments and medicines, without any relief. One day I read about Doan's Kidney Pills and decided to try them. Before I had half a box used I felt a great deal better, and by the time I had used two boxes, I was cured. I have no hesitation in recommending Doan's Kidney Pills."

Price, 50 cents per box or 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering specify "Doan's."

THIS WASHER MUST PAY FOR ITSELF.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right," but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse was'nt "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now, this set me thinking.

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that, without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges, nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week 'till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

Address me personally;

O. G. MORRIS, Manager 1900 Washer Co'p'y.

357 Yonge Street, Toronto, Can.

ted brooders. Fourth, to improper feeding. For the continued maintainence of health there must be a definite proportion between the amount of carbohydrates, fats and the nitrogen—containing proteins. The Rhode Island Experiment Station says that a ration wholly vegetable is almost certain to contain a too-low percentage of nitrogen, while a ration exclusively animal is very sure to be deficient in carbohydrates.

I. K. Delch says the fancier and the poulterer are getting closer together. The latter now raises thoroughbreds, and sells his best pullets to the fancier. In this way both wings of the poultry industry are able to flap together. But even if all the stock is to be for market purposes, it is more profitable to keep pure bred stock than to have a lot of mongrels with all sorts of shapes, sizes, conditions, etc. There must be uniformity of stock as much as uniformity of methods.

Venetian red is an article prescribed as both a preventative of and a remedy for roup. But there seems to be a misunderstanding of the nature of Venetian red, through confounding it with oxide of iron red. Venetian red was called light red. This is yellow ochre calcined, which makes a fine light red. Henry Hale says numerous other reds are now mined in numberless places, and are often sold for Venetian red, and often used, even by painters, who do not know the difference. Venetian red proper contains a little if any, iron probably a very small proportion, while the other mentioned reds are more or less composed of oxide or (more correctly) peroxide of iron; some contain over 70 per cent. of iron, and are known to the trade as oxide of iron paints. This is the article that has the tonic property; is what should be given the fowls.

There is something in the shape of an egg that tells the story. If it is ridgy, long and peaked, unusually large, or if it is "out of shape," it will not tell you whether it will hatch a male or a female, but it tells a truthful story of the condition of that hen. Such eggs come only from hens that have diseased ovaries, generally caused by being in a too-fat condition.

Better sell honest eggs—eggs that you can guarantee fresh. Remember that after three days of age an egg is no longer strictly fresh. It is necessary to date them the day they are laid to be sure of the eggs.

No man can properly attend to more than five hindred hens. It is not only a question of feeding and watering, but it is necessary to closely watch their condition, to keep their houses in repair and make them comfortable, and a long list of little details that dare not be neglected.

Pure Bred Poultry for Profit

Editor Maritime Farmer:—

By reading the Maritime Farmer I get a great deal of good advice and the practical experience of others on poultry keeping, particularly on hens.

I wish to say a few words in favor of the good old hen. Three years ago this spring I settled down on a new farm through which the Pugwash branch of the Oxford and Pictou Short Line crosses. There is a station point at one side of the farm at a distance of only 80 yards from the house in which I live. As the farm was new, with only a small area of cleared land I was puzzled to know how to begin or what to keep that would pay the best for the capital invested. I decided to give hens a trial and as I am a firm believer in pure bred stock of all kinds, each breeder to be governed by his own

(Continued on page 556)

$5,000,000.00
FOR PEERLESS WAY POULTRYMEN

Into the pockets of the users of The Peerless Way last year went five million dollars made from the poultry these people raised. Yet chickens are scarce in Canada and eggs are the scarcest of all food commodities. That is positively the fact.

To-day there are not enough Canadian CHICKENS or EGGS to go around. Thousands of chickens and hundreds of thousands of dozens of eggs are being shipped into Canada from the United States and other countries to help meet the demand.

Yet there is a shortage! Eggs are commanding a tremendous price—chickens are worth dollars.

Now is the time to take advantage of this situation and make money out of it yourself. You can raise and sell 600 chickens this next year, and you will find a quick and sure market for every one of them. You can get the top notch price for all the hundreds of dozens of eggs that your poultry lay.

Let us tell you how!

Poultry raising is the best business for any farmer, any farmer's wife or farmer's child. The poultry crop is the one crop that never fails. It pays better for the time and money invested; the profit is surest; it isn't overcrowded and never will be.

Our book "When Poultry Pays," will show you. Let us send it to you. It is interesting; it is instructive, and it contains the proof.

You need this book. It will be mailed free. A post card will bring it.

David Copperfield.

By Charles Dickens.

(Continued from March 25th issue)

"Peggotty dear, you are not going to be married?"

"Me, ma'am?" returned Peggotty, staring. "Lord bless you, no!"

"Not just yet?" said my mother, tenderly.

"Never!" cried Peggotty.

My mother took her hand, and said:

"Don't leave me, Peggotty. Stay with me. It will not be for long, perhaps. What should I ever do without you!"

"Me leave you, my precious!" cried Peggotty. "Not for all the world and his wife. Why, what's put that into your silly little head? For Peggotty had been used of old to talk to my mother sometimes, like a child.

But my mother made no answer, except to thank her, and Peggotty went running on in her own fashion.

"Me leave you? I think I see myself. Peggotty go away from you? I should like to catch her atit! Eo, no, no," said Peggotty, shaking her head, and folding her arms; "not she, my dear. It isn't that there ain't some Cats that would be well enough pleased if she did, but they shan't be pleased. They shall be aggravated. I'll stay with you till I am a cross, cranky old woman. And when I'm too deaf, and too lame, and too blind, and too mumbly for want of teeth, to be of any use at all, even to be found fault with, then I shall go to my Davy and ask him to take me in."

"And, Peggotty," says I, "I shall be glad to see you, and I'll make you as welcome as a queen."

"Bless your dear heart!" cried Peggotty. "I know you will. And she kissed me beforehand, in grateful acknowledgement of my hospitality. After that, she covered her head up with her apron again, and had another laugh about Mr. Barkis. After that, she took the baby out of its little cradle, and nursed it. After that, she cleared the dinner-table; after that, came in with another cap on, and her work-box, and the yard-measure, and the bit of wax candle, all just the same as ever.

We sat around the fire, and talked delightfully. I told them what a hard master Mr. Creakle was, and they pitied me very much. I told them what a fine fellow Steerforth was, and what a patron of mine, and Peggotty said she would walk a score of miles to see him. I took the little baby in my arms when it was awake, and nursed it lovingly. When it was asleep again, I crept close to my mother's side, according to my old custom, broken now a long time, and sat with my arms embracing her waist, and my little red cheek on her shoulder, and once more felt her beautiful hair drooping over me—like an angel's wing as I used to think, I recollect— and was very happy indeed.

While I sat thus, looking at the fire, and seeing pictures in the red-hot coals, I almost believed that I had never been away; that Mr. and Miss Murdstone were such pictures, and would vanish when the fire got low; and that there was nothing real in all that I remembered, save my mother, Peggotty and I.

Peggotty darned away at a stocking as long as she could see, and then sat with it drawn on her left hand like a glove, and her needle in her right, ready to take another stitch whenever there was a blaze. I cannot conceive whose stockings they can have been that Peggotty was always darning, or where such an unfailing supply of stockings in want of darning can have come from. From my earliest infancy she seems to have been always employed in that class of needlework, and never by any chance in any other.

"I wonder," said Peggotty, who was sometimes siezed with a fit of wondering on some most unexpected topic, "what's become of Davy's great-aunt?"

"Lor, Peggotty!" observed my mother, rousing herself from a reverie. "what nonsense you talk!"

"Well, but I really do wonder, ma-am," said Peggotty.

"What can have put such a person in your head?" inquired my mother. "Is there nobody else in the world to come there?"

"I don't know how it is," said Peggotty, "unless it's on account of being stupid but my head never can pick and choose its people. They come and they go, and they don't come and they don't go, just as they like. I wonder what's become of her?"

"How absurd you are, Peggotty," returned my mother. "One would suppose you wanted a second visit from her."

"Lord forbid!" cried Peggotty.

"Well, then, don't talk about such uncomfortable things, there's a good soul," said my mother. "Miss Betsy is shut up in her cottage by the sea, no doubt, and will remain there. At all events, she is not likely ever to trouble us again.

"No!-' mused Peggotty. "No, that ain't likely at all—I wonder, if she was to die, whether she'd leave Davy anything?"

"Good gracious me, Peggotty," returned my mother, "what a nonsensical woman you are! when you know that she took offence at the dear boy's ever being born at all!"

"I suppose she wouldn.t be inclined to forgive him now," hinted Peggotty.

"Why should she be inclined to forgive him now?" said my mother, rather sharply.

"Now that he's got a brother, I mean," said Peggotty.

My mother immediately began to cry, and wondered how Peggotty dared to say such a thing.

"As if this poor little innocent in its cradle had ever done any harm to you or anybody else, you jealous thing!" said she. "You had much better go and marry Mr. Barkis, the carrier. Why don't you?"

"I should make Miss Murdstone happy, if I was to," said Peggotty.

"What a bad disposition you have, Peggotty!" returned my mother. "You are as jealous of Miss Murdstone as it is possible for a ridiculous person to be. You want to keep the things yourself, and give out all the things, I suppose? I shouldn't be surprised if you did. When you know that she only does it out of kindness and the best intentions! You know she does, Peggotty—you know it well."

Peggotty muttered something to the effect of "Bother the best intentions!" and, something else to the effect that there was a little too much of the best intentions going on.

"I know what you mean, you cross thing," said my mother. "I understand you, Peggotty, perfectly. You know I do, and I wonder you don't color up like fire. But one point at a time. Miss Murdstone is the point now, Peggotty, and you shan't escape from it. Haven't you heard her say, over and over again, that she thinks I am too thoughtless and too—a—a"

"Pretty," suggested Peggotty.

"Well," returned my mother, half laughing, "and if she is so silly as to say so, can I be blamed forit?"

"Noone says you can," said Peggotty.

"No, I should hope not, indeed!" returned my mother. "Haven't you heard her say, over and over again, that on this account she wishes to spare me a great deal of trouble, which she thinks I am not suited for, and which I really don't know myself that I am suited for: and isn't she up early and late and going to and fro continually—and doesn't she do all sorts of things, and grope into all sorts of places, coal-holes, and pantries and I don't know where, that can't be very agreeable—and do you mean to insinuate that there is not a sort of devotion in that?"

"I don't insinuate at all," said Peggotty.

"You do, Peggotty," returned my mother. "You never do anything else, except your work. You are always insinuating. You revel in it. And when you talk of Mr. Murdstone's good intentions—"

"I never talked of 'em," said Peggotty.

"No, Peggotty," returned my mother, "but you insinuated. That's what I told you just now. That's the worst of you. You will insinuate. I said, at the moment, that I understood you, and you see I did. When you talk of Mr. Murdstone's good intentions, and pretend to slight them (for I don't believe you really do, in your heart, Peggotty), you must be as well convinced as I am how good they are, and how they actuate him in everything. If he seems to be at all stern with a certain person, Peggotty—you understand, and so I am sure does Davy, that I am not alluding to anybody present—it is solely because he is satisfied that it is for a certain person's benefit. He naturally loves a certain person, on my account; and acts solely for a certain person's good. He is better able to judge of it than I am;for I very well know that I am a weak, light, girlish creature, and that he is a firm, grave, serious man. And he takes, said my mother, with the tears which were engendered in her affectionate nature, stealing down her face, "he takes great pains with me: and I ought to be very thankful to him, and very submissive to him even in my thoughts; and when I am not, Peggotty, I worry and condemn myself, and feel doubtful in my own heart, and don't know what to do."

Peggotty sat with her chin on the foot of the stocking, looking silently at the fire.

"There, Peggotty," said my mother, changing her tone, "don't let us fall out with one another, for I couldn't bear it. You are my true friend, I know, if I have any in the world. When I call you a ridiculous creature, or a vexatious thing, or anything of that sort, Peggotty, I only mean that you are my true friend, and always have been, ever since the night when Mr. Copperfield brought me home here, and you came out to the gate to meet me."

Peggotty was not slow to respond, and ratify the treaty of friendship by giving me one of her best hugs. I think I had some glimpses of the real character of this conversation at the time; but I am sure, now, that the good creature originated it, and took her part in it, merely that my mother might comfort herself with the little contradictory summary in which she had indulged. The design was efficacious; for I remember that my mother seemed more at ease during the rest of the evening, and that Peggotty observed her less.

When we had had our tea, and the ashes were thrown up, and the candles snuffed. I read Peggotty a chapter out of the Crocodile Book, in remembrance of old times—she took it out

A Windsor Lady's Appeal

To all women' I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Uterine and Ovarian Tumors or growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write teday. Address Mrs. M. Summers, Box H. 309 Windsor, Ont.

TWO WOMEN TESTIFY

What Lydia E. Pinkham's Vegetable Compound Did For Their Health—Their own Statements Follow.

Haliburton, P.E.I.:—"I had a doctor examine me and he said I had falling of the womb, so I have been taking Lydia E. Pinkham's Vegetable Compound and it has done me a lot of good. All the bearing-down pains have vanished. I have gained ten pounds in weight, the discharge is all gone, and I feel better than I have for a long time. I think any woman is foolish to suffer as I did for the sake of a few dollars.

"You can use my letter as a testimonial. It may encourage other poor women who suffer as I did to use your Vegetable Compound." — Mrs. Geo. Collicutt, Haliburton, Lot 7, P.E.I.

Read What This Woman Says:

New Moorefield, Ohio.—"I take great pleasure in thanking you for what your Vegetable Compound has done for me. I had bearing down pains, was dizzy and weak, had pains in lower back and could not be upon my feet long enough to get a meal. As long as I laid on my back I would feel better, but when I would get up those bearing down pains would come back, and the doctor said I had female trouble. Lydia E. Pinkham's Vegetable Compound was the only medicine that helped me and I have been growing stronger ever since I commenced to take it. I hope it will help other suffering women as it has me. You can use this letter."—Mrs. Cassie Lloyd, New Moorefield, Clark Co., Ohio.

of her pocket: I don't know whether she had kept it there ever since—and then we talked about Salem House, which brought me round again to Steerforth, who was my great subject. We were very happy; and that evening, as the last of the race, and destined evermore to close that volume of my life, will never pass out of my memory.

It was almost ten o'clock before we heard the sound of wheels. We all got up then: and my mother said hurriedly that, as it was late, and Mr. and Miss Murdstone approved of early hours for young people, perhaps I had better go to bed. I kissed her and went up stairs with my candle directly, before they came in. It appeared to my childish fancy, as I ascended to the bedroom where I had been imprisoned, that they brought a cold blast of air into the house which blew away the old familiar feeling like a feather.

I felt uncomfortable about going down to breakfast in the morning, as I had never set eyes on Mr. Murdstone since the day when I had committed my memorable offence. However, as it must be done, I went down, after two or three false starts half way, and as many runs back on tiptoe to my own room, and presented myself in the parlor.

He was standing before the fire with his back to it, while Miss Murdstone made the tea. He looked at me steadily as I entered, but made no sign of recognition whatever.

I went up to him, after a moment of confusion, and said: "I beg your pardon, sir. I am very sorry for what I did, and I hope you will forgive me."

"I am glad to hear you are sorry, David," he replied.

The hand he gave me was the hand I had bitten. I could not restrain my eye from resting for an instant on a red spot upon it; but it was not so red as I turned, when I met that sinister expression on his face.

"How do you do, ma'am?" I said to Miss Murdstone.

"Ah, dear me!" sighed Miss Murdstone, giving me the tea-caddy scoop instead of her fingers. "How long are the holidays?"

"A month, ma'am."

"Counting from when?"

"From to-day, ma'am."

"Oh!" said Miss Murdstone. "Then here's one day off."

She kept a calendar of the holidays in this way, and every morning checked a day off in exactly the same manner. She did it gloomily until she came to ten, but when she got into two figures she became more hopeful, and, as the time advanced, even jocular.

It was on this very first day that I had the misfortune to throw her, though she was not subject to such weakness in general, into a state of violent consternation. I came into the room where she and my mother were sitting; and the baby (who was only a few weeks old) being on my mother's lap, I took it very carefully in my arms. Suddenly Miss Murdstone gave such a scream that I all but dropped it.

"My dear Jane!" cried my mother.

"Good heavens, Clara, do you see?" exclaimed Miss Murdstone.

"See what, my dear Jane?" said my mother; "where?"

"He's got it!" cried Miss Murdstone. "The boy has got the baby!"

She was limp with horror; but stiffened herself to make a dart at me, and take it out of my arms. Then, she turned faint; and was so very ill, that they were obliged to give her cherry-brandy. I was solemnly interdicted by her, on her recovery, from troubling my brother any more on any pretense whatever: and my poor mother, who, I could see, wished otherwise, meekly confirmed the inter-

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send to-day.

We guarantee these burners to do as represented or money refunded.

dict, by saying: "No doubt you are right, my dear Jane."

On another occasion, when we three were together, this same dear baby—it was truly dear to me, for my mother's sake—was the innocent occasion of Miss Murdstone's going into a passion. My mother, who had been looking at its eyes as it lay upon her lap, said:

"Davy! come here!" and looked at mine.

I saw Miss Murdstone lay her beads down.

"I declare," said my mother, gently, "they are exactly alike. I suppose they are mine. I think they are the color of mine. But they are wonderfully alike."

"What are you talking about, Clara?" said Miss Murdstone.

"My dear Jane," faltered my mother, a little abashed by the harsh tone of this inquiry, "I find that the baby's eyes and Davy's are exactly alike."

"Clara!" said Miss Murdstone, rising angrily, "you are a positive fool, sometimes."

"My dear Jane," remonstrated my mother.

"A positive fool," said Miss Murdstone. "Who else could compare my brother's baby with your boy? They are not at all alike. They are exactly unlike. They are utterly dissimiliar in all respects. I hope they will ever remain so. I will not sit here, and hear such comparisons made." With that she stalked out, and made the door bang after her.

In short, I was not a favorite with Miss Murdstone. In short, I was not a favorite with anybody, not even with myself; for those who did like me could not show it, and those who did not showed it so plainly that I had a sensitive consciousness of always appearing constrained, boorish, and dull.

I felt that I made them as uncomfortable as they made me. If I came into the room where they were, and they were talking together and my mother seemed cheerful, an anxious cloud would steal over her face from the moment of my entrance. If Mr. Murdstone were in his best humor, I checked him. If Miss Murdstone were in her worst, I intensified it. I had preception enough to know that my mother was the victim always; that she was afraid to speak to me, or be kind to me, lest she should give them some offence by her manner of doing so, and receive a lecture afterwards; that she was not only ceaselessly afraid of her own offending, but of my offending, and uneasily watched their looks if I only moved. Therefore, I resolved to keep myself as much out of their way as I could; and many a wintry hour did I hear the church clock strike, when I was sitting in my cheerless bedroom, wrapped in my little great-coat, poring over a book.

In the evening, sometimes, I went and sat with Peggotty in the kitchen. There I was comfortable, and not afraid of being myself. But neither of these resources was approved of in the parlor. The tormenting humor which was dominant there stopped them both. I was still held to be necessary to my mother's training, and, as one of her trials, could not be suffered to absent myself.

"David," said Mr. Murdstone, one day after dinner when I was going to leave the room as usual; "I am sorry

YOU probably know the big plant shown below. It's a ***Massey-Harris*** plant--the name is familiar to everybody in Canada. Likely you know more about their business than we do. But--there's ***one point*** of ***mutual*** interest in the picture. The big plant shown is covered with

Brantford Roofing

Now, figure out the situation for yourself. The Massey-Harris People would insist on ***the best roof*** money could buy. They'd want a roof as near ***Acid-proof*** and ***Fire-proof*** as they could get it. They'd go into the roofing question ***thoroughly***. They ***certainly*** would demand ***facts***—not claims. Before specifying the roofing for this immense plant, they would be ***positive*** regarding its ***element-resisting*** powers. Well--to protect this valuable plant and its contents, they covered it with ***Brantford Roofing***--a roofing that is ***known*** to be practically ***imperishable.***

Shouldn't ***Brantford Roofing*** be the ***the best possible roofing*** for that building of yours? It dosen't matter whether it is a sky-scraper or a barn, the fact remains that ***you cannot buy better than Brantford Roofing.*** Yet it costs no more than ordinary roofing. Send for our Big FREE Book on the roofing question. You should know the facts it contains.

to observe that you are of a sullen disposition."

"As sulky as a bear!" said Miss Murdstone.

I stood still, and hung my head.

(Continued in next issue)

Training of Children

Never has there been a time when child study and child nature have been so universal. Many of the ablest thinkers of the world are engaged in studying the mind of the child. Many great authors have written columns on the subject. At no time in the history of the centuries has this theme come before the reading public as at present. It is beginning to be considered necessary that teachers should know something of the science of the child's mind. It is to be hoped that in the not distant future it will be considered essential that parents should have a knowledge of child physiology.

Providence in his supreme wisdom has ordained that humanity should be placed in individual homes. So the young man "a wooing goes" often often with as little thought as the birds in spring. It is immaterial whether he is a royal prince who wishes to induce a foreign princess to preside over his palace, or, an Indian brave who is seeking his dusky bride to share his smoky wigwam. The feeling is the same the young man is simply following the dictates of his nature.

At this time in the youthful suitor's career he is willing to sacrifice almost anything for his lady love. Instances have been known when he has even thrown away his beloved tobacco at the request of the young lady. So after a courtship long or short, as the case may be, they twain become one and, are pronounced man and wife. And a new home is established. The dearest spot on earth. All the world shut out and love within.

In due time, after many unnecessary forebodings and misgivings on the part of the young wife the child is born. The most precious gift God ever gave to gladden a home. An immortal soul to train for eternity. Although the young couple were happy before, now, their happiness seems complete. What an influence it has on the father, he who had been careless, thoughtless and perhaps selfish, now with added dignity becomes anxious to do just and right for the sake of his child who will be dependant on him. But what shall we say of the young mother who has gladly gone down to the "Valley of the shadow of death" for her child and now rejoices when the little atom of humanity is placed in her arms, and as the mother love awakensin her breast how she dreams of her child's future and promises in her heart of hearts to make it's life beautiful, as far as in her power lies.

To enable a mother to be successful in her great work of training her child she should have certain inherent qualities. She should be unselfish, cheerful, self-controlled with high ideals, accustomed to look daily to a higher Power for strength and inspiration, also as thorough an education as possible and a good disciplinarian.

The young mother is much better equipped for her work in our times than in the "good old days which were not always good" when it was considered correct for the young girl to marry in her early teens. Owing to the extended time given to education the marriageable age is later. It is reasonable to suppose a person could be more efficient in beginning the work of training a child, other things equal, at from twenty-five to thirty-five years old, than at fifteen or twenty. Although much could be

Proving by Actual Experiment

This experiment will always interest the children, and will provoke a good deal of thinking. The explanation, of course, is, that the lighted piece of paper which is inserted into the inverted glass drives out most of the air, so that when the mouth of the glass is quickly put down into the water there is very little air, and, consequently, very little pressure above the water within the glass. Hence, the weight or pressure of the air on the water outside the glass drives the water up into the glass to occupy the space from whence the air was driven by the burning paper.

A practical demonstration of this kind is always more convincing than any mere statement. This is particularly true of medical remedies.

The effect of the anti-toxin treatment for diphtheria is noticeable within a few hours, so that everyone must believe in its virtue. In a similar way, the treatment known as ORANGE LILY gives a practical proof of the progress it is making in curing women's disorders, and that, too, within a few days after commencing its use.

All authorities agree that in every case of women's disorders there exists a congested condition of the womanly organs. The circulation in these parts is sluggish or stagnant, and the result is that the broken-down tissue or waste matter which should be carried off if the blood was circulating freely, remains in these parts, causing inflammation, irritation, oppression of the nerves, etc. ORANGE LILY is not taken internally, but is applied direct to the suffering organs. It is absorbed into the circulation, and its antiseptic properties at once act on the waste matter referred to above. The consequence is that this waste matter, which is causing the inflammation, ulcers, nervous troubles, etc., begins to be discharged, and it continues to be discharged until all the foreign matter is removed from the circulation. At the same time the blood vessels and nerves are toned and strengthened, the nervous trouble disappears, the circulation is restored and good health follows.

Toronto, Ont., June 2, 1909.

Dear Mrs. Currah,—I wish to tell you that Orange Lily is doing me a great deal of good. Those ulcers come away one or two every week, and I have less pain and fewer headaches. I feel sure I will be perfectly cured in a little longer time.

MRS. D. S. T.

The explanation of the wonderful cures performed by ORANGE LILY is very simple. It is a scientific remedy, based on the discoveries of Pasteur and Lister. The conditions existing in all female troubles are alike in character, differing in degree and development only, so that a positive remedy, as ORANGE LILY is, acts with all the certainty of a chemical experiment. In order to convince every suffering woman that ORANGE LILY will cure her. I make the following

Free Trial Offer

I will send to every reader of this notice who suffers in any way from any of the troubles peculiar to women, if she will send me her address, enough of the ORANGE LILY treatment to last her 10 days. In many cases this trial treatment is all that is necessary to effect a complete cure, and in every instance it will give very noticeable relief. If you are a sufferer you owe it to yourself, to your family and to your friends to take advantage of this offer, and get cured in the privacy of your home, without doctor's bills or expense of any kind.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

Dr. de Van's Female Pills

A reliable French regulator. never fails. These pills are exceedingly powerful in regulating the generative portion of the female system. Refuse all cheap imitations. Dr. de Van's are sold at $5 a box, or three for $10. Mailed to any address. The Scobell Drug Co., St. Catharines, Ont.

said in favor of early marriages on this point, marriage between more mature persons is preferable.

There was a rich and powerful king who flourished many centuries ago, but whose writings are preserved, who said many wise and witty things but none truer than this- "Train up a child in the way he should go, and, when he is old he will not depart from it." This is logical too, and, has been well illustrated by supposing a person passes over a grassy field, in the same place a few times, it has no perceptible effect, but, let him pass over a great number of times, the path becomes brown and hard. So the impressions made on the plastic brain of the child by repetition become fixed, and, are what we call habit. So the necessity can be easily seen of forming good habits.

It is true that every child is born with inherited tendencies, but, proper training encourages the good and suppresses the evil.

The train of the child should begin at a very early age. Of course, the first days of the infant's life require care rather than training. Persons of moderate circumstanres should not consider it extravagant to employ a trained nurse at childbirth. She can not only safeguard the mother's future health, but can teach her in her inexperience the best methods of caring for her child. For instance, many a person has gone out in the world as born blind when their blindness was caused, simply, by improper treatment of the eyes in infancy.

How quickly the little one who does not seem to know, at first, anything but to get its nourishment begins to use its five senses and soon can think and act for itself. When the child begins to take notice and wishes to have its own sweet way, the mother realizes her great work of training must begin. However, care should be taken not to be too anxious as the fond mother is tempted to be, wishing her child to be so perfect. When it is taken into consideration how much knowledge a child absorbs in the first years of its life, among other things, learning a language, it will be seen the danger of overtraining it.

The first great thing to teach the child is obedience to its parents. This is the foundation that must be insisted upon. The child's will must be brought into subjection to the will of the parent. Not the old-fashioned idea of breaking a child's will by any means, for a strong will properly trained is one of the best traits that a person can possess. By constant care and watchfulness the child can be taught to be obedient. This point once gained, the rest becomes comparatively easy. Obedience in the child might be compared to the helm of the ship, with which the captain can control the largest vessel afloat. But, if the helm is defective, he is at the mercy of the waves.

The next great point in the training of the child is truthfulness. Children have naturally much imagination. As for example, a little girl with some dolls dishes and a few pieces of cake can have a large and delightful tea party with no one present but herself. Imagination should not be condemned but a parent with a particle of discrimination can tell when the real falsehood appears, which should never be condoned, under any circumstances.

It is a most difficult question how to enforce the rules necessary for the proper training of the child, but the mother should not be discouraged if occasional lapses occur. It requires precept upon precept here, a suggestion there, a helpful hint with the greatest patience and love. Remember Rome was not built in one day

HOW TO CONQUER RHEUMATISM AT YOUR OWN HOME

If you or any of your friends suffer from rheumatism, kidney disorders or excess of uric acid causing lameness, backache, muscular pains, stiff, painful, swollen joints, pain in the limbs and feet; dimness of sight, itching skin or frequent neuralgic pains, I invite you to send for a generous **Free Trial Treatment** of my well known, reliable **Chronicure**, with references and full particulars by mail. (This is no C. O. D. scheme.) No matter how many may have failed in your case, let me prove to you, free of cost that rheumatism can be conquered. **Chronicure** succeeds where all else fails. **Chronicure cleanses the blood and removes the cause.** Also for a weakened, run-down condition of the system, you will find **Chronicure a most satisfactory general tonic** that makes you feel that life is worth living. Please tell your friends of this liberal offer, and **send today** for large free package, to **MRS. M. SUMMERS, Box E. 309—Windsor, Ont.**

For rheumatism you will find nothing better than Chamberlain's Liniment. Try it and see how quickly it gives relief. For sale by all dealers.

nor was a child's character formed without some trials. Heaven is not reached with one bound.

It is a question whether children can be trained without corporal punishment. Happily it is not so common as formerly. The best schools have practically abolished it. Of course, when laws are broken punishment must follow for the good of the culprit.

But surely there are other ways of dealing with the child more effectively. Solitary confinement, never in a dark room, for not too loog a time gives excellent opportunity for reflection. A child should never be threatened with punishment which is not enforced. Scolding should not be indulged in. A child should be constantly encouraged to overcome his faults. Tell a child he is a "bad boy" and he will soon try to become one. Teach the reason for doing or not doing a thing and it is surprising how even a young child will grasp the thought and do as required.

In no place is "union strength" more than in the home. Parents should stand united. Although the mother has the most responsibility in training the child the first years of its life she should be ably supported by the father and she in turn should teach the children to obey and respect him.

The atmosphere of the home influences the child unconsciously. Kindness, cheerfulness, praise, and encouragement all help. The home that is kept in order, cleaniness and neatness has an uplifting tendency on the receptive mind of the child. Industry is one of the virtues. The child should be taught to be helpful. To be kept busy is a demand of the child's nature.

With happy days, dark days, and days that are neither happy nor dark the time glides swiftly away and our little hero starts for school. The government has wisely placed the legal school age at six years when it was formerly five. It will make little difference with a child's later education if he does not go until seven. It will not be of much benefit on this auspicious morning as the little fellow marches off so proudly with his book and slate to say, "now son, be sure and be a good boy and mind the teacher." The mother knows in her heart she has done her duty, and, has been successful, and is not afraid to trust her boy, so he goes forth the joy and pride of the teacher, not necessarily the brightest pupil but the one she will have the least trouble with simply because he has been properly trained at home.

When the child first goes to school he generally enjoys it. It is only when other interests come in at a later age that he wishes to remain away. But occasionally a timid and sensitive child dreads the school and shows a determination to stay at home. Here the mother should be very firm and should not be unduly alarmed if sudden severe illness attacks her young hopeful at twenty-five minutes or so after eight in the morning. Usually if a child is kept steadily at school, after a short time his reluctanre wears away and he enjoys the school life, especially if the teacher tries to make it pleasant for her pupils. Parents should take an intelligent interest in the teacher's work. They should be sympathetic and always speak highly of the teacher in the presence of the children.

It would be impossible to have a well-rounded character fully developed on all sides without religious training. The child should be trained in its earliest years that God loves him and should be encouraged to love Him in return. The habit of secret prayer should be formed. Religious training has a wonderfully helpful influence on the child in its physical

What Three Bushels More to the Acre Means

EIGHT years ago the farmers in a central state raised average crops that ran three bushels less to the acre than they now get. Suppose each acre of farm land in this country were so tended that it produced an equal increase. How much more money would farmers have, with which to buy the luxuries of life that they earn and deserve?

What others have done, you can do. Your share in this prosperity depends entirely upon yourself. The first step for you to take is to fertilize your land properly with manure spread by an

I H C Manure Spreader Corn King or Cloverleaf

Manure cannot be spread as it should be unless a machine is used. An I H C spreader covers the ground with an even coat, light or heavy as may be needed, and pulverized so that the plant food elements in the manure combine with the soil to best advantage.

The spreader that does this work as it should be done must have many excellent mechanical features. The apron should move without jerking; the beater should meet the load at exactly the right point to pulverize the manure without too greatly increasing the draft of the machine; the speed changes of the apron should be positive whether the spreader is going uphill or down, otherwise the spreading will be uneven. All these features are provided for in the construction of I H C spreaders.

The I H C local agent carries in stock the machines best suited to your locality. See him for catalogues and full information, or, write the nearest branch house.

and mental life and training.

In this busy age clergymen of all churches lament the decadence of family prayer. But good John Wesley said: "There is always time for prayer and provender." It is a beautiful custom to commence the day by singing a hymn, where the family is musical, reading a selection from God's word and all bowing before our Heavenly Father to thank him for his mercies and ask him for continued care. The children should be taught to take part at the family altar.

It is to be regretted that owning to sectarian differences religious training is not allowed in the schools. Although the public school curriculum is overloaded with necessary and unnecessary subjects no place is found for the most important of all training.

Of course, the teachers as a class are teaching by their lives and influence the highest truths. But this is not enough as witness Scotland where the bible is a text-book and the children are brought up on the book of proverbs, consequently, in whatever part of the wide world a Scotchman is found he is a friend and advocate of religion and education.

It is utter folly for parents to try to give their children a religious training if their lives do not correspond with their teachings. There are

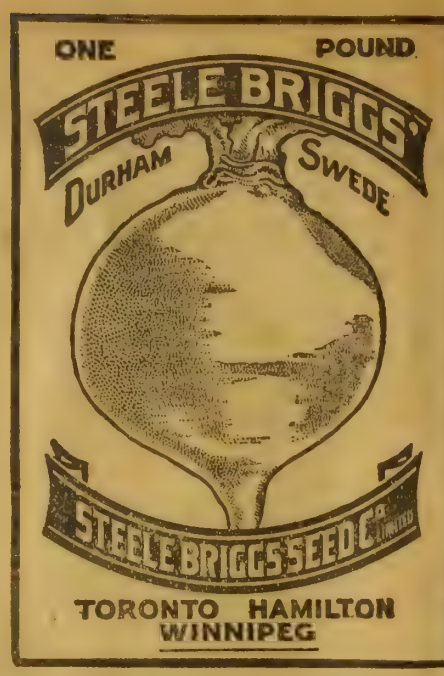
Water Lilies in the Experimental Farm Gardens, Charlottetown, P. E. I.

no hypocrites in the home. All stand at their best and at their worst. Although the very young child's confidence in the parent is supreme in later years children sit in judgement on their parents, they then perceive their faults but give them credit for their virtues. Many a person has lived a more wholesome, purer and nobler life for their children's sake than they otherwise would.

No effort should be spared to make the home bright, cheerful, attractive and beautiful so that the children will find their greatest happiness within its walls. When the shades of evening fall how contented the family can be with a bright light, warm fire and plenty of amusements. Music has a refining influence; games are helpful, they train the eye develop quickness and couage, but reading is the best amusement. By its means a person can become acquainted with the greatest minds. A cultivated taste in reading formed while young is a joy and comfort while life lasts.

Birthdays, the one day in the year which the child is the hero, and other anniversaries should be kept in some special manner. They not only provide the joy of the passing hour but they serve as milestones of happy remembered days, and these memories may later serve as an incentive to better things among the world's varied temptations. When one can bring pleasure by such simple means, it is worth while to make the effort because the time is so short that the young birds are in the home nest, and, they are gone before their parents realize their wings are strong enough to carry them.

It is deplorable that in modern life it is considered a misfortune to have a great family. This is a great mistake. The companionship of brothers and sisters will do more for the real making of genuine manliness and womanliness than the few extra comforts that it might be possible to provide in a smaller family. And if the parents have to make sacrifices when the children are young, they are amply compensated for it as they grow older. Although every child requires different treatment some are so easily trained while others seem to be born to do evil, it is reasonable to suppose that a mother could train her child better if it was her seventh or eighth than if it was her first. Parents should have high ideals for their children should realize their possibilities, and, should stir their ambition



TURNIPS FOR FALL FEEDING.

Our **TURNIP SEEDS** have made the name Steele, Briggs a household word in Canada. Here is a selection of Swede Turnips that possess no rivals. They are the newest and most vigorous production of celebrated growers.

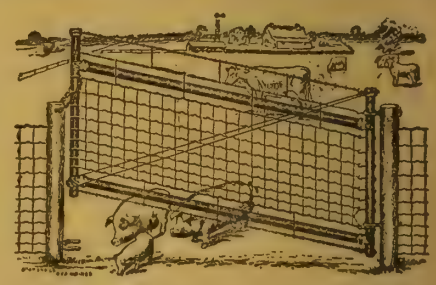
Improve Your Farm

FARMERS OF CANADA, WHENEVER YOU FIND IT NECESSARY to set up new gates on your farm, investigate the "Clay" Steel Farm Gate. This gate has features not possessed by any other gate. These features have commended "Clay" Gates to nearly all the leading stockmen of Eastern Canada, and have led to their purchase by the Ontario Agricultural College, Guelph; the Government Experimental Farm at Ottawa; the Model Farm in connection with Macdonald College, Quebec.

Clay Steel Farm Gates

have been bought by some thousands of Canada's best farmers. 30,000 "Clay" Gates were sold in 1912. This extensive appreciation of "Clay" Gates is the soundest possible evidence of the immense superiority of this Gate. If it costs a little more than the ordinary Gate, it is worth more—much more. Then consider this: Farmers who have had this Gate "on trial" have never given it up. Read our guarantee.

I GUARANTEE every Clay Gate to be free from defects in material or workmanship. I will replace free any parts, or the entire gate, giving out for such reasons.
H. RALPH STEELE, Manager.



This Gate won't sag, bend, break, burn, blow down or rot. Positively keeps back breachy cattle. Can be raised as shown. Will last a life time. Made of tubular steel of large diameter (far stronger than gas pipe or tee or angle iron) and heavy wire mesh fabric. A gate for every purpose. All sizes.

60 Days' Free Trial

One or a dozen "Clay" Gates will be sent on 60 days' Free Trial. State width of opening. Try them before buying them. Send today for illustrated Price List.

to take advantage of everything that will help them upward, including our splendid educational systems. A child with a sound body, bright intellect and good memory can be fitted to fill the highest position in our country and to help their fellowmen. But through bad training he may grow up disobedient, untruthful, ignorant, idle, dishonest and dissolute to go out into the world to prey on law-abiding citizens or to become a tool in the hands of designing men. Our prisons are full of them. This contrast gives some conception of the mother's work in the seclusion and quietness in the homes of our land. These nation-builders are at work conserving, moulding, developing and guiding the lives and destinies of the future citizens of our country. The men and women upon whom will rest the responsibilities of the affairs of the greater Canada, eager, earnest and powerful. If at times in the mist and solitude of their work they loose heart may they realize with clearer vision the meaning and value of their days of stress and toil.—Paper by Mrs. W. D. Smith Blissville, N. B., read at the recent Convention of Women's Institute, Fredericton, N. B.

The Farm is the Place for You.

A young man applied for a position to a commission firm in the Live-stock Exchange building, says the Christian Endeavor World.

"I want a job. I am a first-class stenographer and bookkeeper."

The head of the firm looked at him for a minute.

"Where do you come from?" he asked.

"I live in Central Kansas. My father is a farmer and owns a big ranch."

"How much do you expect a week?"

"Well, I think I ought to be worth twelve dollars a week."

"Does you father need help at home?"

The applicant admitted that his father needed hired help.

"Young man," said the live-stock man, "the farm is the place for you. At first you would scarcely make enough here to pay your board. At home your father would be willing to pay you good wages, and that would be clear profit."

The boy looked at the floor. "I guess you're right," he admitted. "I'll go home to-night."

Many another farmer's son who is uneasy and ambitious for a life in the city should cut this out and paste it in his hat.

As I visit the great cities, I wonder how anyone of his own free will can live in one of them.

Many of us have to, to be sure. Our work lies in the city and we have to go to the daily treadmill; and the most we can hope for is a quiet home in the suburbs where we may spend our nights and Sundays, and perhaps a little farm where we may end our days when life's more strenuous work is over.

But the country, with its innumerable charms, its growing things, its animal life, its freedom, its good air, its sunshine, its glorious howling storms, its pattering rain in summer, its untrodden, unpolluted snow in winter—how can one ever leave it voluntarily for the city with its smoke and dust, its noise and clamor, its struggle and strife, its jealousies and intrigues, its saloons and its brothels?

I thank God for the brave souls who are willing to tackle the city's problems, and try to purify its social and political atmosphere, and am sorry for the poor souls who have to live in the city because they can't get away from it. But for the man who has a country home, or can have one, and who voluntarily leaves it—well, I simply wonder at his mental make-up.

I know what there is to be said on the other side; but the telephone and the trolley, the magazine and the newspaper, are largely eliminating the isolation and lonliness of country life, and are promoting that wholesomest of cries: "Back to the farm!" —Onward.

The Calf Question.

An American packing house is credited with the statement that 8,000,000 calves were killed in the United States in 1911. The house further states that the average weight of these calves was 70 lbs., and if they had been kept alive for a year longer their average weight would have been 600 lbs.

This is given as one of the reasons for the present high price of beef, and, by inference, farmers are urged to hold their calves until these develop into beef. The fact is apparently overlooked that the majority of these calves are the product of cows which are kept for dairy purposes. The dairy farmer finds that there is more profit in selling his milk as milk, or using it for the production of butter or cheese, than there is in using it to feed calves. So long as the condition remains, and the condition promises to be a permanent one, so long will the procession of calves to the shambles continue. This movement is aided, too, by the fact that veal is bringing a higher price per pound than finished beef.

Berkshire Queries.

J. McD.—Are Berkshire pigs the best pigs to raise for marketing at about seven months of age? Are they as easily fed as the Yorkshire, and are they so prolific for breeding purposes? or would a cross be better? if so, which breeds?

This depends upon the market requirements. Lumbermen desire fresh, fat pork, fishermen desire salty, fat pork, miners desire fresh medium-fat pork. Cities and town to a greater extent each year demand the leaner

There is no earlier maturing breed than the Berkshire but generally the sows are not as prolific as those of the Yorkshire breeds.

Crossing is only allowable when it is practised with the special object of producing a fair quality of pork and at the same time getting large litters.

Where Cattle Run Wild.

W. Barton, of New Zealand, writing in Hoardjs Dairyman, says that he has 700 cows running on a ranch simply for the purpose of breeding beef cattle. Most of these are so wild that they can be approached only on horseback. Every year the old cows are culled out and sent off the ranch to be fattened on the farm for slaughter. Two of these old cows, which had never been broken to milk, showed signs of being in calf when brought in, and at nine years old they dropped calves and gave eight gallons of milk a day for a period of two months.

Tomato and Raspberry Training.

B. V. Egbert of Nercer county is a gardener and small fruit grower who has ideas of his own. He is a close observer, and goes to the plants with which he deals for instruction in handling. Some of his methods were picked up on the Pacific coast and have been adapted to eastern conditions. His method of pruning tomatoes is unusual and unique. He allows the plant to make four leaves, then clips off the top. If a cluster of buds has formed it makes no difference; they are not saved, as they seldom develop into perfect fruit. The effect of this topping is to cause four strong side branches to form, one in the axil of each leaf. On these branches a fruit cluster will develop in the axil of each third leaf. Three clusters are allowed to form on each branch, then the end of the branch is clipped off. This provides for 12 clusters of fruit, which Mr. Egbert finds to be all that the plant can mature. Side shoots which spring from the branches later are pinched off, leaving only the main framework of the plant and the leaves growing on it.

The important point is the effect this method of training has in hastening the ripening of the fruit. Mr. Egbert claims that while a plant allowed to mature its first cluster undisturbed may ripen a single fruit sooner than a plant pruned in this way, the pruned plant will be far ahead in the race of producing fruit to go on the market, and that by this means he reaps a handsome reward for his care in the higher price obtained for the crop.

He also holds some ideas of his own regarding intensive methods of growing red raspberries and blackberries He is not content to grow these plants by the ordinary method of hedgerows and self-supporting plants, but insists on keeping the plants in hills and not allowing more than six canes to each hill. He objects to a spreading, self-supporting bush, because it interferes with cultivation, and he believes that thorough cultivation throughout the growing and ripening period of the fruit as a means of maintaining the moisture supply is a matter of the utmost importance. He ties the canes to a trellis made of two wires strung on posts. The canes are allowed to grow tall, being left six feet in height, after being cut back. He finds that the young canes do not develop strong fruit buds until they get above the fruiting canes. In order to overcome this trouble and get well developed buds without too great height he bends the fruiting canes over and ties them to the wires, thus giving the young shoots a free field in which to develop.

Mr. Egbert estimates it costs him as much to grow one acre by this method as it would to grow two in the ordinary way, but he is confident that the greater yields more than repay the extra cost. He is after cheaper bushels and feels that this is the way he gets them. The thorough cultivation which he gives enables the plants to carry a crop through a drouth that cuts off the crop entirely on bushes as ordinarily grown.—Maine Farmer.

Rotates With Strawberries.

I have a piece of land with muck and sand mixed. I get best results with strawberries and cabbage, where the water is from 2 to 3 inches below the surface. I follow a system of rotation with my crops that I have found splendidly adapted to this soil. I plant strawberries two years, then plow and plant to fodder corn. The next year I put in a crop of potatoes, then grain with clover and timothy. I cut one crop, plow down the sec-

Forestall forgetfulness; taste this genuine tea-treat now. Your dealer offers it to you with this fair agreement:

Either you must like the flavor so well that you want to keep on drinking this tea by preference, or else you will please return the broken package and get your money back.

This is straight, unmistakable. A confident printed guarantee is on each 35c., 40c. and 50c. package. 40c. KING COLE is special value.

35, 40, and 50c. per lb.

HARROWS

In these days of expensive labor you can't afford to buy any harrow but the one which will do you work best and quickest—'twon't pay you.

Our Lever Harrow is a great one;—best there is going by long odds. It will harrow steadier, and just to what depth you want it. Then, you can regulate the draft on the horses and get the greatest amount of work for the least pulling.

A touch of the levers and the teeth are just where you want them at each round; not too deep at first, to ease the horses, then afterwards when the top soil is loose, throw them down and you're getting something done.

Saves time because less scrapes do.

Made in sizes 9 and 11 Tooth, Single Section, 15 and 17 Tooth Double Section.

Bailey-Underwood Co., Ltd., New Glasgow, N.S.

SEED OATS!

If the farmers of the Maritime Provinces, Quebec and Ontario want to make sure of getting the highest possible grade of seed oats for the Spring of 1913 apply to us at once. To prevent a repetition of the disaster that befell so many farmers last year by sowing devitalized grain, we have stored at Point Du Chene and Pictou 50,000 bushels of **large, selected, separated White Seed Oats, true to name and free from noxious weed seeds.** It will be the farmers own fault if they do not procure good seed as the extra yield of these oats pays twice over cost of the seed.

Our firm name is stencilled on every bag. Do not allow the dealers to give you other than Read's oats for seed.

JOSEPH READ & CO., LTD., Summerside, P. E. I.

ond crop, and plant strawberries. I use coarse manure for the potato crop, and fine manure for strawberries. I spread it thinly in the fall, previous to picking the first crop.

I have harvested 8000 quarts of strawberries per acre. They are of the Flint variety, and are the best paying crop that I grow. For every crop I grow I plow 8 to 10 inches deep, and harrow three or four times, or more, if necessary, to make a good seed bed. In planting early vegetables I plant spinach and radishes 32 inches apart, with a row of beets, parsnips, or a similar crop between. When spinach and radishes are harvested I go through the row with a horse, giving the remaining crop more room and at the same time saving the labor of a wheel hoe.—H. G Groat.

Orchard and Garden Notes.

Test all vegetable seeds as soon as they are received.

Calliopsis is a desirable quick growing annual for the cut-flower garden.

Go over the tools, put them in repair, and order any new ones needed for the summer's work.

Order plenty of sweetpea seed. There is no annual that is more appreciated than this.

Sow a few asters, pansies, cobea, and hardy carnations in the house the last of the month for earliest flowers outside.

The Senator Dunlap strawberry, Beta grape, King raspberry and Wealthy apple are good fruits for the garden. Plant liberally of each.

Lilac branches may sometimes be forced into bloom by cutting them and keeping in water in a cool, moist place, gradually giving more heat until the buds expand.

Plant out a few shrubs about the yard this spring. Spiraea Van Houttei, common lilac, Japanese lilac, Japanese rose, Mayday tree, mock orange and flowering currant are all good for the purpose.

Golden Bantam, sweet corn, Swiss-chard, Golden Self-blanching celery, purple eggplant, Kohl Rabi, White Japan muskmelon, Sweet Heart watermelon, are all vegetables that are worth trying.

Best Orchard Soil.

Deep, porous soil not only makes a good natural drainage, but is adapted to deep root systems essential to best results. The glacial drift soil so common in Maine in somewhat limited areas is the ideal soil for abundance of high-colored fruit. This soil, sometimes called granite soil, is composed of a light loam or sandy foundation more or less abundantly mixed with rocks of varying size, and is best adapted to orchards. Other soils give varying degrees of success, grading from the deep sandy or rocky loam as the best to the heavy clay at the foot of the list. The heavy clay is a hard medium to feed the tree through, and it also is a difficult soil to drain successfully for orchard work. The time has not yet arrived when heavy clay soil can be recommended for orcharding.—A. K. Gardiner, Maine.

"My little son had a very severe cold. I was recommended to try Chamberlain's Cough Remedy, and before a small bottle was finished he was as well as ever," writes Mrs. H. Silks, 29 Dowling Street, Sydney, Australia. This remedy is for sale by all dealers.

The Advantages of Oliver Plows

A REPUTATION for quality, such as is enjoyed by Oliver plows, is built up through many years of careful attention to details. No one of these details may seem very important of itself but the combination of many of them makes the difference between a plow that does good work and gives satisfactory service, and one that does not.

Your idea of satisfactory service is good plowing in Eastern Canadian fields and durability in the plow. This is exactly what you get when you buy an Oliver plow.

Fifty-Seven Years of Study and Practical Work Form the Basis of Oliver Plow Quality

Oliver plow designers are practical plowmen. Before an Oliver plow is offered for sale, the designers study all the conditions of the locality where that plow is to be used and construct a plow to meet them. The shape and construction of the share and the kind of material to be used; the construction of the frog; the amount and direction of beam landing adjustment; the strength and design of the frame; these are but a few of the points which are brought out by careful, thorough experimenting before an Oliver plow is ready for the market.

A reputation built up through more than half a century of constant, untiring effort for improvement, assures you of the full value of your money, both in good plowing and length of service, when you buy an Oliver plow. With all plowing problems worked out in advance, it is only necessary for you to tell the local agent what your needs and conditions are, and he can furnish at once an Oliver plow that will do your work the way you want it done.

See the I H C local agent, or, write the nearest branch house for catalogues and full information.

CANADA CEMENT COMPANY LIMITED PORTLAND CANADA CEMENT MONTREAL

Do You Know What This Label Means ?

It means cement of the highest possible quality.
It means cement tested by experts whose authority is final at all our mills.
It means cement acknowledged by engineers, architects and hundreds of thousands of farmers to fulfil every requirement of scientifically made Portland cement.
It means a cement that is absolutely reliable, whether used for a great bridge or for a concrete watering trough. You can use

Canada Cement

with complete confidence that your concrete work will be thoroughly satisfactory. You ought to have this confidence in the cement you use, because you have not the facilities for testing its qualities, such as are at the disposal of the engineers in charge of big contracting jobs.

These engineers know that when cement has passed the tests made upon it at Canada Cement mills, it will pass all their tests.

And this same cement is sold to you for your silo, your foundations, your feeding-floor, your milk-house or your watering-trough.

Used according to the directions in our free book "What the Farmer can do with Concrete," Canada Cement never fails to give satisfactory results. Write for the book. It not only tells you how to mix and place concrete, but will also suggest scores of uses for it on your farm, every one of them valuable to you. In asking for the book you do not incur the slightest obligation.

Ropy Milk.

Of the many abnormal changes which sometimes take place in milk one of the most common and persistent is that which gives rise to what is called "ropy'- or "slimy-' milk. Such milk, when poured from a jug, has a rope-like form. A spoon or wire dipped into the milk and then taken out draws after it thread-like strands sometimes more than a yard in length. Such an abnormal appearance naturally alarms the consumer, while the persistence of the trouble frequently causes great loss to the producer or retail seller. The ropiness which appears in the mixed milk of a herd several hours after milking, and which increases on allowing the milk to stand, is due to the growth of bacteria, which, as a general rule, gain access to the milk after it has left the udder of the cow, though in a few instances they may exist in the udder before milking. This kind of ropy milk, though abnormal and prejudicial from the seller's point of view, is quite wholesome, and does not endanger public health.

"GARGET" MILK.

Ropiness, however, is sometimes observed in milk from individual cows, notably in cases of inflammation of the udder. In such cases the cause may be either bacterial or non-bacterial. If the ropiness does not increase when the milk is kept and cannot be propagated by transference into another sample of fresh milk, it is probably due to the presence of fibrin and white corpsules from the blood, which form masses of slimy material in the milk. Such milk ("garget'- milk) may not cause other milk to become ropy, but organisms are present in the milk which may lead to infection being spread from one cow to another by the hands of the milker. For this reason prompt attention should be given to all cows suffering from this disease, and all sources of infection avoided. Milk of this nature should not be used for food. In this leaflet the description "ropy milk" is confined to the first type of milk referred to; the article does not deal with "garget" milk.

ROPY MILK ORGANISMS.

The organisms causing ropiness are very numerous and may be divided into two broad classes:—(1) Those which, in sterilized milk, possess the property of dissolving the casein, making a thick, honey-like solution when grown for some time. These organism tend to produce an alkaline reaction in the milk, though some produce a little acid. In general they require a large amount of oxygen. (2) Those which do not dissolve the casein, but which, by means of the acid they produce, precipitate it (these include certain ordinary lactic bacteria). The quantity of acid produced in milk by these organisms is in some cases very large. These organisms are able to grow much better without air than the other type.

TESTS FOR ROPINESS.

On the appearance of ropiness it should first be ascertained whether the outbreak is caused by bacteria by adding a few drops of the affected milk to some sound new milk in a clean glass. This glass should then be placed in a warm room and kept loosely covered to prevent dust getting in. The time taken for ropiness to appear should be noted, and is of the greatest importance from a practical point of view, since it can be assumed that ropiness which does not appear until after three days would not affect the sale of the milk. The cows should be examined, and samples taken in clean glasses from the milk of individual cows and from the mixed milk after straining, cooling, etc. The time taken in each case of ropiness to appear should be noted. To a glass of clean fresh milk from another source should be added some of the water used for washing the churns and pails, and to yet another glass some of the water which the cows drink. A glass of this milk should also be left exposed in the dairy. The results of these experiments would probably indicate the source of the trouble and the measures prescribed below for dealing with the discovered source of infection should be carried out. On an outbreak of ropiness, however, it would be as well to adopt the whole of the following precautions:—

PREVENTIVE AND REMEDIAL MEASURES.

The bacilli causing ropiness are frequently found in water. Special care

A Get-Rich-Quick Scheme

may be all right in some cases, but the majority of us have to practise economy daily if we ever want to be rich, or even comfortably well off.

More money is wasted in the kitchen than in any other part of the home. That is where economy should be practised, but without a good Stove it is impossible. If you use an

ENTERPRISE MONARCH STEEL RANGE

you will save in food, fuel and repair bills, (not to speak of time and labour) enough to pay for the range itself in from one to two years.

Remember, even 2c saved on one meal is 6c a day or nearly $22.00 a year—and the MONARCH will save you that all right.

We are preparing a very attractive booklet explaining how this is done and illustrating some of the many good features of this celebrated range. Send your name in early and we will reserve a copy for you.

should, therefore, be taken in washing the milking pails, strainer cloth, etc., after each milking. When thoroughly clean these should be well scalded, and should not again be rinsed with cold water. It is well to scald the pails, etc., shortly before milking. Great care should be taken that no water is splashed into the milk in the process of cooling, etc. Dust is also sometimes a carrier of the bacilli. The pails, etc., after washing should, therefore, be kept upside down, and the milk when it is in the pails shonld be kept covered as much as possible. The rooms where the milk is kept should be well cleaned. Wooden, cement or stone floors may be cleaned with a mixture of five parts of commercial sulphuric acid to ninety-five parts of water, but care should be taken that this does not get on the clothes of the person using it. Wooden vessels should not be used for milk, as they may persistently retain the ropy milk organisms. It is inadvisable to use wooden troughs even for washing milking vessels, but when they are used special care should be taken to clean them each time after use. Dilute solutions of washing soda favour the growth of organisms, and it would be better to use sddium hypochlorite or some other cleanser and disinfectant in cases of an outbreak of ropy milk. Straw, mouldy hay, and also butter. wort have been shown to hold ropy milk organisms, and the custom of wiping the udders of the cows with a wisp of straw before milking is a bad one. After washing their hands for milking, milkers should not handle straw or fodder, nor snould any such material be brought into the cow-barn just before or during milking. The organisms may be transferred to cows from water in which they have been standing, or which has otherwise been splashed on their flanks or udders. The cows should, therefore, be kept clean; and ponds should be fenced off so that the cows cannot wade in them. On the first indication of an outbreak of ropy milk the cows should, if possible, at once be turned into another pasture.—Leaflet of the Board of Agriculture.

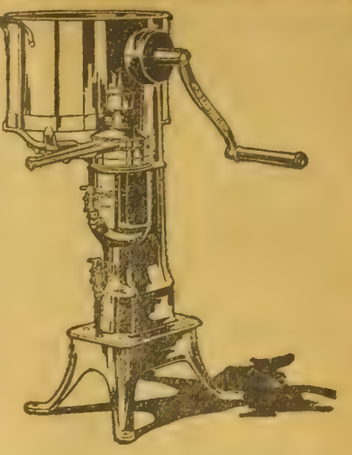
Disease in the Lambing Pen.

Dealing with the mortality associated with the lambing season, and the average percentage of deaths, Smith says:—"But the whole of the mortality does not necessarily occur as the result of difficult presentations; parturient fever is common, highly infectious, and spreads by means of the shepherd, the soiled surroundings, and the after-birth left in the pen. When this disease appears, the lambing pen must be at once broken up and destroyed; let it be set fire to, and the ground on which it stands thus disinfected." This is drastic treatment in the case of a permanent structure, and yet it cannot be effectively disinfected, and it is probably of no great use for any other purpose. Fresh ground is as desirable, indeed as necessary, for lambing ewes as for rearing pheasants and chickens, and those engaged in these industries know well enough how certainly disease makes its appearance if the same land is used for rearing birds for several seasons in succession. Hothouses are not needed for sheep, only protection from wet and cold, and some small degree of comfort, and thus permanent buildings may be generally regarded as superfluous. They may save the trouble of erecting a fresh temporary shelter every year, and be relatively cheaper in that the expense incurred is not an annual charge, but they are not economical if they are not healthy. The protection or shelter is needed only during a few nights prior to and a few days, indeed, a few hours, succeeding parturition, for as soon as the ewes are fairly recovered from the labor, and the lambs are strong enough on their legs, they are better out in the fields, and the rest is simply a matter of providing a sufficiency of suitable food, which means plenty of milk for the lambs. It is a great mistake, and one that there is often a tendency to commit, to keep ewes and lambs hanging about the lambing pens. Where there is attention to cleanliness, thorough ventilation without draft, and a free use of disinfectants, any risk of disease is reduced to a minimum, but where permanent buildings are used for lambing ewes, the floor, at least, should not be permanent, because it is the litter and the ground that absorb parturient products and septic material. The floor, at least, should be changed each year by digging it out and carting it away, replacing it with fresh material, preferably rubble, or freshly burnt earth, but there is, after all, nothing so safe as a fresh fold of fresh ground ehery year. —Veteran, in Farm Home.

Scouring Sheep

Scour in sheep, taking the form of diarrhoea or dysentery, is a trouble with which most experienced sheep-owners are familiar. Diarrhoea follows the ingestion of young, quickly-grown, succulent green food, where all animals consuming it are concerned, and in spring and in autumn, when they are put on aftermath, a relaxed state of the bowels is the rule in both bovines and ovines. Mountain sheep have commonly hard times during winter, and so very often do some others that are not mountain, and when the winter is through they are often thin, weak and debilitated. In such cases diarrhoea is more likely to go hardly with sheep than when the animals have been wintered well and are in fair condition. This is one of the reasons why the poor sheep perishes while the animal in better condition is not perceptibly affected. Dysentery, which ofeen supervenes on diarrhoea, carries off a great many sheep. In the case of sheep scouring on spring grass or aftermath, the indication is to counteract its effect by the provision of some dry, nutrient and slightly astringent food. Cotton-cake is the corrective of succulent grass most commomly employed. The medicinal treatment of diarrhoea and dysentery necessarily depends upon the cause, and, in dysentery more especially, on the stage that has been reached. "Scour" is not in itself a disease, but only a symptom, generally of some digestive disturbance brought about by dietetic errors. There is material for a book in the consideration of the diseases and disorders of which diarrhoea may be a prominent symptom, and the purging may arise primarily from exactly opposite conditions—too much dry astringent food which is commonly the beginning of dysentery, or too much succulent, laxative food, which may cause simply a relaxed state of the mucous membrane of the bowels and the passing of fluid faeces, and eventually terminate in dystntery. Any tendency to scouring on account of succulent or laxative food can be corrected by giving something that is dry and astringent. There are certain lands that cause scouring, and each case should be considered on its merits, for it is utterly impossible to provide a medicinal remedy that will suit all cases or fit all circumstances.

Pay the Price of the Best —No More—No Less



ECONOMY in buying a cream separator does not begin nor end with the price. You may easily pay too little and just as easily pay too much.

Learn the difference between gears that work without back lash and those that have it or develop it soon. Learn the importance of a self-adjusting bowl spindle bearing, and learn to know one when you see it. Discover the difference between brass and phosphor bronze as a material for bearings. Buy a separator with an oiling system that cannot fail you even for a few minutes of a run. When you find the separator that comes up to your specifications—one that with proper care will do good work for a long time—buy it. You will find it marked

I H C Cream Separator Dairymaid or Bluebell

I H C cream separators turn easily and they are easy to run because the working parts are accurately made and the bearings are sufficiently lubricated. The shafts and spindle are the strongest used in any separator. The shaft and spindle bearings are supported by the frame, but have no contact with it. The contact is between the steel spindles and phosphor bronze bushings. The gears are spirally cut so that there is no lost motion between them. They are entirely protected from grit and milk, and at the same time are easily accessible for cleaning.

See the I H C local agent and ask him to give you a demonstration of the efficiency of the machine as a skimmer and to go over with you and explain carefully all of its good, mechanical points. You can get catalogues and full information from him, or, write the nearest branch house.

In the Days of the First of the Georges

Trade names that have been established for fifty years in this country are few enough to be regarded as unique, and when we find one a hundred years old, it is singularly so. In the province of Nova Scotia there are two firms still in business that had their origin previous to 1790, and there are perhaps a few others in Canada, but not many. Probably the oldest trade name on this side of the water is that of Brandram. The firm of Brandram was established during the reigk of George I., and was therefore a well established trade name before the exciting days of Bonnie Prince Charlie.

But the name "Brandram is famous not only for its age as a business firm, but because of its connection with the product that bears its name. "Brnadram's" is a synonym for "quality" in white lead, and the reason for this is that through all the years of its history the policy and the practice of the Brandram firm has been to put its name on nothing but the best.

Brandram's White Lead was for many years supplied to the Canadian market solely from the home factory in England, but eventually as its reputation for quality grew, a Canadian factory was decided upon. Now "Brandram's B. B. Genuine White Lead" is made in the new corroding plant of Brandram-Henderson, Limited, Montreal, the finest white lead plant in America and one that was erected solely for making the Brandram product. Last year this factory corroded over 3000 tons and was unable to supply the demand. This year the output will be increased to about 4500 tons.

But Brandram-Henderson, Limited, are not only corroders of White Lead, they are also manufacturers of Brandram-Henderson English Paints, in which none but Brandram's B. B. Genuine White Lead is used. White Lead as our readers know is paint's first essential, in fact it is its most vital quality, and any paint that contains a sufficient quantity (70 per cent. of Brandram's B. B. Genuine White Lead is bound to be good, at least as far as White Lead is concerned. The base of Brandram-Henderson White Paint and colors is 30 percent oxide of zinc and 70 percent Brandram's B. B. Genuine.

About one hundred and eighty years have passed since the first Brandram was heard of in trade circles in England, and we think it may be taken for granted that "quality first" must have been his policy as it has been the policy of the firm during the past one hundred years of which manufacturing and sales records are obtainable. If it had not been his policy, it is doubtful if as a trade name "Brandram" would be alive to-day.

What a lesson the people of a young country like ours can draw from the history of the "Brandram" business. How it teaches us that whatever is worth doing is worth doing well, and that it is only the fit can hope to survive.

Your Summer Vacation.

A most interesting and well printed publication has just been issued by the Grand Trunk Railway System, dealing with the attractions of the well-known Algonquin National Park of Ontario, and copies may be had from any of their city ticket officers.

The territory dealt with is a thoroughly universal vacation one, combining high altitude, (200 ft.), pure air, unspoiled forest, beautiful lakes, splendid fishing, much wild game, hotel or camp life, in close touch with civilization or entirely apart from it, and satisfying alike to novice and veteran.

Included in this publication is a description of the "Nominigan Camp" situated on Smoke Lake, the centre of one of the finest fishing grounds in Canada, and which will be open for the first time this year with accommodation for 60 people. This idea of a log cabin camp is an innovation in Canada but one that has become most popular and attractive to a large number of summer playground seekers in the Rangeley Lakes, Me. Good hotel accommodation is offered at the "Highland Inn" and the rates are most reasonable.

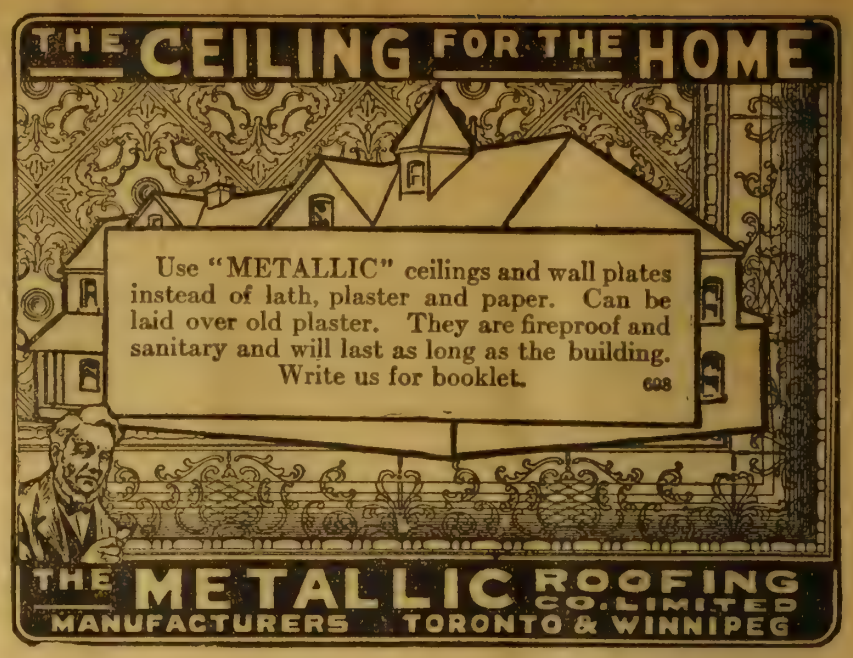
The publication is well written and the map that accompanies same gives one a good idea of the 2,500,000 acres that are found within the Park boundaries.

"Wolf Teeth" in Horses

There are a variety of causes for blindness in horses, but wolf teeth are not chargeable, in spite of a common belief to the contrary. These teeth are vestiges of the seventh molar or premolar teeth of the prehistoric horse. The modern horse has six large grinding teeth in the upper and lower jaws on both sides of the mouth, or twenty-four in all. The three grinders nearest the front of the mouth are called premolars, and the wolf teeth, if kresent in front of these three, would be called anterior molars. The hog has four of these teeth, and the prehistoric horse had them, but through evolution they have disappeared. Sometimes, however, we find vestigal anterior premolar teeth in the upper jaw of the horse, and these are so-called wolf teeth, and are of no importance whatever. They do not cause moon blindness (periodic opthalmia) or any weakness of the eyes. Occasionally they get in the way of the bit of the over-head-check-lines, and where that is so they may be extracted; otherwise they may be let alone, and often they drop out as the horse ages. A horse may have a foreign body under an eyelid or the membrana nictitans (haw of eye), and it should be located and removed; or the animal may have periodic opthalmia, which is incurable, and will end in total blindness of one or both eyes. The tendency to this disease is considered hereditary, so that an affected mare or stallion should not be used for breeding.—American Farm Journal.

Lampers in Horses.

The barbarous custom of firing a horse's mouth as a cure for lampers has fortunately been discarded for a more humane remedy. A horse so affected should be given a good dose of laxative medicine, such as ½ pint of linseed oil to regulate the bowels, and one of the following powders might be given in the feed once daily and be continued for a week:—Powdered nitrate of potash, 2 drachms; powered flowers of sulphur, 2 drachms; powered aniseed, 4 drachms. The diet should consist of soft, easily-digested food, green food if procurable. An occasional bran mash will be found beneficial, but no oats or corn should be fed.



FLORICULTURE.

After Easter Lilies are done blooming cut the stalk off about one foot from the pot gradually withdraw, water until the leaves wither and the soil becomes thoroughly dry, then set the plant, pot and all in some dry, cool room until September, when the bulbs may be repotted.

Spirea may be planted in a garden when done blooming in a sunny situation, where the drainage is good it can be divided and planted for forcing next fall, if desired, or it will winter in the ground with protection.

Never allow your Azaleas to become entirely dry. It would almost surely kill them. The calyx or bottom of the blossom should be pinched off close to the foliage as soon as the flower falls or otherwise the new growth will be much retarded.

Violets grown in pots require very little sunshine but plenty of light and moisture, also perfect drainage.

All plants that need repotting should receive attention now.

It is an especially good time to repot palms and ferns. Get good light soil that has plenty of decayed grass in it and repot into pots one size larger. Be sure to use broken pots or some rough material for drainage;

If you propose to have any painting done in your rooms this spring, see that plants are placed in some room that can be aired and that will not be exposed to the odor of paints. Turpentine is very bad for all sorts of plants, ferns being especially liable to damage therefrom.

Don't uncover hardy stuff in the garden yet, it is too early except in the most sheltered spots.

Straw should be loosened up on the bulb beds and a portion of the same removed, but not all.

Plant Sweet Peas for early bloom now. If the ground is very cold and wet, put a little horse manure, about two inches under the seed, manure must be covered with soil before seed is sown. Sow plenty of seed even if you have to thin them out afterwards.

As to the vine grown in boxes, I would highly recommend the Bignonia Radicans or Scarlet Trumpet Flower. It grows rapidly, peoducing a quantity of large dark red trumpet snaped flowers with an orange tint. Growing it in boxes which can be cellared in the winter all danger of winter killing would be avoided. I do not think you could get a better plant under your special circumstances.

The boxes should be about eight inches wide and eighteen inches deep and about two feet long with drainage holes in the bottom, covered with broken flower pots or stones to prevent clogging.

Plant Aster seeds for earliest use now, first of April. Try a few of the Honhenzollen type, if you have not already done so. Ricinus or Castor Oil Beans planted now one in a small pot will make pretty ornamental leaved plants for summer use. They should not be put out of doors before the last of June, however, as they do not like cold nights.

IHC Wagons Are Tough

DID you ever notice, when one of the wheels of your loaded wagon dropped into a rut or bumped over a stone, how the seat springs gave and rebounded, almost throwing you off? That is an indication of the shock and strain that the rigid spokes and axles have to stand whenever the wagon is traveling over a rough road or through a field. Even on a smooth road there is always the crushing strain of the load, affecting every part from the top box to the lowest point of the tire. I H C wagons

Petrolia Chatham

take these stresses and strains as a matter of course. They are made to stand just that sort of work. From neckyoke to tail board they are built of selected, air-dried lumber, strong and tough, bending to strains but coming back as straight and true as ever when the load is removed. Besides being tough, I H C wagons are light running. The wheels have just the right pitch and gather, and run true. All skeins and skein boxes are paired. The running gear is assembled by skilled workmen whose wages depend as much on the quality as on the quantity of the work they turn out. Machine work, being more uniform and a great deal faster, takes the place of hand work wherever possible. Consequently, I H C wagons are practically all of the same high standard of quality throughout.

You cannot do better than to equip your farm with I H C wagons. The I H C local agent sells the wagon best suited to your work and your conditions. See the wagon at his place of business and get catalogues and literature from him, or, address your request to the nearest branch house.

Does the Maritime Farmer Know?

Do you know ? Does your family know that here stands a $000,000 Store between you and the West and nearer to your home by 24 hours each way ?

A Store that is ready to supply you with Household Merchandise of sturdy character and ready to clothe every member of the family with apparel which, we believe to be as good and perhaps just a little better and which we know to be at least different from that which your neighbors have secured elsewhere ;—

There is no woman who likes to wear a style that is so common that everybody else has it.

Send to Goodwins and get something different ;—We will save you money, guarantee you satisfaction and pay Express or Mail charges--both ways if necessary

Send today for our beautifully illustrated Catalogue ;—It is free !

Methods of Improving the Supply of Field Root and Vegetable Seed.

Continued from page 527)

GENUINENESS OF SEED STOCK.

To test seeds as to their trueness to kind and their quality in respect to breeding and selection, growing tests on trial plots have to be made. This third, and important branch of seed testing that we have been unable to take up except in a preliminary way for the results of the preliminary trial plot tests with field root seeds that have been presented to you in the paper by Mr. Eddy. We are indebted in a large measure to the Director of Experimental Farms, who although somewhat cramped for land space, kindly placed at our disposal both land and labour for cultivating it. Three acres of land in these trial plot tests has produced some highly interesting results, which however should be confirmed by repeated trials of a series of years before we could consider ourselves warranted in making definite statements that make or mar the reputation of a seedsman.

From the results of two years tests we have been able to form some opinion as to which of the seedsmen are most skillful in coining new and attractive names for established sorts that are already on the market under a multiplicity of names. To say that to catalogue five or six distinct varieties under ten or twelve variety names was done for the purpose of flim-flaming the farmers and gardeners would be unfair to the seedsmen. When a certain popular kind and variety of seed is known under variety names that differ in different districts it is a matter of business to insert in the catalogue all of the variety names under which seed is commonly known. The mixture of varieties and mongrel nature of the crop produced from the seeds of some of the stocks that were imported, is a matter of much greater importance than the multiplicity of variety names. There can be no excuse for the importation of some of the mongrel seed stocks put on the retail market unless it be to supply the demand from growers who want cheap seeds.

Our experience with grass and clover seeds has been that when farmers know they are getting No. 1 grade they are willing to pay a fair price for it and I believe that the only practical way of suppressing the importation and distribution of cheap inferior qualities of field root and garden seeds is to conduct trial plot investigation work from year to year and as soon as definite information of unquestionable accuracy is available to give that information to the public in a form so that farmers and gardeners may readily know which of the seeds and which of the seedsmen are the best, and which are unreliable. A simple reference catalogue giving the results of such trial plot tests over a series of years together with accurate illustration of variety and type forms, and the names by which they are properly known should prove of much value to Canadian farmers and gardeners. Such a publication issued every two or three years would be of real benefit to good reliable seed houses, and equally injurious to importers of inferior or worthless stocks that may be bought at low price from unreliable growers or seed brokers of foreign countries.

SHOULD SEED GROWING IN CANADA BE ENCOURAGED.

The matter of providing special encouragement to growers of field root and garden vegetable seeds is under consideration. In Europe the breeding and selection of plants to secure excellence of kind is done by private interests. In Canada we will have to look to the plant breeding specialists employed on the staff of the various experiment stations to produce elite stock seeds of the various kinds and varieties that may prove to be best adapted to our soil and climatic conditions and purposes. We have a few good farmers and gardeners in the principal localities where seeds from these crops may be grown successfully who would be quite competent to maintain excellence of quality under the inspection and direction of this association while increasing the supply in quantity for commerce. It has been suggested that it would be advisable to offer such prospective seed growers some special encouragement in the nature of a bonus amounting to approximately one-eighth of the average retail price for the different kinds to be paid to them under proper regulations, and according to the amount of seeds they produce. The principal envolved in paying bonuses for such purposes is one that is not generally popular. My experience leads me to believe that to create a supply of high class root and vegetable seeds by this means would be a slow process, and any monies expended for that purpose, nominally in the form af a bonus, should really be considered as an expenditure for educational work in seed growing. The question is one that is deserving of careful consideration.

FIELD COMPETITIONS IN ROOT AND VEGETABLE CROPS.

Field crop competitions with seed producing crops such as wheat, oats and potatoes have had a splendid influence in stimulating to greater interest in the advantages to be derived from improved cultural methods and the use of superior seeds. There can be no doubt that equally good results are to be obtained from extending those competitions to field root and garden vegetable crops.

IMPROVEMENT MUST COME FROM DEMAND FOR GOOD SEED.

That there is abundant opportunity for improvement in the supply of field root and garden vegetable seeds there is ample evidence. The seedsmen as a class are less to be condemned for the condition of the supply than are the farmers and gardeners who want cheap seeds. None of the seedsmen are faultless and all, or nearly all of them have some good points in their favour.

"There is so much that is good in the worst of them, and so much that is bad in the best of them, that it ill becomes any of them to talk about the rest of them." We must look for improvement in the seed supply mainly through educating farmers and gardeners to demand only the best, and that it is of the worst kind of false economy to use inferior seeds no matter how cheap they may be had. It is also our opportunity and duty to provide the means, so far as possible, whereby they may know where they are getting the best and how to guard against purchasing the inferior article. It is an exceedingly difficult problem that is not impossible of solution. The results that may be obtained from the use of better seed, over the aggregate area under cultivation in these crops, is well worth the best efforts that can be directed to that end.—Geo. H. Clark, Seed Commissioner.

The Ayrshire Association Grant to Chatham Exhibition.

Editor Maritime Farmer:

In your issue of February 25th you stated that the Ayrshire Association grant to Chatham Exhibition was $25.00. Please correct as the grant in question is $50.00, same as to Fredericton, Halifax and Charlottetown.

Care of Milk and Cream on the Farm.

Many dairymen do not realize the interdependence between the creamery and the cream producer. Good butter cannot be made from an inferior grade of cream. The better the quality of the butter produced the greater will be the demand. The higher grade butter demands the highest price, even when the market is well stocked with the lower and cheaper grades. If the creamery is forced to sell at a lower price, owing to the poor grade of butter produced, it follows that the creamery cannot pay as much for the butterfat. Dairymen lose thousands of dollars annually, due to the lower price paid for poor butter.

It is not easy to say what is the most important feature in the production of clean milk. Special stress may be placed upon some particular step, yet if carelessness is allowed to rule at other steps, much of the most painstaking care would count for naught in the final results. Clean and sanitary conditions are factors of first importance upon which too much stress cannot be laid. It is impossible to produce good milk or good cream if dirt of any kind is allowed to get into it. The amount of dirt that gets into the milk is one of the chief causes of its rapid spoiling. Although some farmers think that the creameryman can in some mysterious way remove the dirt and all its attendant evils it remains a fact that the contamination resulting from dissolved filth cannot be entirely eliminated.

The author describes utensils, as milking pails and coolers and the sanitary arrangement of the milk house, drawings being used to illustrate his points. He also shows a pit or milk well that has been found quite satisfactory as a storage place for dairy products in the absence of ice or running cold water. He shmmarizes his instructions as follows:

It is impossible to produce clean milk and cream unless the cows, stable, milker, utensils and separator are clean.

To wash milk utensils use, first, cold water for rinsing; second, warm water containing a small quantity of good washing powder, for cleaning; third, boiling water or steam for sterilizing.

Use a metallic strainer; it is practically impossible to keep cloth strainers sweet and clean and free from bacteria.

Skim the milk as soon after milking as possible, and cool the cream at once.

Skim a cream testing from 35 to 45 per cent.—the richer the cream the better it will keep. By skimming a rich cream, more skim milk is left at home for feed, and there is also smaller bulk on which to pay express charges.

Do not mix warm, new cream with cold cream until it has been cooled.

Keep the cans of cream in a tank of cold water until time of delivery.

Wash the separator thoroughly after each separation.

Deliver the cream to the creamery

or cream station early in the morning.

Deliver the cream not less than three times a week during the summer, and twice a week during the winter.

Protect the cans of cream from the sun by covering with canvas or with a wet sack while en route.

Blown Sheep.

The condition known as hoven or "blown," although not so frequent in sheep as in cattle, is quite as urgent in its demand for immediate relief. The causes are also much the same—abrupt changes of diet, particularly to quickly-grown, succulent or wet green food. The rapid transference of material of this kind to the rumen places it under conditions favorable to rapid fermentation, and during fermentation gases are given off more rapidly than they can be dealt with through the ordinary channels of escape. In summer clover is the material most likely to cause "hoven", but any wet green stuff may do so. The symptoms are not difficult to recognize, and there is the same expression of pain, unwillingness to move, affected breathing, and distension of the rumen with gas, characteristic of the condition in the bovine. The drum-like swelling on the left side, which gives a resonant sound when tapped with the fingers, is conclusive of the nature of the trouble. Sheep, except in the case of a few pedigree animals, being of small commercial value, are not generally treated professionally, unless there is a wholesale outbreak of disease, and the shepherd of the flock is generally also its doctor; but, even if the vet. were usually employed, there is no time to send three or four miles for a peterinary surgeon, and thus the means of treatment should be kept in readiness for use in emergencies. "That, thou doest, do qdickly," or it will be useless to attempt to do anything. Anti-ferments and stimulants are the agents to be given and there is no better medicine than ammonia in combination with ginger and Epsom salts. The average dose of carbonate of ammonia—the form most generally available, is half a drachm dissolved in water, gruel, or ale. Other agents sometimes given are chloride of lime, chlorate of potash, bicarbonate of potash, bicarbonate of soda, hyposulphite of soda and carbolic acid; but, if at hand, the best results may be looked for from ammonia. Stomachics and tonics are indicated after relief from the distention by gas has been afforded, in order to restore tone to the organ, and the animal must for a time be most carefully fed. If medicine does not relieve, or there is imminent danger of the sheep dying before it can act, such as when the distension is enormous and the brain is affected in sympathy with the disordered stomach, we must depart from the rule of first removing the cause and gain time by puncturing the rumen. The pocket-knife may be used for this purpose, and it is generally the handiest weapon for stabbing; but it is not the best instrument to employ, since, owing to the churning motion of the rumen, the wound in it will, as the gas escapes, be removed from apposition with that in the skin and abdominal wall, and the escape of gas be permanently stopped, if it does not result in some of the contents of the stomach falling into the abdomen. The proper instrument to use is the trocar and cannula, the tube of which keeps the wounds in juxtaposition and provides for a free escape of gas. As an illustration of the safety and absence of risk when the operation is performed with this instrument, Youatt records a case in which he punctured the rumen seven times in four days, the sheep eventually recovering.

Growing and Ensilling Corn.

The lack of confidence in the value and use of corn ensilage is gradually being overcome. According to Mr. J. H. Grisdale, Director of Experimental Farms, who has tested the matter in many parts of the Dominion, corn for forage or ensilage can be grown to advantage in almost all parts of Canada occupied by stock farmers. Failure to secure satisfactory results has often been due to wrong cultural methods practiced, or unsuitable varieties grown, rather than to adverse climatic conditions.

In order to secure for the benefit of stock growers generally reliable information on the subject of corn ensilage, Mr. Grisdale was summoned by the Select Standing Committee of the House of Commons on Agriculture and Colonization, to give evidence based on his experiments and observation. This evidence was printed in a pamphlet of sixteen pages and sent out in large numbers but there still available for distribution a number of copies in the hands of the Publications Branch of the Department of Agriculture at Ottawa.

Corn will do well in almost any kind of soil provided with good drainage and well prepared. Barn-yard manure, which may be applied during the winter or spring, is the best fertilizing material to use. From the middle to the end of May, according to the weather and soil conditions, is said to be the proper time to plant the seed which may be put in hills or rows. After describing the necessary cultural operations, varieties suitable for various provinces and districts are named. For the more northerly latitudes Longfellow, Comkton's Early, Angel of Midnight, North Dakota Flint and Sanford are recommended. Harvesting and ensiling are fully described and feeding is dealt with also. For feeding young stock some bran and clover hay should be added to the silage. Rations are given for all classes of cattle.

In discussing silos a table is embodied which shows the capacities of those of different dimensions. A hundred ton circular silo is shown to be 27 feet deep and 16 feet inside diameter. Silos of different materials are dealt with and their construction described. Cement silos properly constructed are referred to as being probably more durable and satisfactory than those built of wood.

Warts on Cows Teats.

A trouble which the milker has sometimes to deal with is that of chaps and warts on cows' teats. Warts appear on any part of the animal, and wherever situated, always detract from the appearance of the animal. In all cases warts are a disfigurement, and the majority of them prove a great inconvenience, especially when they form on parts where most offensive, such as the teats or lips. Some stockmen appear to take practically no notice of warts, and allow them to grow to great sizes on the cows. This is a sign of great carelessness on the part of the person in charge of the cows, as the larger the warts are and longer they have been growing, the more difficult will their removal be. In this case it is painful to the cow when milked, therefore warts and chaps should be got rid of as soon as possible. Many people fail to get rid of warts because they think it can only be done with great difficulty or by tearing the wart bodily away, but this is not the case. When cows are milked twice a day it does not seem to afford much opportunity to get rid of warts. To use any substance of a poisonous nature for the wart is dangerous in many ways. When the teats are chapped only, some kind of soothing ointment should be applied, and for this purpose carbolized vaseline, and other preparations may be procured from the chemist. This will heal the teat up in a short time, and allow the milking to be carried on without any discomfiture to the cow. In the case of warts when small they can be generally got rid of by touching them with caustic soda. Another simple remedy, and one which in many cases has been found to be successful; rub the wart with vinegar, then while it is still wet dust it with dry carbonate of soda. If this is done after each milking, the warts will gradually get smaller, and finally disappear. —C. W. Walker-Tisdale.

Every one that leads others to read and keep up with progress is a true benefactor to man. Only those who keep up with the world's progress can hope to hold their own in the struggle of life. Let us induce others to keep up with the procession.

Amatite ROOFING Needs No Painting

AMATITE is made of pitch, and it makes an ideal roof. There are two layers of this wonderful waterproofing material in Amatite.

The wearing surface is composed of a pitch-concrete made by embedding crushed mineral matter into a tough pitch matrix.

Rain has no more effect on the pitch than it has on the mineral, and year after year Amatite roofs give perfect service without any paint or care.

If you are a practical man and know what a nuisance and expense roof painting is, you know the value of a "no-paint" roof.

Amatite comes in handy rolls with nails and cement free. Skilled labor is needless. You can lay the roof yourself.

Look into the subject. We will supply you with sample without charge or obligation. *Address our nearest office.*

Creonoid *Lice Destroyer and Cow Spray*
Creonoid sprayed on cows keeps away flies. Use it before milking and cows will yield better.

Everjet Elastic Paint
Save money by using this black paint wherever the color is no objection. Elastic, heat-proof, durable. Use it for "rubber" roofings and all exposed iron and wood.

Pure Bred Poultry for Profit.

(Continued from page 539)

circumstances and fancy, I procured a trio of good white Wyandottes. Shortly afterwards I got four more pullets of the same breed and later I bought 12 high grade Barred Plymouth Rocks.

As I had a nice white Wyandotte cockerel I penned the Wyandottes by themselves anh saved the most uniform eggs for hatching purposes. By the 25th of April I had set the first hen and by the fourth of May I had seventy-five eggs under five hens which hatched out seventy-two nice chicks which I raised until fall.

In October I made some fattening crates in which to put the cockerels to fatten. In five or six weeks I killed them and sent them (over 200 lbs. in all) to Halifax and received 18 cencs per lb. Some of the birds dressed from five to six pounds.

As I had to buy all the feed for them, I kept a strict account of every item and by December 31st I found that I had a nice little profit.

I selected three of the best hens and twenzy-four nice pullets which commenced to lay on January 10th, 1911. From these I raised 68 chicks and in the fall the cockerels were prepared and sold as before but for 20 cents per pound. On December 31st my profit was $36.00 over cost of feed.

In 1912 I had a flock of thirty, twenty-five of which were pullets. I only raised fourteen chicks, seven of which dressed 33 pounds in October and sold for 20 cents per pound. The hens laid 336 dozen eggs and by December 31st, I had a profit of $46.00 Each hen earned over $1.50 over and above her feed and care.

If I could have got the prevailing prices for eggs in Springhill or Amherst I could have done much better.

I purpose continuing with hens and believe I can make them earn over $2.00 per head over and above expenses. I have now as fine a flock of White Wyandottes as I think one can find anywhere in Nova Scotia or perhaps in the whole of the Maritime Provinces. My flock is headed by a nice cockerel, one of the blocky style, which weighed eleven pounds in December, 1912. I now have two hens coming off with twenty-five chicks from twenty-six eggs. In the face of numerous evidences of this kind I often hear people say that pure bred stock is no good and that they are more weakly and not so thrifty as crosses and mongrels. For my part, I have no use for either a mongrel or a cross, if it can at all be avoided.

I often think of a statement that Prof. Hare, of the Poultry Division, Ottawa, made at a Nova Scotia Farmers' Association meeting at Windsor, N. S., some years ago. He said: "People wonder why their hens don't lay. If one were to look at their flocks he would find a combination of all the different breeds of hens that has ever been known to mankind since Noah's Ark moved to Mount Ararat."

My advice to any person beginning with poultry is: get good pure breds of whatever kind you fancy and select the very best from these. Then subscribe for the Maritime Farmer and through its columns keep in touch with the methods practiced by other successful poultrymen. By following this advice you will be able to make the henery one of the most paying farm assets.—J. H. Carter, South Pugwash, Cum. Co., N. S.

Egg Dealers Plan Radical Change

That the system known as the "case count which has prevailed in the egg trade for a number of years provides no discrimination whatever, and that under it the producer, with no reflection on the hen, is not encouraged to market an article of high quality, was the decision come to yesterday afternoon in the rooms of the Board of Trade at a largely attended meeting of the egg trade of the Provinces of Ontario and Quebec. The remedy for this state of affairs was suggested as taking the form of an Eggs Marks Act, similar to the act governing fruit. The formation of a new produce association was also proposed.

Determining means whereby consumers and merchants could be protected against the marketing of stale and rotten eggs was the primary object of the meeting. Under the present system when bad eggs are found in the cases there is no recourse for the dealer to take, and the opinion of the meeting was that the "case count"—where a flat rate is quoted, stale and bad eggs commanding just as high a price as those of the highest grade—is equivalent to placing a premium on careless and dilatory methods in the productian and care of this product. Moreover, it was pointed out that the country storekeepers received no encouragement to market an article of high quality.

The opinion was unanimous that legislation should be secured to prevent the sale of such products and full approval was given to the proposal to adopt a new system whereby due discrimination should be made between good and bad eggs. The following resolutions were unanimously adopted:—

Resolved, "That it is the concensus of opinion of those assembled in this meeting that the greatest need of the Canadian egg trade at the present time is the passage by the Federal Parliament of an Egg Marks Act, similiar to the Fruit Marks Act; such act to make unlawful the buying, selling or trading in rotten eggs and to include such other regulations as may be thought advisable to promote the best interests of all concerned.

Resolved, "That the egg dealers assembled here unanimously approve of the proposal to change on June 1, 1913, from the present system of buying eggs to a system of buying only on the basis of quality, and further, we disapprove of paying for any rotten eggs in our receipts after that date.

Resolved, "That the chairman appoint a committee to draft a constitution and to take steps in conjunction with the trade in other provinces to form an association to be known as "The Canadian Produce Association" with a view to bringing together the city and county wholesale produce dealers, and further, that a meeting be called in Toronto at an early date to give effect to this resolution.

Representing the Federal and Provincial Government the following officials attended at the request of the trade: Mr. W. A. Brown, Live Stock Department, Ottawa; Mr. J. H. Hare, Live Stock Department, Ottawa; Mr. F. C. Elford, poultry manager, Experimental Farm, Ottawa; and Professor W. R. Graham, of Guelph.

The efficacy and the imperative need of a system of payment based upon quality was set forth by these speakers. Their proposal was followed by continued and animated discussion, but through it all it was clear that the majority of the meeting was heartily in sympathy with

BON-TON

$14.95 buys this Tailor-made Suit

The ladies' suit, illustrated, is one of many in the new Bon-Ton 1913 Spring and Summer Catalogue which shows many stylish suits and unusual bargains. Reference to newest style books, or latest fashion plates of highest priced tailors, in the leading fashion centres, will convince you that the suit illustrated is cut and made along the most fashionable and most correct lines. The material is fine quality imported whipcord in black, navy blue, royal blue, grey or brown—the most stylish material of the coming season. This suit is strictly tailor-made. Coat is 27 inches long and made in semi-loose effect at back with the new cut away style in front. The fashionable rolling collar and revers are carefully tailored. Cuffs and back of coat are ornamented with handsome buttons. Coat is lined with a good quality silk serge giving the garment a very dressy appearance. The skirt has two gores with high belt and back stitched with side plait in centre. Front drapes perfectly with buttons trimmings on both sides. Material, fit style and finish considered, this suit cannot be duplicated in Canada for the price.. **$14.95**

So confident are we of giving satisfaction that, if the suit does not in every way come up to your expectations, you may return it at our expense and get your money back.

If this suit is not what you need we have others and a full range of Ladies, Misses and Childrens overwear and underwear, so send today for the new 1913 Bon-Ton Spring and Summer Catalogue.

Advantages of shopping through the Bon-Ton Catalogue.

Think of sitting down in the evening, in a comfortable chair, at your home, and doing your shopping! That is all you do when you buy through the Bon-Ton Catalogue. Not only do you buy in comfort, but, what you do buy, you pay less for than if you shopped in the largest city departmental stores and yet you get your clothes tailored on the newest and most fashionable lines. Naturally, buying direct from the factory, through the Bon-Ton Catalogue, you save all the intermediate profits which are added to the price when shopping in a store. All goods bought through the Bon-Ton Catalogue are delivered to you by mail or express without extra charge.

We guarantee every article in the Bon-Ton Catalogue and, in the event of anything bought not being up to your expectations, send it back at our expense and get your money back.

FREE The Spring and Summer 1913 Bon-Ton catalogue, should be in every home. It's a style book showing you what fashionably dressed women are wearing and is indispensable to every woman as a reference book. It costs you nothing as your name and address on a post card brings it you free,—send for it to-day.

THE BON-TON COMPANY,
435 St. Joseph St., - Quebec, P. Q.

912

this or any other measure that would enable the producers and handlers of this product to curtail, or if possible, entirely eliminate, the enormous and needless loss due to the marketing of bad and deteriorated eggs.

It was further pointed out by certain members present that it would certainly be unwise not to take advantage of the experience gained by a number of the States, notably Kansas and Michigan. What was proposed at the meeting had already been worked out in a practical way in these States with the result of very greatly conserving this valuable product by eliminating needless loss and thus making the poultry enterprises more remunerative for the producer and the price of the product cheaper and its quality more dependable for the consumer.—Extract from "Montreal Gazette."

Home Made Plank Roller.

J. McD.—I intend making a land roller out of plank, and do not wish to have it draw harder than a solid hardwood roller about fifteen inches in diameter and about five feet long. What plan would you suggest building it out of hardwood plank? How thick and how wide would plank be required? What material would be required for frameword? How would axles be placed. I would also like to have a seat on it. A mowing machine seat would be suitable.

Ans.—About twelve years ago, the writer made a plank roller that is still doing good service. The roller was made about 33 inches in diameter as follows:

Take four pieces of hardwood plank 2 ft. 6 ins. long, from six to eight inches wide and one and one-half or two in thickness. Put in the form of a square and halving where the ends come together. Then take two pieces of the same length, from three to four inches in width and of the same thickness and halve them into each other at the centre in the form of a cross. Halve the centre of each side of the square already formed on the reverse side from that halved at the ends, making the mortise the exact width of the cross sticks you have put together. Next halve the ends of the cross sticks referred to also on the side reversed from that halved at the centre. If the work is carefully done you will find that the various parts will go together very nicely and will fairly lock in position. Put two or three quarter inch dowels in each corner and where the cross sticks are mortised. You now have a square with four spokes in it. Now strike a thirty-inch circle using the centre of where the spokes cross as your centre point. Next trim off the corners following your circle as closely as possible and you will have formed a very rigid four spoke wheel. If you make a one-piece roller you will only require two of these wheels. You will also require to make two or three rims as above described, but without spokes to use as reinforcements for your roller to be placed at equal distances between heads of roller. For staves I used hardwood strips two inches wide and one and one-quarter inches thick. I levelled the pieces slightly on the side next the form on which they were nailed. I used ordinary 12 d. nails, one at each place where a stave and heads or reinforcements come together. I got the blacksmith to shrink three hoops made from old wagon tires on the staves, one at each end and one at the centre and it is today as rigid as when it was first made and although it has been in use for twelve seasons it looks as if it were good for at least twelve more. The blacksmith also made two iron crosses with a one-inch hole in the centre, which were bolted at the centres where the spokes crossed. A one-inch iron iron bar was then run through these crosses to form an axle.

The blacksmith also made a pair of standards with a loop in one end to go over the ends of the axle and about 20 inches in length, divided about the loop and turned at right angles at the proper height and bolted to an eight inch plank which ran the whole length of the roller and extended about six inches beyond each end.

A mowing or raking machine seat was then bolted at the centre of this plank. The pole or shafts were also bolted to this plank and braced to suit.

The writer made his roller in one piece, but if he were to build another he would make it in at least two sections as a section roller turns nicer at the corners and does not tear up the seed bed.

A splendid roller may be made in the same way by taking four old mowing machine wheels of equal diameter. Get the blacksmith to drill holes in the rims for you and bolt the staves on them with small tire bolts.

Rockview Farm, the Home of Classy Holsteins.

(Continued from page 533)

26.30 pounds of butter fat in seven days.

Backed by such ancestry, it is no wonder that the little beauty is developing into such an animal of promise. Although not old enough to breed she is now showing a wealth of tortuous milk veins and a little udder so well developed and with such nicely placed teats that if one were to close his eyes and feel he would naturally suppose that the heifer had been bred and was springing.

Mr. Harding is a brother of Harding Bros. of Wish-ton-Wish Farm and as the two farms are only a few miles apart he uses the Wish-ton-Wish bulls Schuling Sir Posch, twice grand champion at Toronto and Sir Mersena Faforit Lad, a winner of first prizes and championships at Maritime shows. The thrifty young calves that our representatives saw in their pens in the Rockview stables were sired by these bulls.

Since Mr. Harding took over Rockview Farm its fertility has been systematically increased but as it is only a small holding and pasture room is limited he will be obliged to increase his acreage in order to make room for the natural increase in his herd.

While the Rockview stables make no claim for protentious dimensions, they can go one better than the average: they are kept scrupulously clean, are well ventilated and there is an abundance of light, factors that tend to the health and comfort of the stock.

A strict record is kept of the producing achievements of the various animals and when a purchaser inquires for stock, Mr. Harding is ready and willing to give the facts and figuress for which the discerning buyer will always inquire.

There are four little Hardings in the Rockview Farm home. They are all interested in their father's herd and although Holstein names are not the easiest in the world to spell they can spell the names of every individual in the herd, although they are only able to yet lisp their alphabet.

DISPERSION SALE OF

High Class and Show Ayrshires

We purpose dispersing our entire herd of pure bred and Grade Ayrshires now on our farm at

FOREST GLEN, Westmorland Co., N. B., on

Friday and Saturday, May 23 & 24

A strict record has been kept of each and every cow in the herd and as the food consumed by each cow has been charged against her production, boarders were quickly spotted and disposed of. This rigorous record keeping and weeding has brought the herd up to a good average producing capacity.

Terms: Under $50.00 Cash. Over that amount notes will be accepted with approved security, bearing interest at 6 per cent for four months.

Sale will begin at 11 o'clock. Luncheon will be served.

For nearly four years this herd has been headed by the richly bred bull "St. Louis King"—29094—a son of the noted Show bull and dairy sire "Pearlstone of Glenora" a many times winner in Canada's leading exhibitions and in 1909 was selected by A. S. Turner & Sons to head their world famous dairy herd at Ryckman's Corners, Ont.

The dam of St. Louis King "Vera of Kelso" is one of a family noted as producers and showring winners, her full sister Lily of Kelso was winner of the Canadian bred class at Sherbrooke, Que., 1909.

St. Louis King is of good size, ideal dairy type and conformation, and a look at the 30 or more of his offspring in this herd (or sale) will convince the most critical that he is breeding true to type and dairy conformation.

JAMES A. TELFER, *Auctioneer.*

Catalogue on application to R. CHESLEY COLPITTS, Manager, Forest Glen Stock Farm, Forest Glen, N. B.

All animals offered for sale have been tested and are free of tuberculosis

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

Episcopalian and Baptist Churches, High School, D A R. Station and stores within 1 mile. Absence of owner demands immediate sale. Terms easy, $6,500. GEORGE SANDERS, Round Hill, N. S.

Egg Trade Investigation.

During the past year the Live Stock Branch of the Department of Agriculture has been engaged in a preliminary investigation of the Canadian Egg Trade. Certain facts relating to the enormous loss that is charged back against the farmer and the unsatisfactory status of the trade as a whole have been collected and presented in Bulletin No. 16, entitled "The Care of Market Eggs." Realizing, however, the necessity of securing more detailed information before inaugurating any policy having for its object the bringing about of improvement in the condition of the business, the Minieter of Agriculture has authorized the appointment of J. H. Hare, B. P. A., of Whitby, to undertake the necessary investigation.

Mr. Hare has held the position of District Representative in Ontario County, Ont., for the past four years. He was born in Cobourg, Ont., and received his early training on the farm. He entered the Ontario Agricultural College in 1904 and graduated in 1908. Since taking up the District Representative work in Ontario County he has devoted much time and has been very successful in the organization of co-operative egg circles. Not only has he paid particular attention to conditions of the egg trade as they exist in the rural districts, but he has also made a close study of poultry business in general, and has written numerous articles, among which is a bulletin now in press. By virtue of his technical training and his practical experience, Mr. Hare is, therefore, well qualified as a specialist in poultry work.

Mr. Hare will first be concerned with the collection of all data that is available on the grading of eggs as they have been received at wholesale produce houses of Canada during the past two years. The information thus obtained will be used to form a basis for such action as may be taken by the Government in initiating a movement to improve and properly regulate the trade.

Mr. Hare will be located at Ottawa but will travel extensively throughout the Dominion, first in the east and later in the west.

Promoting the Cattle Industry in South Africa.

A South African correspondent of in Hoard's Dairyman, says that he yal Mail Steamship Co. which has secured the contract for carrying the mail between England and South Africa, has arranged to carry pure-bred live stock from England to the Commonwealth free of all charge except attendance and feeding. Formerly the charges imposed for such service were prohibitive to all except rich men. What is now being done will, it is said, give a great impetus to the cattle and dairy industry of South Africa. That Commonwealth may, indeed, in the course of a few years become an important factor in the world's supply of meats and dairy products.

Pure Bred Jerseys at Auction Sale

On Saturday, May 10th, 1913, at 2 o'clock p. m. at my residence, Norton, N. B., four cows, one two-year-old heifer in calf, one yearling heifer, three calves, and one two-year-old bull, all pure bred Jerseys. Also several grade cows, and some colts, carriages, farm implements and grain.

Dr. H. G. FOLKINS, Norton, N. B.

SHORTHORN CATTLE

To avoid inbreeding am obliged to offer my splendid, dark red, imported stock bull for sale. Bred by The Right Hon. Earl of Moray, Doune, Scotland, is of the low down kind and represents the best quality and families of this breed in Scotland. His color alone is worth his price to anyone wanting a head for a herd.

J. E. Hetherington, Codys, N. B.

JOHN RICHARDS,

Bideford, P. E. Island,

Shubenacadie, N. S.

"Use My New 'George' 100 Year Metal Shingle on the Roof and My Zinc Covered Corrugated Iron on the Walls of your Barn"

This is the Shingle I Recommend for Barns

"MY son, George H. Pedlar, Jr., invented this big shingle, just before he died. He planned a big shingle for big roofs, to lay in one-tenth the labor time needed for cedar. We made up and tested them for three years. I recommend the 24 x 24 inch 'George' shingle for good-size barns. It costs the same as my 16 x 20 'Oshawa' shingle per square. Both are in 100-year metal and are fireproof, lightning-proof and sunproof. These two shingles are the triumphant result of 50 years of labor in making good barn roofs."

"I HAVE been making metal shingle for farm barns for half a century. I found recently a hundred-year metal for my shingle. It surpasses and outclasses anything else in the world that a man can use for a barn roof. You want a 100-year roof on your barn, at about the cost of cedar shingle, don't you? Of course you do."

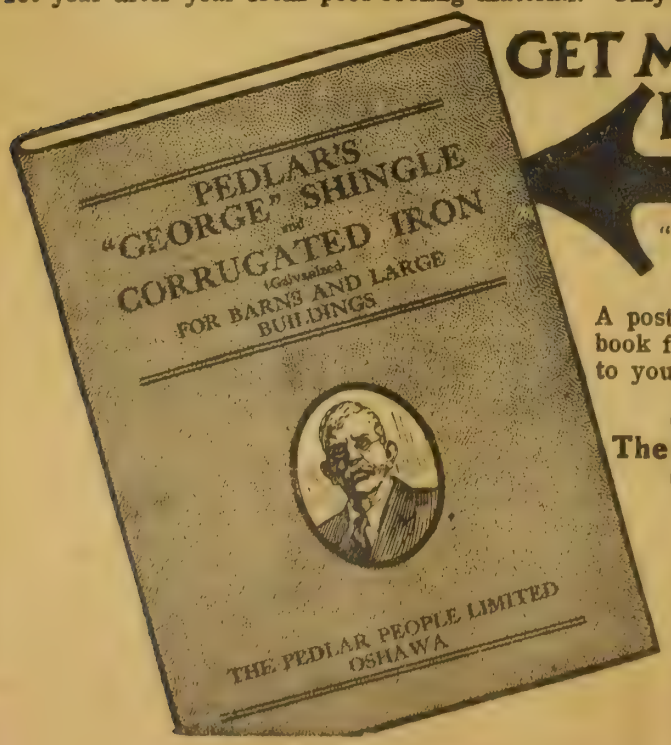
"Well, that means my shingle. My metal shingle will cost any farmer less to-day, and be lighter and stronger, than cedar shingle. This is because my shingle saves many dollars for labor cost in laying. My shingle needs no paint. Once this cost advantage did not exist. But now-a-days labor cost of laying is very high. Wood shingles are of poorer quality and advanced cost. All told, my roof on the barn itself is the utmost value your money can buy—is to-day's most economical roof."

"A barn built without my shingle is going to cost you more in actual dollars to-day, and next year, and every year, than you need to spend. It is going to be a leaky barn sooner or later. You will pay higher fire insurance. You will take bigger fire risk. You will either pay out money for roof repairs, or see your hay and grain rot year after year from poor roofing material. Only my shingle in metal will stop these troubles from the beginning. It will give service for one hundred years. Besides, you actually pay out less money for my roof, when laid, than for a cedar-shingle roof laid and painted properly."

"But that is not all in lowering barn cost. The time has come to stop using lumber sidewalls. Labor and lumber is too expensive. Use my galvanized, corrugated iron for the walls. It is fireproof and strong. It is applied swiftly in 8-ft. sheets, saving days and days of wages. Besides cutting out painting, every sheet of my iron in a brace, that strengthens your barn framing against sagging and wind pressure. A barn with my shingle and my sidewalls in metal costs less than the same barn with cedar shingles or roll roofing and lumber walls, when you figure in labor and paint. Use my corrugated iron for your barn walls, and my metal shingle for your roof—save money, get a lightning-proof barn, and get a longer-lasting barn than any other way."

"Write my nearest office about your new barn or remodelling your present barn. Tell us the dimensions. We will tell you what shingle and walls in metal will cost you and what they will save in labor and paint."

"Send them a letter to-day. I now have two sizes of metal shingle for you. My big shingle, the 'George,' is 24 x 24 inches. My 'Oshawa' is 16 x 20 inches. According to the size of your barn, we will tell you the right shingle to use. Even the big 'George' Shingle does not cost more per roofer's "square"; your roof and its shape determines the size needed. My corrugated iron goes with either shingle."



GET MY NEW PEDLAR BOOK FREE

"WHY not have my little book? It shows how a barn is built with my shingle and corrugated iron siding. It is a straight talk about making a better barn at less cost than the old way, and making it fireproof as well. A post-card will bring it. My nearest branch will send you this book free. I have just written it. It is my personal message to you."

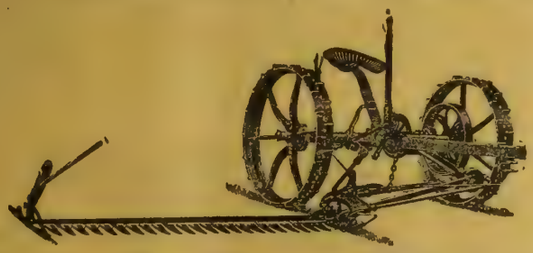
Have Frost & Wood help in your hayfield

THERE is an experience of 75 years behind "Frost & Wood" farm implements. This means that few farm machines have the benefit of so many suggested improvements by so many practical farmers.

When you buy a "Frost & Wood" machine or implement, the purchase you receive has in it details, materials and features of design that make it as nearly perfect in service and dependability as skill can make it. You cannot be in error, if your implement bears the name "Frost & Wood."



Frost & Wood Mowers

The long pitman on this Mower avoids broken knives and wear at the knife head. The drive from the main wheel is by means of an ***Inside*** gear operating an ***Inside*** pinion. This keeps two gear teeth in contact with two pinion teeth. and reduces wear. These close-meshed teeth start the knife immediately, and prevent choking at the cutter bar, broken knives and sections, and strain on the Mower and team.

"Frost & Wood" Mowers have roller bearings on the power shafting, are easily oiled, and give years of service like a new Mower on account of the care taken in building each part.

Frost & Wood Tiger Rake

We have put a "perfect" Rake on the market—the "Tiger." In the first place, it is strong and simple. We support the frame with a truss on the larger sizes, and make this rod of heavy steel. The teeth are perfectly seated in the tooth bar, and are of the best steel. They are tempered in oil and are so carefully shaped that they slip along the ground, missing nothing, but still not digging into the sod.

The foot-trip is an easy-working cog device, operating at the centre of the axle where the weight of the load is most nearly even. Everything is the best material obtainable, and the "Tiger" will give long service and fullest satisfaction. See the catalogue.

Write us for Catalogue or see the Frost & Wood Agent about any Farm Implement you need, especially if you seek years of perfect service in your machinery.

Save Work in Your Barn

Prevent Disease--Increase Profits

Let Us Show You How

BT Equipment saves half the work and time of cleaning the barn--and makes the barn twice as easy to clean.

It saves half the work and time of feeding, watering and caring for the cows. It saves feed, helps prevent tuberculosis, abortion, ruined udders and other cow diseases and ailments. It keeps the cows healthier, so they produce better milk and more of it. Those are facts! They have been proved hundreds and hundreds of times by dairymen in all parts of the country—dairymen who are now making those savings and extra profits by using BT Sanitary Barn Equipment. And we want to show *you* how *your* barn can be made modern—how you can save half the work and time—how you can greatly increase your profits.

BT Sanitary Barn Equipment

Steel Stalls, Stanchions, Bull Pens
Calf Pens, Box Stalls, Water Bowls

No matter how many cows you may have—BT Equipment will pay back its cost the first year—every year. We want to prove it to you. Let us tell you about the special features on the BT Stalls. Mail the coupon for our books and read them. Then you will understand why BT Equipment means more profit with less work. Stall book tells you about Steel Stalls, Stanchions, Calf Pens, Cow Pens, and Box Stalls. Also we'll send you our book "How to Build a Dairy Barn" which will give you many valuable ideas on the Sanitary building or remodeling of stables. Both sent free. Address

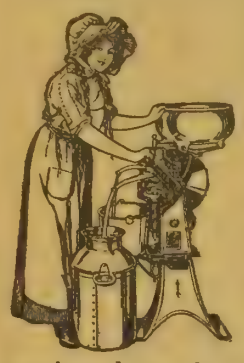
DE LAVAL
CREAM SEPARATORS

No Excuse for any Cow Owner Being Without One

There is no reason why any cow owner who sells cream or makes butter should be without a cream separator and there is no excuse why he should not have the best separator.

Any creameryman or experienced dairyman will tell you that a good cream separator will give you a good deal more and a great deal better butter than you can make with any gravity setting system and equally, of course, more and better cream, if you are selling cream.



The DE LAVAL is acknowledged by creamerymen and the best posted dairymen the world over to be the **"World's Standard"** and the one and only separator that always accomplishes the best results possible and always gives satisfaction.

You cannot make the excuse that you can't afford to buy a De Laval, because it will not only save its cost over any gravity setting in six months and any other separator in a year but is sold either for cash or on such liberal terms that it will actually pay for itself.

A little investigation will prove to you that the truth of the matter is that you really can't afford to make cream or butter **without** the use of a DE LAVAL cream separator.

The nearest De Laval local agent will be glad to demonstrate this to your own satisfaction.

Ideal Green Feed Silos
Are Sweeping the Silo Field

Last year we sold more than twice as many silos as ever before, and during the first three months of 1913 we have more than doubled the sales for the same period in 1912.

This shows conclusively that Canadian dairymen are coming to realize the advantages of the Silo and to appreciate just how much better the **Ideal Green Feed Silo** is than any other make.

Here are some of the points of superiority which make these Silos so popular.

Material: Canadian Spruce especially selected for our own use.

All lumber is saturated with a solution which prevents rot and decay and reduces the tendency of the staves to swell or shrink and adds two to three times to the life of the Silo.

Hooped with heavy round iron hoops every 30 inches apart.

Only Malleable iron lugs are used.

All doors on the Ideal Green Feed Silos are self-sealing.

Doors are only 6 inches apart, can be removed instantly and are always air tight.

The roof is self-supporting; built without rafters.

Silo can be filled clear to the top through the dormer window.

All sizes furnished.

Write for Our Big New Silo Book To-day.

How to be Successful in Raising Dairy Calves

Experience of a Practical Breeder and Exhibitor

By W. M. Lea, Victoria, P. E. I.

THE Maritime Provinces being a live stock country, and as all classes of meat-producing animals are steadily raising in value, the young stock, especially hand raised calves should be given much better care than is now the custom in many parts of our provinces.

Given all they can profitably consume two-thirds of the two-year-olds' weight will be attained the first year. This will be their cheapest gain, and it will influence their usefulness as mature animals and will largely decide as to whether profit or loss is realized in their raising.

Before the advent of the hand separator it was difficult to rear calves on skim milk. In cheese factory districts it must be a hard proposition yet. Up to the time we started a hand separator on the farm, we for years patronized a creamery the entire year, but as the milk was often returned sour or badly tainted, always had to be heated before feeding, and was more or less watered we found it anything but satisfacory, and never could grow the calves properly. In fact, it often made culls of them, even after we had fed for weeks on whole milk at the start.

However, there is no trouble to raise good calves every time with a hand separator. Never since we started using one have we had a stunted calf much less lost one. We have followed the same system for the past four years, and, while it may not be scientifically correct, it is simple enough to be easily followed, which is a strong point in any system.

Some Old Timers in the Orchard of A. R. Gorham, Gorham's Bluff, N. B.

We allow the cow to calve in her stall, as the stable is warmer than any other part of the barn. We turn the cow loose to dry out if cold weather then give her a little feed in her manger to attract her attenion and quietly remove the calf.

When it is about twelve hours old we milk enough from the dam to feed it and teach it to drink. This is a very simple process if the calf is hungry, and I have seldom found it necessary to give it the finger either. Have an assistant cant the pail. Then take the calf's head in one hand to force it down to the milk then with the other hand, instead of letting the calf suck your finger, grasp it below the eyes, so your thumb and finger can spring the mouth open and let it close on the milk just as it comes in contact with it when it will almost always grab at it again and go on drinking without any further trouble.

If the calf comes strong and in good flesh we feed whole milk for two or three weeks but if thin, whole milk fed a longer time, or until it will make good veal, that is our only rule. "Whole milk until it is in good flesh whatever time that may take."

We then start to gradually change to skim milk which the calf will be usually getting entirely when six weeks old. By this time it will be eating some hay, grain and pulped turnips. While we can give about all the whole milk they can consume we must be very careful after the fat has been removed, and it is always better to weigh the milk to each calf; one over-dose may start scours, and a little time lost weighing will save a lot of time dosing calves and is better for the calf.

We never put any kind of linseed mixture, gruel or anything at all in their drink. The theory of adding some kind of fat to take the place of the butter fat removed sounds all right and it may be the proper thing to do if we could be always sure of getting the proper amount at the right temperature; but it means extra work and it has been my experience that it is better not to bother with it. Linseed meal is costly and I would rather feed its worth of extra whole milk and teach the calf to eat all the whole meal it will as early in life as possible. To encourage this we always allow our calves to run loose together. The little fellows start to pick at the feed when they see the others at it and it is surprising how soon they will start eating under these conditions. We have fed as many as eight to ten together without bother by always feeding the same pairs in turn. They soon learn to count when their turn comes if you adhere strictly to this rule and enforce it with a good switch. I never noticed any evil results from them sucking each other.

Twice a day we give what pulped turnips they will clean up with a mixture of crushed grain and a little oil meal increased as the calves grow until they flesh up. We are careful to feed the milk always warm to calves under three months. Cold milk will cause trouble almost as quickly as anything.

Another matter of importance is to keep a look out for indications of scours and cut them on their supply of milk for a feed or two is all we are ever required to do. Raised by this method the calves will grow fast but may be rather thin up to three months when they will be eating enough dry feed to start to flesh up and you can make them as fat as you wish at six months by simply incresing the grain ration.

After the calf is four or five months old, we usually add some water to its skim milk and feed twice a day as the older cattle are fed. Up to about three months we must not expect very rapid growth as we must feed carefully and keep the calf's stomach right. After this age we can make a big yearling of it if we increase the feed as it grows. This is where most people fail. They wean the calf before it is old enough to make good use of other feed. There is no animal on the farm that will better pay for skim milk feed until one year old, than a calf, and there is no feed like skim milk for keeping a young animal thrifty and growing fast. We feed it usually up to a year old. We have had calves so raised that weighed 1060 pounds at this age and always have them large as yearlings.

It has often been stated that there is no feed left in milk after the cream is all taken out by being put through a separator, and some are of the opinion that it is impossible to rear a calf without feeding a large quantity of whole milk. I had occasion to test this matter two years ago.

A grade bull calf was dropped shortly after returning from the shows, and as everybody was busy getting the corn in the silo we decided to put off slaughtering it until a more convenient season or until the cow's milk was fit to use. After a few days when we began to separate her milk we put the calf at once on skim milk entirely to keep it from starving until we could attend to it, but the weather being fine and everything in a rush he was left so long we just went on at that and that calf never got any whole milk in his life excepting the colostrum. He just lost the usual treatment for the first six weeks. We kept him and he took chances amongst the others and was fed afterwards just as they were and when killed at fifteen months dressed 450 pounds baby beef. This calf was pretty badly scoured at first but never had any medicine, only was cut in his milk occasionally but he had some indigestion. He was thin up to six months and dropped some back of the shoulders from which he never recovered but he grew all the same. The skim milk along with his other feed up to a year was what made him grow.

We find it a good plan to have a small pasture well fenced, convenient to the buildings, to turn the calves in at night. They are fed before going out at night and after they come in, in the morning, and we always have a good strip of Mammoth turnips left in the field our green feed was used from, to turn the calves in in the latter part of September. Turnips are a great feed. All the calves can eat is good for them and after they get accustomed to them you can drop both milk and grain and they will

gain in flesh. We allow them to run over an acre or more of them and eat all they want and stay out until the snow flies good and plenty. They will be found husky, thrifty and in great shape to winter. While it costs some money to grow calves this way we find it cheapest and best to do so. Two pounds grain a day is about what a bunch of three to six months calves average and we don't feed over 1,000 lbs. per calf the first year, which is not much to an 800 to 1000 lbs. calf. Our calves are, of course, pure bred Holstein calves that are dropped usually from September to February. I think many June and July calves will do equally as well if fed and cared for the same, but they can never with us, get as good attention as the winter calves and we seldom have them come at that season.

Calf feeding, like everything in the stock line, should only be done by "an observing person," one who will always notice anything going wrong while there is a chance to better it, and who has good judgment in increasing feed. A great many calves are starved while young for want of hay and grass. I have seen them confined in all sorts of enclosures where the grass was all eaten off or dirtied by other stock and poultry. An old orchard seems to be a popular place to confine them and any kind of feed seems to answer the purpose.

A lot of silly superstition yet exists about their calf raising. I have often been amused to hear pretty level headed men talk about their calves not doing well this year somehow, they just didn't do well. As if this was a business outside of their control, such as the weather, and if the case of a young bull, they always put it down as that they must have fed him too well. In the larger breed of cattle it is difficult to feed too well if the foods are properly balanced. Animals, are sometimes for a more or less short time off feed, on feed that may be too violent a change but are rarely ever fed more than they require to make proper growth. Few unexperienced men seem to realize what an animal that will reach 1000 pounds at one year old consumes. That is a big average gain per day and they can't eat roughage enough to acquire it. One thing is certain, if we are to have better cows to surplant all those condemned by the Cow Testing Associations, we have to have a radical change all over the country in the method of feeding calves during the first two years of their lives. No man can excuse himself with the plea that he cannot afford it. He must not attempt to rear more than he can find feed for continuously. Nothing is more foolish than spasmotic feeding for short periods and changing abruptly. We must get on to some system that is grinding surely all the time.

Prepare well in advance for every emergency and have feed for all you attempt to keep. Nothing is so suitable for the live stock interests of any county as a cream gathering creamery operated the year round. Where ever you see them you will invariably find the best stock, and where cheese factories are only operated for the summer months I would like to see a butter plant operated a few months at least, spring and fall. It would give the calves a little chance and the patrons an experience in a good business that they might soon continue throughout the year. If I were forced through circumstances to be a patron of a cheese factory I would have the cows freshen in February and March to make butter for a time so the calves would have a little milk. Few men can resist the temptation to send about all the milk away when it is worth good, ready money and the result is we seldom find decent calves in a cheese section. P. E. Island is covered with these factories and the cattle are not improving very much in quality for this reason; nor the business increasing as it should. Good feeding is certain to pay. A well fed calf can be at work in the dairy a year earlier. You are not so liable to accident, sickness or loss. You will have a much more valuable animal to dispose of at any time and something to add pleasure to your work. Breed, feed and weed, or feed, breed and weed, which every way you put it, should be the aim. purebred or blue-blooded animal can make bettee use of the feed it gets after it is fed all it can consume. No animal stands starvation more profitably than a scrub. There is no secret or economical way of raising young stock that the animal cannot discover. The only way is to breed for a special purpose and only attempt to raise what you can feed a full and proper ration.

Four promising Ayrshire Calves from the Forest Glen Herd.

A Fine Quintet of Ayrshires. The Pride of the Forest Glen Dairy.

Milk Viens and the Udder

In a recent issue of Hoard's Dairyman a subscriber asks the following questions of interest to all dairymen in regard to the elaboration or secretion of milk:

(1.) Why are the abdominal veins crooked?

2.) Do the abdominal veins branch? If so, what course do the branches take and where do the branches enter the vena cava, posterior or anterior.

(3) What is a milk well on the mammary vein?

(4) Does the abdominal vein get smaller after it leaves the udder on its course toward the heart?

(5) Did you ever see crooked abdominal veins on a heifer before the udder commenced to enlarge or fill just before freshening?

(6) Does the quantity of milk produced depend on the size or weight of the mammary gland?

(7) What is the amount of blood pressure on the mammary gland, while at rest and while milking?

(8) Do the cells of the alveoli secrete the constituents of milk while milking or at other times?

(9.) Can you, by feeding or manipulating, create more or new lobules, alveoli or cells that secrete milk, or do you simply strengthen those present?

(10. Can water or any other substance of milk filtrate into the udder or gland when the ducts and lobules are filled with milk? Or in other words, how can the mammary gland secrete the different constituents of milk from the blood when the milk pressure is high and blood pressure in the capillaries is nil?

ANSWERS GIVEN.

Answering the above questions, Alfred King of the State of Maine gives advice as follows:

1. The abdominal veins are naturally crooked to allow stretching of the part, which, if sudden would rupture the veins. A second reason is the veins grow in length with a gradual increasing size of the abdomen. When the increased size is lessened as by parturition, the veins are left more crooked. A third reason is that the pressure of the blood not only dilates the veins but lengthens them. This also makes them crooked as the point of origin and termination remain the same. These three causes may all work together in making crooked veins.

2. The abdominal veins are formed from branches and receive branches as they proceed in their course but do not divide into branches. They pass through openings in the muscular portion of the anterior abdominal wall, on the inner side of which they join the internal thoracle veins, one on each side, with which they become continuous. The internal thoracic veins each accompany an artery of the same name. They run forward under the inner lining of the lower wall of the chest and enter the anterior vena cava of the first rib.

3. Milk wells are at the openings in the muscular portion of the abdominal wall mentioned in answer two. These dilated openings contain connective tissue, small arterial branches and dilated milk veins distended with blood. The dilated vein distended with blood at this place is called a milk well.

4. The internal thoracic vein, which is a continuation of the milk vein, is much smaller than the dilated milk veins.

5. Crooked abdominal or milk veins are seen on heifers before they have had a calf. They are more easily felt than seen. They do not become very conspicuous until after calving. The dilated milk veins do not appear until after a heifer has had a calf.

6. The size and weight of a mammary gland depend upon the tissues forming it. These are principally skin fat, fibrous connective tissue, blood and lymph vessels, milk ducts and alveoli, blood lymph and milk. The number of alveoli in the glandular part and the activity of the cells lining them would have to do with the production of milk. Growth of fat and connective tissue, or swellings from various fluids or tumors would not increase the quantity of milk but decrease it.

7. I do not know that the blood pressure in the mammary gland has been measured, nor do I see how it can be measured satisfactorily. Active secretion is accompanied by a dilation of the small arteries and capillaries of the aveoli. This leads to an increase of pressure variable with the activity of the secretory processes. This would be slightly increased by the milking process.

8. The cells of the aveoli secrete the constituents of milk, while milking and at other times during the lactation period. The formation of milk is continuous but is subjected to variations in amount from numerous causes. Milking excites, accelerates and prolongs glandular secretion, but the milk formed is soon removed. When the quantity formed is very large, three or four milkings a day may be necessary, but in ordinary conditions more than two milkings a day has not been found profitable. For a most active milk cell to take up food, form within itself oil globules, sugar of milk, and casein, burst and repair the injured wall preparatory to another cycle of activity, some time is necessary, probably more than that required for milking. As cells are found in different periods of the cycle it would be impossible to start them working at one time if the production occurred only while milking. The fact that the milk ducts fill again with milk after being milked but showed the continued secretion of milk.

9. The development of the glandular portion of the udder is partly due to feeding. Lack of feed or improper feed will stunt the growth of any part. Proper feeding will assist in promoting the development of any part. The growth of the mammary gland starts in early foetal life. Another period of growth takes place at puberty. Another occurs during pregnancy and another during the earlier part of the lactation periods for several lactations. Milk cells in their activity produce not only milk, but other milk cells and form other alveoli. As feeding is one of the means of promoting this activity, feeding at times of glandular growth promotes the formation of new lobules or alveoli. Manipulating, which improves the circulation of the udder or excites the milk cells to increased activity at these periods, will cause development of much alveoli. Proper feeding and manipulating also improves the cells.

10. Water or other substances of healthy activity of the milk forming milk may be absorbed from the milk ducts or lobules filled with milk when there is retention. When milk ducts are distended with milk, which cannot escape, the resulting disturbance or irritation checks and finally stops the secretion of milk.

pounds of these elements, it is only fair to figure them at these values; by good rights the figures should be higher, considering the additional humus value to the soil.

Many years ago Dr. E. H. Jenkins, director of the Connecticut experiment station at New Haven, announced that roughly speaking, 80 p. c. of the fertilizing value of feeds given milch cows is returned in the manure. He figured that 90 p. c. was returned from fattening cattle, and hogs; 85 p. c. from working stock and sheep, and about 75 p.c. from young growing stock. In other words the animal's system appropriates only portions of the food that it can best use and a large per cent of the fertilizing value passes on to aid in building up the soil, that most profitable crops may follow.

For convenience the accompanying atble shows the number of pounds of nitrogen, phosphorus and potash that are found in 1000 pounds feed meal, hay silage, etc.
of common feed like bran, cotton-

FERTILIZING ELEMENTS IN DIFFERENT FEEDS.

(In terms of lbs. for every 1000 lbs. feed.)

	Nitrogen	Phosphorus	Potash
Bran	26	28	16
Cottonseed Meal	68	28	8
Ground Oats	17	9	5
Gluten Meal	50	3	0.5
Corn Meal	18	7	4
Corn Stover	10	3	14
Mixed Hay	14	2	2
Clover Hay	20	4	22
Corn Silage	3	1	4

With this data any farmer is able to calculate for himself the approximate ferilizing value that animals are returning. It will vary somewhat with the feed given animals, more concentrated feeds like cottonseed meal bring up the value of the manure pile.

However, for example suppose we take the standard ration at the Connecticut agricultural college for its herd of 20 cows the past five years. This is announced as 35 pounds silage, 12 pounds mixed hay, 2 pounds bran, 2 pounds corn meal, 2 pounds gluten and 2 pounds cottonseed meal. This is per cow per day. At least an eight months' feeding period should be calculated since the cows will be at pasture only about four months in the year and it may be less these days. This would be 240 days. Now multiply the 35 pounds silage daily by the 240 and the result is 8400 pounds silage that one cow eats in the eight months. Doing the same for the other feeds gives the following results; 2880 pounds mixed hay and 480 pounds each of bran, corn, meal, gluten and cottonseed meal eaten during the eight months or 240 days.

Now we are ready for another table showing the pounds of fertilizing elements in this silage hay and grain. Reference to our first table shows that in every 100 pounds corn silage there are 3 pounds nitrogen. Then in 8400 pounds there will be approximately 25 pounds nitrogen; further, there is 1 pound phosphorus in each 1000 pounds silage, then in the 8400 pounds there would be 8 pounds phosphorus; of potash every 1000 pounds carries 4 pounds hence in 8400 pounds there is approximately 33 pounds potash. Figuring out each element in this way for each feed gives the number of poa nds of nitrogen, phosphorus and potash in the feed that each cow eats in 240 days. See table.

FERTILIZER IN 240 DAYS' FEED.
(In pounds.)

	Nitrogen	Phosphorus	Potash
Silage	25	8	33
Hay	24	4	42
Bran	12	13	8
Corn Meal	8	3	2
Gluten	24	1	0
Cottonseed Meal	33	14	4
Total	127	43	89

Adding the number of pounds nitrogen that each feed carries which each cow has consumed in this period we find 127 pounds nitrogen, 43 pounds of phosphorus, and 89 pounds potash. If milch cows return 80 p. c. of this feed in the manure pile, then we can figure on there being 101 pounds nitrogen, 34 lbs. phosphorus, and 71 pounds potash. This is the amount of fertilizer actually in the manure heap per animal, il the farmer has done his part in saving both liquid and solid excrement.

If our nitrogen is worth 18 cents a pound, we have the equivalent of $18.18 worth of nitrogen; 34 pounds phosphorous at 4½ cents is worth $1.53; 71 pounds potash at 5 cents is worth $3.55. This gives a total of $22.26 as the cash value of the plant food that each cow returns on a standard ration such as used by the Connecticut college for eight months in the year.

It will be observed this is above the $20 average, but the reader will also note that the Connecticut institution gives a better grain ration than some feeders provide. Some cows may not take this amount of food for the 240 days and again it is rarely that all manure receives the care it should. Hence, the $20 estimate per animal is not far from accurate for a large number of cases. The question is if farmers actually so handle the manure that this value is realized. If it is not, then why not? —N. E. Homestead.

A Bunch of Pure Bred Ayrshires owned on the Forest Glen Farm.

Farm Manures High in Value

The farm manures resulting from the keeping of live stock on the farm doesn't receive the attention it should. It is unfair to a dairy herd and to the annual balance sheet to ignore the high value of stable dressing which has been well cared for. Quite outside of the fertilizing value in terms of nitrogen, phosphorus and potash that the dressing carries, the humus value and consequent improved mechanical condition of soil, are important. Roughly speaking dairymen who figure this source of income estimate that a single milch cow fed normally, will return approximately $20 per annum in farm or stable dressing. With only a herd of ten cows this $200 is not to be sneezed at.

If the farmer wishes proof that this estimate is not high and cares to figure it out in dollars and cents the accompanying tables and explanations will be convincing. It is not difficult to determine the approximate value of the stable dressing per animal, once settled on two or three general principles.

To begin with, the value of nitrogen in the open market may be taken as 18 cents a pound, phosphorus (wrongly called phosphoric acid), 4½ cents a pound, potash 5 cents a pound. That is what your fertilizing elements will cost if you buy the most economical forms of chemicals and they may cost more in the case of some mixed goods. If the stable dressing carries a certain number of

Commercial Fertilizer.

The question of soil fertility is of great importance to the farmer. Good farming consists in growing profitable crops and at the same time maintaining or even increasing the productive power of the soil. Many farmers are able to do this from the experience of years, during which time, the character of the soil, its adaptation to certain crops, the method of its management and manuring have been made the subject of careful study, without, however, any definite knowledge concerning manures and their functions in relation to soil and crops. Experience is a good teacher, nevertheless a definite knowledge of fundamental principles may be substituted for years of experience in the successful use of manures.

The fertility of the soil would practically remain unchanged, if all the ingredients removed in farm crops were restored again to the land. This to a large extent, may be accomplished by making the farm a factory where crops grown on the farm are fed to animals, carefully saving the manure, both liquid and soild, and returning it to the soil. A careful study of the subject indicates however, that as a rule, the manure produced on the farm is not sufficient to maintain its fertility. Hay, straw and grain are sold and nothing brought back to rep,ace it. Very often the manure is left in a heap under the eaves of the barn to be leached away to the brooks and ponds and the liquid portion runs down under the stable to be lost forever. Then the improvident farmer spends money on commercial fertilizer to replace this loss.

The system of growing crops of grain year after year on the same fields, then seeding to grass, and mowing these fields until nothing but wire grass and white flowers grow, has tended to rob the soil of its humus, which is one of the main factors in producing profitable crops.

It is a great mistake for any man to think that by the use of commercial fertilizers in large or small quantities combined in the most scientific way, that he can for many years maintain the productive power of his farm unless he takes special care to keep up his humus supply either by well kept barn manure or the plowing under of green crops.

Very large quantities of commercial fertilizers are used on the orchards of the Annapolis Valley. This seems to be the only way for the reason that in many cases all the available upland is planted to orchard, no meadow or dyked land is attached to the farms and hence the supply of barn manure is limited, and to successfully grow fruit the nitrogen and phosphoric acid is supplied by commercial fertilizers and the humus by plowing under in the autumn, heavy crops of summer vetch or crimson clover.

These three elements, Nitrogen, Potash and Phosphoric Acid are the elements most likely to be deficient in our soils for the reason that they are the three principle elements of plant food. The value therefore, of a commercial fertilizer is determined almost exclusively by the amount and form of the above named elements. Soils differ in their needs. A sandy soil is generally deficient in all the mineral plant foods as well as in humus. Clayey soils are usually well supplied with potash.

There are numerous companies, both in Canada and the United States for the manufacture of commercial fertilizers. The different brands are made up of a mixture of the various kinds and forms of fertilizing material on the market, sometimes termed chemicals. And the difference that exist in the brands of different manufacturers is due to the variation in the propor-

WHY FARMERS MUST COMBINE

It is silly longer to contend that prices arrange themselves automatically in accordance with the variations of supply and demand. There are too many evidences that individuals and corporations dealing in the commodities determine the prices that shall be paid for them. In the case of manufactured articles, merchandise and mine products, the owners or sellers name the price, but in the case of farm products, the buyers name the price.

Only a few days ago the buyers of poultry, eggs and dairy products in St. Louis met to form an exchange, not in the nature of a trust, as did those who partiripated in the meeting, but merely an association "for the purpose of fixing prices." These people, it was claimed, had been put to considerable inconvenience, and in some cases, to losses, by not knowing what the others had on hand, or what they were paying or charging; for this price making system, of course, involves the making of the price that shall be paid the producers as well as the price that shall be charged the consumers. Thus these dealers, acting in an organized capacity, determine the margin or profit between the buying and selling prices, and so fix their own income.

Heretofore these prices had been fixed by the city's general board of trade which gave the actual dealers in these things only a general voice in the price-making, whereas they desired the entire say in the matter, and they now propose to have it by an organization of their own.

In mercantile transactions, and in general business, including manufacturers, it is a well-settled principle that the selles names the price, and the buyer may not pay it or leave the article alone. It is true, two may "haggle" and come to an agreement as to price, but that does not affect the general principle that the seller is the price maker. It necessarily must be so. The ownership of property depends upon it. Whaever owns an article can retain that ownership until a prire satisfactory to himself (his price) is paid for it. There is but one exception in organized society or government, and that is the well-known Right of Eminent Domain, which means that the public is greater than the individual and the individual right must yield to the public good. If an individual own property and that applies only to landed property or other propezty that may be declared a nuisance) that it is important for the public to possess, and he refuses to sell to the public at a reasonable price, such individual owner may be compelled to sell to the public at a reasonable price, such individual owner may be compelled to sell regardless of his own wishes in the matter. But in that case the purchaser does not fix the price. A jury of the individual neighbors is called to do that, and to the actual value of the property may be added any damages the individual may sustain on account of having to surrender the property as by reason of the use to which it is put.

The above is the theory of exchange, of buying or selling, and it is observed in all cases except when farmers sell the products of their soil and toil. Neither the law of eminent domain nor the right to abate a nuisance applies then. It is simply accept the buyer's price or accept the stuff and the farmer must sell or go without an income, or do without money to meet the wants he cannot supply himself. The price offered may be so low that he gives double value for the money he gets, but he must have what will buy other commodities; and there again he must meet the price fixed by another.

So far as selling and buying is concerned, the farmer is absolutely without protection or a chance. But he need not be. The farmer is compelled to sell to get money, but he is nat compelled to sell to getmoney, but he is not comwould only practice what others teach them, and organize as others do, they would refuse to sell except at their own prices, as others do, and gain for themselves r?asonable profits, as others do.

BREEDING LIVE STOCK

The breeding of live stock does not get the serious thought from the farmers which it demands. Raising stock is one thing and breeding stock is another. The addition of a calf, colt or a lamb to the herd is regarded on many farms as ol very ordinary importance, but on farms where high class stcok is reared, the addition of a young animal to the herd creates almost as much interest as the birth of an additional member to a family. In the case of the ordinary calf or colt, there is little or no interest manifested as to the future of the animal. If the calf or colt is pure bred, its daily growth to maturity is watched with anxiety. If it is a heifer calf that is dropped the interest is so great at the time that it is difficult to wait until the calf becomes a cow in order that it may be known how much of an improvement she is over her mother in milk production. If a colt, the farmer can hardly wait until it is old enough to drive in order that he may determine what speed it will make on the track. When good stock is introduced on the farm there immediately becomes attached an interest which is not shown in scrub stock. It is this interest and sentiment which have resulted in producing some of the world's record breakers, and the interest doesn't fail to appeal to any man who endeavors to improve the live stock on his farm. This is one of the advantages of breeding good animals. This is one of the things which make farming and live stock husbandry entertaining, instructive and profitable and removes the old time drudgery.

LEARN MORE ABOUT FARMING

Did it ever occur to you that the farmer when he is successful and when he does his duty toward his fellow men is a very important man to society and the state? Society looks to the farmer for food and clothing. Nature spreads before him the most beautiful flowers and choice fruits; the forest is clothed with rich verdur, the streams ripple and surge against the moss-covered cliffs for those who linger at their brink. What a pleasant occupation, what opportunities for contentment and happiness! Surely, we are fortunate to have such privileges for useful lives. Do we fully appreciate our opportunities on the farm? Do you take advantage of the situatian to be prosperous, useful and contented boys and young men? Do you know how to enjoy the blessing which nature has so bountifully placed before you?

Those who do not enjoy farm life are not worthy of the good life that is possible on the farm. Those who see nothing good and happy in the companionship of nature would get more out of life by taking up some other work. We should search our aptitudes diligently and find out what we can best follow and prepare ourselves for it. Without preparation success is not probable. Those of us who like the farm and fully enjoy its environment should strive every day to get more information on farming. We should not be contented to be an ordinary corn grower, or an average farmer. Those who have become specialists in corn growing, stock raising, fruit growing and cotton growing, have learned how to study and application to the principles of good farming. They did not become specialists by accident.

Let us as intelligent boys and young men resolve from this moment that we will better appreciate our great opportunities on the farm. Let us determine to become better farmers and good men. Let us study our soil, our crops and books and papers that give us information about good farming in order that we may learn more about this occupation than we deem so important. It will be easy if we are determined in this matter. Thousands of otners have done this. Why can't you?

WHICH ONE?

There are two types of farmers quite common on our Canadian farms. The farmer who works hard from daylight till dark and never seems to get much out of his labor except a liv ng or the advance in his land for which he is not entirely responsible, and the farmer who seldom has to work overtime, finds time to visit his neighbors and enjoys life to its full measure, while his crops stock and bank account thrive.

There is a reason for this difference and we need not go far to seek the cause. The first named farmer starts in anywhere and usually ends nowhere. He is without a system. He works with his hands but fails to use his head. Planning things has not become a habit with him. He does not look far enough ahead, depends upon brawn instead of brain and brawn to carry on his farm operations. He may have plenty of pluck, perseverance, integrity, but lacks the one acquirement, system, so essential in farm work.

The successful farmer is forehanded. He plans things and keeps more than one kite on his string. Rotation of crops, stock breeding, farm accounts are studied by him. When the iron is hot he strikes it. Good seed is planted at the right time in the right place. "The hit or miss" method is not in his category. He doesn't go after a proposition until he is sure it is for his best interests. He studies his business akin to the attention paid by the successful merchant in handling a successfu, enterprise. Details are not forgotten. Economy of time is brought about by rushing the step in the busy season instead of extending the hours. True, he may not always be successful in every operation, but where results and work are weighed at the end of the harvest the profit side of the ledger shows the usual profit.

WASTE IN SEED SOWING

It is said of a famous mustard maker that he has not made a fortune out of the mustard consumed so much as by that left uneaten on the sides of plates. Just so, and if there was no waste of a somewhat similar character, the seed trade would most likely be less profitable than it is. It is one of the failures of agricultural and horticultural humanity to sow too many seeds, and there seems to be no getting away from the habit. Perhaps it is a mere habit, or it may be want of confidence, or a desire to ensure against loss, but the fact remains that the only time when seeds are sown about as they should be is when there is a fear that the supply in hand will be insufficient to go over the ground that is being sown. In the old days of adulteration, and when the means for preparing and cleansing seeds were not so complete as they are now, it might have been essential to sow very thickly by way of making allowances for failure, but at the present time there is little need to consider these points if the seed is obtained from a reliable firm and a fair price is paid for it. To sum the matter up briefly, it is unwise to be niggardly in the distribution of seed, but to be wasteful in sowing twice as much as is needed is an equally bad policy.

"The time has gone by when goods, no matter how excellent, will sell themselves. The quality may be the highest, or the price the lowest, but that alone will not sell them. They must be made known to the consumers in such a way that the consumers will demand them and will not be satisfied with substitutes."

The telephone is handy in asking how a sick neighbor is, but it doesn't take the place of personal help in the sick-room. Mix a few personal visits with your well meant inquiries.

Conserving Soil Moisture.

Editor Maritime Farmer'—

I would like to have you tell me if I am pursuing the best course to conserve moisture in a dry field. Description of soil treatment given and to be given, are as below:—

The soil is sandy, gradually growing harder and poorer as we go down until at three and a-half feet it must be picked and at five feet it may be called shell rock. Further down the layers thicken enough for building purposes. It has been so frequently manured with barn manure and swamp muck that the surface for six inches has grown much darker than when I began to cultivate it. Last year it grew potatoes and was plowed after the crop was lifted. It was plowed only because the potatoes were so poorly dug that it payed to plow and hire a picker to follow the plow.

Believing that wheat likes a firm soil I did nothing this spring but harrow with a spike tooth harrow, teeth being 2¾ inches long. Twelve pounds of clover seed was broadcasted when the wheat was drilled in and covered with same harrow. I purpose harrowing again in four days, and in four days later rolling in another four days harrow again and in another four days give a final roll. In the event of rain the harrowing and rolling will be done as soon after as possible. Will the clover stand all this disrurbance?

I use this same harrow on potatoes about twice a week from planting until they are well up and almost all weeds coming from seeds are destroyed.

I am in doubt whether rolling will hasten evaporation or retard it, but expect in this kind of soil it will break up capillary attraction.

Please clear up my doubts.

Arthur M. F.

If it were our case we would roll immediately after seeding to pack the soil around the seed. We would not care to disturb clover seed twelve days after seeding. The harrowing will kill the weeds and form a mulch. We have seen a field of wheat through which a runaway team attached to a harrow passed after the blade was up several inches and while it seemed to do a lot of damage at the time the harrow's path soon recuperated and made much more rapid growth than the rest of the field, so much so that it could be readily distinguished from a great distance.

We think it would be advisable to sow the clover seed at the second or third harrowing instead of with the grain.

If the soil is very fine the rolling will break up the capillary attraction but if coarse and open the rolling will increase the capillary attracting by bringing the particles closer together and thus making it easier for the moisture to climb to the surface. It would be well for you to leave a few check plots and compare the results of the cultivated areas with the uncultivated plots.

What is a Fertile Soil?

Editor The Maritime Farmer:—

The question may be answered broadly. A soil that will grow good crops, but this does not give all the answer. From whence does the plant get its food? We know that plants get food from the air, a much larger per cent than from the earth.

From the soil it gets phosphorus, potash, sodium, sillicun, calcium, iron, lime and other substances, from the air, oxygen, hydrogen, carbon and nitrogen. Some of these elements the plant requires in a very limited degree but every one it must have in order to grow, neither can one be substituted for another. If the soil contains all necessary elements to grow a full crop excepting one, the limit of that crop will be the amount the plant can get of the deficient element. Hence, we find that land deficient in, say, lime fails to give satisfactory returns, although all other elements may be present in abundance.

Neither will soils containing all elements necessarily always produce satisfactory returns, because the plant food they contain may not be available or in a form that the plant can use it. Gravel may, often does, contain all the mineral elements the plant needs but yet it will not grow crops.

Crops often fail, not so much from a lack of plant food in the soil, as from inability to get that food, on account of a poor texture—lumpiness, looseness and a lack of moisture capacity or because of a lack of drainage of stagnant water from the soil.

Plant food must be available, or in such a condition that it can be easily dissolved by water. Roots of plants never take in solids, and soil water can only dissolve food from the soil it comes in contact with, hence, the finer the soil particles, the more readily can the water perform this function. To put it another way, cultivating the soil, i. e., fineing it is fertilizing it. Usually only three elemants need be cared for in the soil, nitrogen, phosphoric acid and potash and sometimes lime.

¶ Mr. J. H. Wright will travel through the counties of Digby, Annapolis and Kings during the Summer of 1913 in the interests of the *Maritime Farmer*. He is authorized to take ad. orders, new subscriptions and collect for renewals.

When we use the term plant food we mean the first three and they are the ones quoted in commercial fertilizers.

Phosphorus we get from the bones of animals and from phosphate rock that must be treated before being quickly available. The potash in the soil is mostly in compounds, known as sillicates, such as much of our sands. These are very slowly soluble in water. Perhaps it is well that this is so, else it might have been leached out as nitrogen has been from much of our soils.

Potash is made available by tillage and the decay of humus in the soil. Tillage fines the soil, reducing the size of the soil particles, humus gives a good, fine texture and adds to the ability of the soil to hold water. Other substances, such as lime, salt and plaster tend to render potash available. In wood ashes we have a large amount of available potash, hence the well-known value of ashes to the soil, particularly in assisting to get a catch of clover. The potash of commerce comes largely from Germany, in the form of Nitrate of Potash.

Nitrogen is the most expensive, and the easiest lost or destroyed of all plant foods.

Nitrogen is the element that gives the dark green color and abundant growth; while stiffness of stem and fruitfulness are an indication of abundance of phosphoric acid and potash. A yellow color and stunted growth indicate a lack of nitrogen or a deficiency of moisture or what is likely both, as largely moisture will not remain during a dry time in soils that are deficient in humus, which is the base of nitrogen. Nitrogen is formed in the soil by the decay of animal and vegetable matter therein, hence the old maxim, "To build up a fertile soil we must have something rotting in the soil, making humus, and something growing on the soil, taking up nitrogen released at the same time.

By the burning of straw stubble and such like we lose a large amount of nitrogen as we also do by the over-rotting of stable manure.

There is also a great family of plants that have the ability to take in free nitrogen from the air by means of the agency of a certain bacteria residing in nodules on the roots. Prominent among these are the clovers, pease and beans, by a judicious use of which in a rotation sufficient nitrogen can be secured to maintain the fertility of the land for all time.

Early Vegetables Show Profit.

I find carrots, beets and parsnips three as profitable vegetables to raise as any I know of. If planted early they can be bunched and got in the market early, and early bunch stuff always sells well, and what is not disposed of in this way can be harvested for busheling for the winter market.

In preparing the soil for these vegetables I plow the ground in the fall and again in the spring, using a liberal amount of stable manure, from six to eight cords per acre. By plowing in the fall it gets the ground in better shape for bed stuff and all hoed crops. Many people neglect fall plowing, but I claim it is a most essential step toward successful farming.

This method also works well on witch gtass, as by turning it in the fall the roots are exposed and the frost works sad havoc among them. I will tell how I received $140 from ⅛ acre potatoes. I exhibited 80 varieties at the Rockinghm fair and won $70, including $10 in gold for the best exhibit of New Hampshire grown potatoes. I then sent these same potatoes to the Greenfield fair, where they won another prize of $17. I then exhibited 104 varieties in the New Hampshire state fair held at Nashua, where I won another $52.50, making a total of $140.

I have had the best luck raising potatoes where I have planted to cabbage the year before on greensward, turning under the cabbage waste and using 100 or more pounds fertilizer per acre. The old sod which has not become fully rotted is just what the potato roots like and the tubers will usually come out smooth and clean.

Both summer squash and cucumbers gotten in the market early are very profitable, as they always bring good prices. They should be planted, cared for and manured well. There is nothing better for the common running squash and melons than manure broadcasted and hen manure or fertilizer in the hill.

In storing vegetables for the winter I have two cellars, one for cabbge and one for roots and potatoes. Cabbages require a cooler place than the roots. I usually keep my cellar for storing cabbages as near the freezing point as possible.—Fred G. Steele, Hillsboro County, N. H. in N. E. H.

Kinks in Growing Carrots.

You invite farmers to send in their way of raising crops, and as I have had good success raising carrots, I will say a word. I have raised these more or less for over 40 years, and for the last few years more than formerly, as I find ready sale in the village. Have always used them at home for my own stock.

I use old ground. Plow in from 20 to 25 loads manure per acre. Then harrow many times till very fine. Sow 800 pounds per acre phosphate and harrow in well. Be sure of good seed. I use Danvers half long and plant with hand seeder. Run the rows straight. As soon as carrots are up go over with wheel weeder and keep it up every week or 10 days till the tops cover the ground.

In 1911 on 35 rods of ground I harvested 312 bushels of 50 pounds per bushel. In 1912 on same land I had 280 bushels. This was a poor season for many crops. I give close culture, rows 20 inches apart.

Thin to 1 or 1½ inches apart in row. This is the main work of the season. Now as to harvest: Late in October I mow the tops off close with a scythe; rake off, then with hoe clip close and rake off again. Then take a one-horse plow and plow two furrows to the row. The last time run very close to carrots. I then take a garden rake and push them into the furrow. They are then ready to pick up and bag. This is the fastest way to harvest I know of. I have several times, with a man to help me, harvested and put in cellar or storehouse over 100 bushels in eight hours. For three years I have sold them for 35 cents per bushel. It brings in good money for land used and no enemies to fight our weeds.—O. B. Shattuck, Orleans County, Vt. in N. E. H.

Potatoes, Oats and Hay Rotation.

That potatoes with a moderate amount of fertilizer make a good forerunner for a field of oats the following year has been shown by Frank Crowell of Somerset county, Me. After planting his potatoes one year on a sandy loam (a half ton fertilizer to the acre) the next year he put on oats and was able to get 60 bushels to the acre and the only extra dressing used was a little fertilizer sown broadcast. When he sowed his oats he seeded the ground down without using any more dressing or fertilizer. The next year he got a ton of hay to the acre.

He is convinced that potatoes planted first did the ground good, for he had apiece of land near this one that a little while before he had plowed up and seeded down, using about the same amount of fertilizer throughout as he had on the potato piece, but he got only about three-fourths of a ton of hay to the acre.—N. E. H.

Now is the time to get rid of your rheumatism. You can do it by applying Chamberlain's Liniment and massaging the parts freely at each application. For sale by all dealers.

HORTICULTURE.

Shrubs and Their Handling.

When shrubs are shipped from the nurseries they are carefully wrapped in moss and burlap and can be sent across the continent. When the amateur purchaser gets his bundle, he usually rips it open to see what the plants look like. He leaves the roots exposed to the air until he gets ready to set out the shrubs. Then, he digs a whole, crowds the roots, pours a pail of water over the earth and calls the job done.

Now, trees are living creatures and they need to be mighty robust to enduce such treatment. Pretty often they die. They were not given a fair deal. If they live, they are likely to be spindly and frail.

Most failures are due to one of three causes or to a combination of them all—letting the roots dry out, failure to cut back the top, and too deep planting. The shrubs may be kept safely for several days in the original package, if the roots are not exposed. If they are to be kept for some time before being planted, a trench should be dug and the plants set in it, very close together and slightly inclined toward the direction from which the sun shines, the roots being covered with earth. This is called "heeling in" and serves to keep the roots moist.

If there are several shrubs to be handled at planting time, it is well either to set them in a barrel of water or to dip the roots in a puddle of liquid manure, which will cake over them and prevent them being dried out by the wind.

Many men get poor results because of their curious mania for deep planting. Generally, a ring on the stalk will show where the plant stood in reference to the surface of the ground when in the nursery. Let it go into the earth just deep enough to hide this ring under half an inch of soil.

Lifting a plant usually deprives it of half its root growth, and the top sgould be cut back accordingly. It is just as well, in fact, to have rather less top than root at the beginning. Cutting back to this extent may seem a drastic measure, but it really is of vital importance. The roots themselves should be trimmed smooth at the ends, if they have been broken off, and should be carefully spread out in a wide circle. This means, naturally, that a wide hole should be dug. To get the best results, the soil should be thoroughly dug up, just as if annual garden plants were to go into it. Well-rotted stable manure may also be worked in to provide entirely willed, the earth should be well compacted with a maul of the foot. A slight depression to hold the water may be left around each shrub.

Put into the ground after this manner, one need have little doubt about his shrubs living and prospering. And in all the essential features, the process to be followed in planting trees is the same. Most shrubs look best when massed, and should therefore be planted thickly, and some of them removed when they get large enough to crowd each other. No sort of planting dresses up the home grounds to better advantage than shrubs, and fear of not making them live need deter no one from ordering a supply. The nurseries are busy places in the spring and mistakes may occur in a rush season.

As for the pruning of shrubs, it is not so much a matter of how to do it and when. Many a garden lover has conscientiously gone over his choice shrubs every spring, and then has marvelled that they have failed to bloom except in a half-hearted way. The truth is, of course, that he has cut off a large proportion of the buds All the shrubs that flower in the spring or early summer make the same summer the wood on which the next season's flowers are to be produced. It follows, then, that the lilacs, Japanese quince, bridal wreath, flowering currant, weigela, syringa and such early flowering plants should be trimmed immediately after they have blossomed. On the other hand, the late blossoming kind like the hydrangea and althea (Rose of Sharon) may be pruned in winter or spring.

When the shrub has been set in the hole, the soil should be carefully worked in around the roots so as to leave no open spaces. The end of a lathe is excellent for pressing the soil into the interstices. When half full of earth, a pail of water may be poured in, not so much because water is needed by the plants as to firm the soil over the roots. When the hole has been filled in.

In most cases, the trimming should not be severe. Some gardeners are too fond of the knife. Nipping of the branch ends is a common mistake. The real purpose should be first to cut out the old and dead wood, getting the pruning shears as close to the bottom of the plant as possible. Then, some of the new wood may be cut out, if necessary, and the branches trimmed back if they are growing out of bounds. Usually, very little of this work is needed.

The hydrangea, however, is somewhat of an exception to the general rule. This shrub may be cut freely to secure special results; it is one of the most obliging plants imaginable. If wanted for massing in a bed, it needs merely to be cut back almost to the ground.

Save Trees Girded by Mice and Rabbits.

Notwithstanding the fact that most of our growers took the necessary precautions to protect their trees this past winter from the invasion of mice and rabbits, upon investigation many were found to be damaged to a depreciable extent. Are we going to make an effort to save those trees or shall we let them die? In the first place, it will not be necessary to lose such trees, no matter how bad the injury if we will apply ourselves immediately. By resorting to any of the following methods the trees may be saved.

First, if the injury extends only around a portion of the tree and is near the base, it will heal over in one or two seasons, by banking up the soil over it. This should be done before the wood becomes dry. The soil should be piled about a foot high and pressed firmly around the base of the tree. In case the wound cannot be covered with soil, it should be covered with soft grafting wax and wrapped with three or four layers of burlap. New bark should soon form under the cover if the exposed surface has not become too dry. Trees completely girdled have been saved in this way.

Girdled trees can also be saved by sawing off below the injury and cleft grafting the stub. If the stub is over an inch in diameter, two scions should be inserted which will hasten the healing of the wound. At the close of the first season the weaker one is removed. From the scion inserted, a strong tree will be developed in two or three years. Trees that have been saved in this way will come into bearing about as soon as others not girdled, set at the same time.

Another way to save the trees, if the injury extends completely around the tree, is by bridge grafting. By this system, scions, which have been cut to a wedge ar each end as for cleft grafting, are inserted in the live bark through openings cut above and below the wound. These scions will carry over the sap until the wound is covered. The scions should be about two inches apart. After setting the scions, the parts are waxed and then everything is covered with burlap. This operation should be performed before the buds have started to swell.

A good wax to use for this kind of work is made of the following ingredients: Resin, 1 lb.; tallow, 1 oz.; alcohol, 8 oz. To make this alcoholic wax melt the resin and tallow together. Then remove from the fire and add the alcohol after allowing the liquid to cool somewhat. Stir until a thick paste is formed. In order to keep the wax in paste form it will be necessary to place in closed receptacles.

Improve Your Potatoes.

It has been demonstrated that the selection of the best tubers, regardless of hills, results in higher yields of potatoes than the selection of the best hills ordinarily done.

The tuber-unit method, may, however, give still better results. One carefully selected tuber is used as a starting point, or many may be similarly treated if desired. The tuber selected is cut lengthwise into four pieces from which four hills are grown. If many tubers are used, the best groups of four hills, each from a single tuber should be selected at digging time for use in planting the next year. Keep each group separate, and decide which is the best principally on the basis of the yield and the desirability of the tubers. Selection is continued from year to year by saving as many as possible of the tubers from the best groups.

Laying Out the Garden.

If possible, the garden should be close to or a part of a cultivated field, and so laid out that it can be cultivated by horse-power. It is preferable to run the rows the long way of the garden, and to so plan it that vegetables of similar growth will be together; for it is easier to cultivate if the rows are the same distance apart. Room for turning must be left at the end of the rows. The perennials, such as asparagus, rhubarb and the fruits, should be placed at one side, so as not to interfere with cultivation.

Buy Roofing
For What It Protects

Let's have a little cold-blooded reasoning. You've got several thousand dollars' worth of perishable property under cover. A little dampness—a trickle of rain—might cost you more than the price of a dozen roofs. Same next year. In 20 years one good roof will protect a fortune. In one year a poor roof may destroy it.

Now—can a roof be too good? Is it a thing to bargain about—to buy with narrow-minded economy?

When you can secure for only a *little* more the absolute protection—the positive insurance—which NEPONSET Paroid Roofing gives, can you afford to experiment with cheap, bargain roofings?

NEPONSET
Waterproof Building Products

Roofings
NEPONSET roofings are a fire protection, leak-proof and long lived. Any one can lay them. NEPONSET Paroid Roofing is for general use. NEPONSET Proslate Roofing is an ornamental roofing for dwellings. Attractive colors.

Building Papers
If NEPONSET Waterproof Building Papers are built into walls and floors, the building will be warmer, will cost less to heat and will last years longer. Recommended by architects, engineers and building owners everywhere.

Wall Board
NEPONSET Wall Board is a scientific product which takes the place of lath and plaster; comes in sheets 32 inches wide. Remember, it is the only wall board with waterproofed surfaces that requires no further decoration. Anyone can put it up.

Are you going to build? Write for valuable information about modern ways to waterproof and weatherproof. Send for samples, free booklet and name of nearest NEPONSET dealer.

Injurious Insect and Pest Act.

AN ACT TO PREVENT THE INTRODUCTION AND SPREAD OF INSECTS, PEST AND PLANT DISEASES, DESTRUCTIVE TO VUGETATION.

(Passed 20th March, 1913.)

Be it enacted by the Lieutenant-Governor and Legislative Assembly, of New Brunswick as follows:

1. This Act may be cited as the "Injurious Insect and Pest Act, 1913"

1. In this Act and in any regulation made thereunder, "Vegetation" shall mean any tree, shrub, vine or plant, or the fruit on any other portion of a tree, shrub, vine or plant.

"Inspector" is a person appointed for the carrying out of the provisions of this Act, and the Regulations made thereunder.

3. The Lieutenant-Governor-in-Council may make such regulations as are deemed expedient to prevent the introduction into the Province of New Brunswick, or the dissemination therein of any insect, pest or plant disease, seriously injurious to vegetation.

4. Such regulations may provide:

(a) For the prohibition generally or from any particular country, region or place, of the admission into Province of New Brunswick, or any vegetable or other matter likely to introduce into the Province any such insect, pest or plant disease.

(b) The terms or conditions upon which any such vegetable or other matter may be admitted into the Province of New Brunswick.

(c) For the treatment and method of treatment to be given to any vegetation, vegetable matter or premises, to eradicate, control or prevent the spreading of any insect, pest or plant disease, seriously injurious to vegetation, and may prescribe whether such treatment shall be given by the owner or by a person appointed for such purpose.

(d) For the prohibition of or treatment prior to the sale as disposal of any vegetation or vegetable matter infected with any such insect, pest or plant disease.

(e) The occupier of the premises on which is discovered any such insect, pest or plant disease, shall immediately notify the Minister of Agriculture, and shall also send specimens of such insect, pest or plant disease, to the said Minister.

(f) For the confiscation of any vegetable matter and the container thereof, if any, in respect of which a breach of the Act, or any regulation made thereunder is committed, and generally for any other purpose which may be deemed expedient for carrying out this Act, whether such regulations are of the kind enumerated in this section or not.

5. The Minister of Agriculture may appoint inspectors or other officers for carrying out this Act and the regulations made thereunder, and such inspector or other officers, so appointed, shall act under his direction.

6. Any inspector or other officer so appointed may eneter in or upon any place or premises in which there is reason to believe that any such insect, pest or plant disease exists.

7. The Minister of Agriculture, upon the report of any inspector as to the existence of any such insect, pest or plant disease, in any locality defined in such report, may prohibit the removal from such locality of any vegetation, vegetable or other matter, which is likely to result in the dissemination of such insect, pest or plant disease.

8. Any person contravening or neglecting to carry out, or offering any hindrance to the carrying out of any provision of this Act, or of any regulation made thereunder, shall be liable, upon summary conviction, to a fine of not less than twenty dollars nor more than one hundred dollars, together with costs, and in default of payment, to imprisonment for a period of not less than ten, nor more than thirty days.

9. The Lieutenant-Governor-in-Council may, by order, direct the inclution in the provisions of this Act of any insect, pest or plant disease, seriously injurious tp vegetation.

10. Every Order-in-Council and regulation made under this Act, shall be published in the Royal Gazette in two consecutive issues.

THIS IS THE WAY YOUR HENS WILL LAY WHEN YOU GIVE THEM

International Poultry Food

Right now is the time to feed INTERNATIONAL POULTRY FOOD. Hens need the tonic effects of this wonderful egg producer to start them laying and to keep them laying. Ordinary feed is not enough to make hens lay regularly.

INTERNATIONAL POULTRY FOOD pays for itself—over and over again—in the increase in eggs. It is not an ordinary food, but a tonic, purely medicinal. It actually produces more eggs—keeps fowls well and vigorous—prevents Chicken Cholera—cures Roup. Just feed INTERNATIONAL POULTRY FOOD and see how it increases your egg production.

Write telling us how many chickens you have, and what other stock, and we will send you free a copy of our $3,000 Stock Book. You need it on the farm.

International Poultry Food and Poultry Remedies also International Stock Food and Veterinary Preparations are for sale by Dealers everywhere. If your Dealer cannot supply you, write us direct.

All our goods are sold under a spot cash guarantee of your money back if not satisfied.

Herds.

No garden is complete without some of the herbs. Among the best for use are mint, sage, lavender, summer savory, thyme, annis, corlander, dill and winter savory. Directions for sowing these are given, as a rule, on the package in which the seed comes. The seed may be sown in boxes or flats early in spring; and, as soon as the plants are large enough, they may be transplanted to a permanent place in the garden. One-year-old plants of most of these herbs can be purchased from the nursery, which will save some time.

It's easy to insure a bumper crop

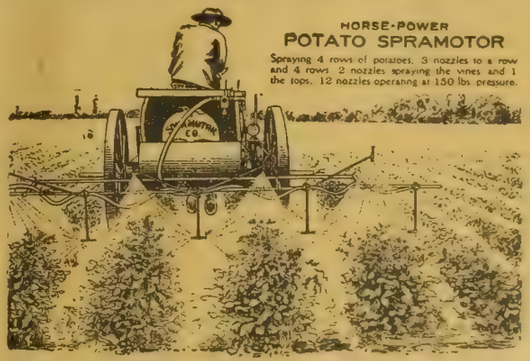
Costs little to do so, because—You can make that and large profits equally certain with a

Hand Power Spramotor

A machine that will return the money invested in it every year and then some.

A Hand Power Spramotor sprays an acre of potatoes *effectively* in 30 minutes—annihilates bugs, germs and pests and make the blight impossible. Making your work *vastly more profitable* than ever before.

The Hand Spramotor has two lines of 10 foot hose—couplings attached, patent valves, two bamboo extension rods with internal brass tube, brass cupped ends, patent drip guard and two nozzle clusters.



A *durable* machine for all purposes — destroying weeds spraying orchards and can be used effectively for whitewashing or painting the buildings about the farm.

Note:—There's a Spramotor *built for your exact* requirements. Prices range from $6.00 to $350.00. You owe it to yourself to find out all there is to know about it. We forward you the facts with our treatise on "Crop Diseases" without placing you under any obligation to buy.

It Pays to Advertise in the Maritime Farmer.

DAIRYING.

The Pure Bred Dairy Sire.

For the farmer who milks cows for profit there is probably no question which comes closer to his pocketbook and interests him proportionately that that of the purebred sire, says P. B. Bennetch in Kimball's Dairy Farmer. There are, however, still a lamentably large number of farmers who have not discovered that they cannot possibly afford to use any other than a good, purebred sire where they are raising heifer calves to take a place in the herd or for selling, and all this in spite of the large amount of agitation in favor of such sires.

The farmer with a herd of common cows realizes what it costs to purchase good cows to replenish the herd, when he has to pay upwards of $108 apiece for cows without any guarantee that the cow purchased will be a good one until tried at the pail. There is at present and probably will be for some time to come keen demand for good dairy cows, and the time when such cows can be purchased for $35 or $40 is past. All this means that we will have to raise more heifer calves in the future, and, when we remember that it costs as much to raise a poor heifer as to raise a good one, we realize just how important it is that we at least attempt to raise only the heifers from our best cows, and that we pay more attention to the sires that we use.

There are three kinds of sires which the dairyman can keep in his herd—a scrub, a grade or a purebred—but there is only one kind which he will keep if he does not want "just calves" and means business, and that is a purebred sire. It costs about as much to feed one as another and the advantages to be derived from keeping a good, purebred sire are so great that it is nothing less than a calamity to keep anything else where heifers are to be raised. As farmers, we must realize that a scrub bull is good only for sausage and that we simply can not afford to keep him.

It is an old saying that "the sire is half the herd," or in other words, he gives half of his blood to every offspring in the herd. The first cross of a purebred sire with common cows will give heifers with half of the same blood as the sire. The second cross gives heifers with three-fourths, the third cross heifers with seven-eights, the fourth cross heifers with fifteen-sixteenths of the same blood as the sire, and so on until the "scrub" blood of the original dams is almost entirely eliminated in the sixth generation.

If we assume that these original common cows give 5,000 pounds of milk per year, the first cross heifers should give at least 6,000 pounds, provided the sire used was a good one. This increase alone at $1 per hundred is worth $10 and, assuming 20 cows and half of their offspring heifers, each year the 10 heifers would give an increase of $100 the first year in milk over what their dams produced, and these heifers will be good for five or six years and alone would give a total increase over their dams of about $500. To this we must add the increased value of all the heifer calves which this purebred sire would produce, and it is an easy matter to see where in a few years a purebred bull will be a money maker, worth many times his cost. A good sire of any one of the dairy breeds can be purchased for a reasonable price and it is a very short-sighted policy to use a scrub sire simply because he costs $50 or $100 less. We must remember that the scrub sire in the dairy herd is too dear at any price.

We may ask why it is that the pure bredsire gives so much better results than the scrub or grade. This is not a new theory by any means. It is the law of heredity that like begets like and that to improve by breeding we must always breed for the best.

After deciding on the breed you want a calf out of a well-bred cow with a good milk and butterfat record. Sometimes it is possible to secure a mature bull at a reasonable price and it is desirable to do so when possible, because then you can judge the bull himself, you can judge him by his dam and by his daughters and what they are doing.

As for the individual which you select, he should be uniformly well bred, should be well reared, active, vigorous, and, if mature, above the medium of the breed in size. He should not have the feminine appearance of the cow because such a sire is certain not to be able to transmit any of the good qualities back of him. In other words he should be strongly masculine and have a general dairy conformation, and not the tendency to beef. He should also have the general breed characteristics, such as color and conformation. The most important point to consider, however, is the ancestry and the four principal dairy breeds have systems of testing their cows so that it is not necessary to depend on private records of production.

There is another value of the purebred sire as contrasted with the scrub sire. Hiram Smith, of Wisconsin, is reported as having said: "A registered sire is a great educator. It is an upward step." We can all see the influence that the purebred sire has. The man who keeps him almost always is a thinking farmer, one who is progressive and uses his head as well as his hands. We are known by the company we keep and we cannot afford to keep company with either scrub bulls or scrub ideas.

Better ideas lie at the bottom of all betterment, and when a man buys a registered sire he gives notice to the world that he is making progress in his ideas of cattle, and that he will think towards improvement in other things.

Then, again, how much more pleasure there is in raising and developing heifers which are at least part purebred. With more intelligence added to animal breeding and the consequent use of more purebred animals, there will be less trouble in keeping our boys and girls on the farm, because it will be both more profitable and pleasanter. For the dairy farmer with average means there is no quicker or more certain way to success.

For herds of 10 cows or less, it is a good plan for two or three farmers to combine and purchase a good sire, as one sire will be sufficient for 30 to 40 cows. It is also important that in the same community farmers breed the same breed, making it easier to co-operate in breeding and selling surplus animals. When a sire has proven himself to be a good one, as indicating by the producing qualities of his daughters, never part with him unless to prevent too close breeding where this must be avoided. Proven sires are valuable and there are many in use, more particularly in purebred sires which are 10 to 15 years old.

Difficult Churning.

At this season of the year the experiment station receives a large number of inquiries in regard to the difficulties of churning cream into butter. The inquirers complain that they churn their cream for a considerable period of time but that the butter will not "come."

This difficulty may be due to several reasons, which may be enumerated as follows:—

At this time of the year and particularly a little earlier than this, there

Heavy Cream

Mr. J. W. McGhee of Conover, Ont., says: "I find that the Standard cream separator will deliver any density of cream with either warm or cold milk, and still flush out easily." So if you want heavy cream, simply turn a screw on the top disc of the

Standard

and get any thickness desired. This cream-regulating screw is placed on the top disc for your convenience, so that you do not need to take the bowl apart to reach it. This point may not seem very important to you. We mention it merely as an example of how carefully and thoroughly the Standard is built down to the smallest detail. A booklet, explaining the entire construction of the Standard cream separator, and telling why it has earned the name of "The World's Greatest Separator," will be mailed free as soon as we get your name and address. Drop us a post card today.

M-L FLAT-WALL COLORS

HELP TO DECORATE YOUR ENTIRE HOME FREE

WALL and ceilings of every kind may be decorated in the most pleasing effects by the use of **Maple Leaf Flat Wall Colors.** They appear equally as well on smooth plaster, sand finished plaster, stucco walls, wall boards of all kinds, metal ceilings, burlap or decorators cotton. They produce a soft, velvet-like richness of color which is pleasing, artistic, yet restful to the eye. Border or panel effects carried out with **M. L. Stencil Designs** over **Flat Wall Colors** complete by far the most satisfactory method of wall treatment. But above all this their greatest value is that they are the most

SANITARY AND ECONOMICAL

M. L. Flat Wall Colors are oil paint colors, without gloss, and will outlast all other means of wall decoration two or three times over. Colors do not fade, are more durable and do not have to be removed to be renewed. Just another coat and the decoration is new again. Then too, they are waterproof; washing frequently with soap and water will not injure them, but freshens them up. This makes them of great hygienic value besides allows the housewife to keep her wall decoration clean and new all the time.

Twenty beautiful shades to choose from. Anyone can use M. L. Flat Wall Colors with delightful results.

How To Make Your Home Cozy

The advice of our M. L. Decorative Aid Dept., on the choice of the most harmonious colors, the selection of the best materials and how to apply them is **Free.** Mail this coupon to-day for our book "The Wall Beautiful and Hygienic" which tells how this free advice may be obtained. We tell you how to decorate your home in the most attractive way.

Poor appetite is a sure sign of impaired digestion. A few doses of Chamberlain's Stomach and Liver Tablets will strengthen your digestion and improve your appetite. Thousands have been benefited by taking these Tablets. Sold by all dealers.

is no green feed which may be fed to the cows, except silage. The dry feed causes the butterfat to assume a hard, white condition. The fat occurs in the cream in the form of little globules or balls. It is necessary that these little globules shall stick together in large masses to form particles of butter. When the cows are on dry feed these little particles become hard and will not stick together. A ration composed of corn meal, cotton seed meal, corn stover and dry hay is particularly calculated to cause a hard condition of the fat. Silage will help to some extent in reducing the hardness. Linseed meal also tends to cause a softer fat.

When the cows get on grass in the spring the difficulty of churning is soon eliminated because the green grass softens the fat.

One of the most frequent causes of long churning is thinness of the cream. The cream should be rich in order that the globules may be brought close together and the butter gathered readily. In the summer the cream may be frequently churned at a temperature of 58 degrees F., but in the winter we find at the Experiment Station that it is necessary to churn the cream at a temperature of about 62 degrees. A higher temperature serves to soften the fat and causes it to churn more quickly. Thirty per cent cream which has been carefully held at a temperature of 75 degrees for twenty-four hours will ripen and be ready for churning. The ripening will help materially in decreasing the length of time required to churn the cream, also this ripening gives the butter a delightfully mild acid flavor. The ripening in addition causes all the butter to churn out of the cream and therefore, there is very little loss of butter in the resulting buttermilk.

Cold cream often foams and will not churn. Two hours before the cream is to be churned the temperature should be reduced from 75 degrees F. to 62 degrees F. It requires this length of time for the butterfat to [illegible] throughout.

Difficult churning is sometimes caused by the fact that the cream becomes contaminated with undesirable bacteria that prevent the growth of the desirable kind of lactic acid bacteria. Therefore, it is highly advisable to carefully wash and scald the milk utensils after using them.—J. J. Hooper, Kentucky College of Agriculture.

Does Record Making Injure Cows?

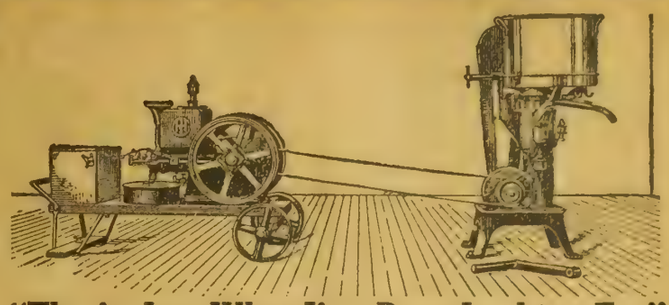
I have often been asked if the forcing of a cow for a big record is not apt to injure her? I feel certain that there is a danger of injuring the health of a cow by getting a little too anxious while making large records and feeding beyond tne danger point. On the other hand, there is nothing that will tend to the building up of a dairy cow like feeding for records. Of course, the cow must be in the hands of a good, but not over anxious, feeder; by over anxious I mean one who desires to get a little more milk from his cow and knows there is a chance of doing so by feeding more, but may not know just where to draw the line in order to preserve the health of his cow. The old saying, "It is the last straw that breaks the camel's back," holds good here.

We consider that the greatest danger of cow injury comes in the long-time records, especially with heifers. We do not believe the short-time records to be as injurious as the yearly records. With the short-time records one may make a large record from a cow year after year and still give her a good rest from heavy feeding between records, while with the long-time records the cow does not have the rest from heavy feeding.

I do not mean to discount the value of yearly records. I consider them to be the most valuable records we have. But in making the large records it is very necessary for the feeder to thoroughly understand what his cow will stand without overdoing her.

I will illustrate by a grade cow that we raised. She was an extra good heifer, and naturally we were especially interested in her welfare. She never made a poor season and was always well fed. I can remember that some of our neighbors remarked, while she was in her prime, that she would not last long because she would wear herself out. When this cow was in her fourteenth year we put her in a dairy test at London Fair, where she won first place, competing with all breeds and ages. When in her fifteenth year she made the best year record she ever made. There is nothing that will develop a heifer and make her a large producer as will testing her.

In feeding for records the offspring of the cow may be affected if the cow is dry for some time before freshening and loaded with fat. We have never had a weak calf ourselves. If we want a good horse, we will feed him well from the time he is foaled, then when he is old enough give him plenty of work to harden him without overdoing him. If we want a good cow we start when she is a calf, feed her well, and when old enough, feed and milk to her capacity, but never overdo it.—George Laidlaw, in Farm and Dairy.



"That's Just What I've Been Looking For"

WHILE we were getting the opinion of farmers on our new cream separator power outfits, one of them said: "I have been looking for such a combination as this for a long time. I need an engine with that kind of a gear on it to slow down the speed. There are half a dozen small machines on my farm for that engine to run. I want that outfit." You, too, will want it when you see it. The outfit consists of an

I H C Cream Separator
Dairymaid or Bluebell

and a one-horsepower back-geared I H C engine. The engine is mounted on a portable truck, and can be used for any farm work to which power can be applied. The back gear adjustment runs at the proper speed to operate any hand turned machine.

The working parts on I H C cream separators are accurately made and all bearings are well lubricated. The shafts and spindle are the strongest used in any separator. The gears are easily accessible for cleaning. Both separators have the famous I H C dirt-arrester chamber.

See the I H C local agent and ask him to explain carefully all of the good points of these outfits. You can get catalogues and full information from him, or, write the nearest branch house.

LIVE STOCK.

Distribution of Pure Bred Male Animals by Department of Agriculture Ottawa.

Realizing tde inability to secure the use of well-bred male animals is at the present time one of the greatest difficulties standing in the way of live stock development in many parts of Canada, particularly in the newly settled districts, the Dominion Department of Agriculture, through the Live Stock Branch, is this year undertaking a widespread distribution of pure bred stallions, bulls, rams and boars. The original cost of the animals will be borne by the Department and they will be placed in the hands of such local organizations as agree to the conditions governing the distribution. In a word these sires will remain the property of the Department, but the local associations will be responsible for their proper maintainence and management under the general supervision of officers of the Live Stock Branch. In the case of stallions, the members of the associations will also be required to pay a fee covering an annual insurance premium.

All animals distributed will be bought from home breeders and will be Canadian bred. As far as possible, they will be purchased in the province in which they are to be placed. In this way Canadian breeders will receive encouragement and their market will be increased not only directly but also indirectly through the emphasis given throughout the country to the value of pure bred sires. It may be added that it is not the intention to place the animals in districts where suitable male animals of the same class are already owned by private individuals. The aim is rather to aid sections where pure bred sires are lacking and as well to encourage new communities in following a proper and intelligent system in breeding.

All bulls distributed will be purchased subject to the tuberculin test and only stallions which have passed a rigid veterinary inspection for soundness will be selected.

In order to take advantage of this form of assistance, it will be necessary for interested parties, in any section, to undertake the organization of a local association, in whose hands such sires as are required may be placed. Complete information regarding the rules and regulations governing the distribution may be made upon application to the Live Stock Commissioner, Ottawa. Whenever possible, an officer of the Branch will render assistance in the perfecting of the necessary local organization.

Water for Swine.

Swine need plenty of pure water to drink, even though they get slop two or three times daily writes a large swine grower in an exchange. To compel them to drink from mud holes or from dirty troughs is not conducive to good health and rapid growth.

Any trough system yet devised is not wholly satisfactory. Hogs will get into troughs in hot weather, and although many cleats may be nailed across to keep them out, dirt soon soon collects in them, cleats are broken, water slopped over until a mudhole is made about the trough, and it becomes unhealthy and unsatisfactory.

One method that gave satisfaction and was cheap was the automatic stock waterer. This took the place of everything else on the farm, because it was cheap, simple and indestructible, and furnished pure water at any and all times when hogs wanted it, and during hot weather the little device was kept busy.

A stock waterer is all iron, and is attached to any water-tight barrel. It works automatically, filling itself as the animal lowers the water in the basin. A barrel with the waterer attached can be located anywhere and kept filled by means of pails or pipe connected with the big stock tank. All that is necessary is to keep the barrel full; the hogs do the rest.

There is nothing to get out of order about a waterer. Hogs cannot break them nor interfere with their working. They save time, and the barrel may be filled once a day, instead of lugging water three times daily.

Even though it is necessary to fill the barrel by hand, it is quickly done at any time, as the barrel is not usually located far from the supply. Some farmers connect the barrel and stock tank, and simply turn a faucet to fill the barrel.

When one must be away from home for the day, the hogs have a supply of clean water for the day. No disease germs can be conveyed through a stock waterer unless they are first put into the barrl or tank. Such a waterer is better than a running stream, because the water comes from the well and is not liable to contaminatination from sources up stream.

It is a good plan to make a small platform of old barrels upon which the barrel is placed. This keeps it level and the little water that the hogs will slop over in drinking will not make a mudhole.

Contagious Abortion.

The annual loss sustained by horse breeders from contagious abortion continues undiminished. The veterinary profession have not made much headway in combating the disease among mares, but some very interesting results have lately been published by W. J. Taylor, of the Montana Experiment Station, reviewing his experiments on cattle.

It has been recognized for some time that carbolic acid taken internally or injected under the skin had valuable preventive and curative properties in cases of certain microbic diseases. It has been further established that contagious abortion is caused by agerm that enters the system and lodges in the productive organs of the female, causing premature separation of the foctal membranes from the uterus.

Three herds were experimented on by Dr. Taylor and in every case the carbolic acid treatment was an unqualified success.

In administering the acid a four per cent solution was used. That is, a given weight of crystals was dissolved in twenty-five times the same

Amatite ROOFING

It Takes The *Pain* Out Of Painting

IT'S certainly a painful process to keep on painting a roof every two or three years—you feel it in your back and in your pocketbook.

Amatite Roofing never needs painting—sounds almost too good to be true, doesn't it.

Just lay it with an ordinary hammer, and you've solid roof comfort ahead for many years to come.

Costs less than similar roofings of same weight. The mineral surface is also fire-resisting.

Sample showing the pitch waterproofing and real mineral surface free on request.

357 Yonge Street, Toronto, Can.

weight of water. This was mixed with the meal fed. It was found that cows would eat up to as much as 750 lbs. daily with apparent relish.

Cows were started on small quantities during early pregnancy, say 100 cc. daily for ten days each month. This was increased as seemed necessary with advancing gestation up to usually 500 cc for the last month. If signs of abortion appeared, the internal dose was supplemented with injections in the thin skin behind the shoulder. The injections varied in quantity from 50 to 60 cc.

It was found that in cases of impending abortion, carbolic acid can be injected in sufficient quantity to cause staggering gait and dilation of the pupil of the eye with no apparent unsatisfactory after-results.

Heifers pregnant for the first time are more liable to abort than during subsequent periods of gestation and should be carefully watched and vigorously treated if abortion exists in a herd.

Angora Goats.

During the past few months the Live Stock Branch of the Dominion Department of Agriculture has been in receipt of numerous inquiries as to where it might be possible to purchase either Angora or Milch goats. It would appear that in many parts of the Dominion the demand for these useful and profitable animals is rapidly developing and that those who at present have any surplus stock can find a ready sale for them is a channel of communication between supply and demand is established. Accordingly as the means of starting a convenient Directory of Canadian Breeders of Angora Goats and Milch Goats, the Live Stock Commissioner will be pleased to receive from such breeders information regarding their respective flocks covering the following points:—

1. Kind and number of goats kept.
2. Usual number for sale each year.
3. Approximately the prices asked.
4. If possible a brief statement regarding expenses found necessary and the returns which may be expected by one enagaing in raising this class of stock.

Communications supplying the above information should be addressed to the Live Stock Commissioner, Ottawa, Ont. Such letters do not require postage.

Cost of Making Light ank Heavy Pork.

It is recognized by hogmen generally that the first 100 lbs. of a pig can be made for a very small amount of feed per pound of gain; that the second 100 lbs. will cost almost twice as much, and the third 100 lbs. will cost between two and three times as much as the first 100 lbs. In this way the cost per pound increases as the pig grows older and heavier. Since this is so, it must be evident that, barring cost at birth, a pound in a 100-lb. pig can be made for about one-third the cost of that required to produce a pound of gain in a 400-lb. pig. There is more substance to an old and fat pig than a young, light one, and it takes feed to make it. On the market they are all bought for the pork they will dress, consequently the difference in price per pound is not great, but the cost of producing it is, and to this the producer should give heed. That is why so many hogs today are marketed at 200 lbs. and fewer at 350 and 400 lbs. This does not imply that the hogs should not be finished or carry fat, but simply that as the weight is increased the cost per pound to produce it is increased.

The pork producer anxious to make money can do no better than turn his attention to a consideration of these and other details that may suggest themselves, and determine their application to his individual conditions.—Farm, Stock and Home.

Your Soil Is Alive

TO all intents and purposes, soil is alive. It breathes, works, rests; it drinks, and, most important of all, it feeds. It responds to good or bad treatment. It pays its debts, and pays with interest many times compounded. Being alive, to work it must be fed. During the non-growing seasons certain chemical changes take place which make the fertility in the soil available for the next season's crop. But this process adds no plant food to the soil. Unless plant food is added to soil on which crops are grown, unless the soil is fed, in time it starves. There is one best way to feed your soil. Stable manure, which contains all the essentials of plant life, should be spread evenly and in the proper quantity with an

I H C Manure Spreader

I H C manure spreaders—**Corn King or Cloverleaf**—are made in all styles and sizes. Sizes run from small, narrow machines for orchard and vineyard spreading, to machines of capacity for large farms. The rear axle is placed well under the box, where it carries over 70 per cent of the load, insuring plenty of tractive power at all times. Beaters are of large diameter to prevent winding. The teeth that cut and pulverize the manure are square and chisel pointed. The apron drive controls the load, insuring even spreading whether the machine is working up or down hill, or on the level. I H C spreaders have a rear axle differential, enabling them to spread evenly when turning corners.

The I H C local agent will show you all their good points, and will help you decide on the one that will do your work best. Get literature and full information from him, or, write the nearest branch house.

THE HORSE.

The Veterinary Examination of Stallions

At the annual meeting of the Clydesdale Horse Society, the following resolution was passed:—"That this meeting emphatically opposes any steps to be taken meantime tending to impose compulsary veterinary examination."This was because the question of compulsary veterinary examination of all horses travelling the country-side was brought forward. There had evidently been a conference in London on the subject, and a letter had subsequently been received from the Board of Agriculture and Fisheries stating that it was not their intention this session to introduce any measure requiring the compulsary examination of all horses travelling the country-side.

Some strong opinions were expressed on the subject. One might think from them that a great injury would be done to the breeders of horses if such a plan was adopted. The view was expressed that horse breeders knew better than any officials what were the best horses to breed from. It might be imagined that here could be no thought of any official ever being given any power to say what horses a breeder should use, except such as experience had proved were undoubtedly liable to produce undesirable stock.

Members of a society of such standing as the Clydesdale Horse Society may be able to get information, and may thoroughly know a horse; but what of the hundreds of breeders who keep only one or two mares and are dependent on the services of such horses as come into their districts? These breeders will probably supply the majority of horses for commercial use. Have they to be dependent on the word of the groom who is travelling an animal which is practically a "cast off" as far as serving any pedigree mare? One has known men who have boasted of having travelled stallions which they knew were suffering from some unsoundness, but by scheming they have managed to travel them the whole season through without anyone ever suspecting the fact. Can it be that the pedigree Clydesdale breeder has something to fear from the veterinary examination of stallions? Sound horses are not as plentiful as they ought to be. Those who wish to hire sound stallions or buy horses for town work say how scarce right ones are.

It could not be otherwise than good for the country if unsound stallions were prohibited from travelling. If the pedigree man does not object to the use of horses which are unsound, let them be kept at stud for their own class. One does not wish to interfere with the experts, but to protect the ordinary breeder who hopes to breed an animal which is sound at five years old and suitable for town work. We cannot think that any injustice would be done if the method adopted by the Board of Agriculture for the examination of stallions for registration were made compulsory on all that travel in the country. The veterinary surgeon who examines a stallion for registration sends his report to the Board of Agriculture, which requires him to say whether the horse is free from cataract, sidebone, bone spavin, roaring, navicular disease, stringhalt, whistling, defective genital organs, shivering, ringbone. If it is lame or sufficiently lame to interfere with its usefulness as a stallion, if free from contagious disease, what its physique and conformation are.

If the report is such that the Board will not register the stallion, the owner is informed why. If he is not satisfied, and produces a veterinary surgeon's certificate to say that the horse does not suffer from the defect on account of which registration has been refused, and deposits £2, the horse is re-examined by another veterinary surgeon appointed by the Board. If he gives the result of his examination in favor of the horse, the deposit is returned to the owner and the horse registered. Surely this would appear to be perfectly fair. The time will soon be round again when breeders will have to choose suitable horses for their mares. It costs the owner nothing to have his horse registered. Breeders should make the registration compulsory by refusing to use any stallion which is not officially registered.—Yorkshire, England.

Horsemen Attention!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Temperament of Horses.

The temperament of a horse is best understood when we take into consideration the anatomical structure of the animal. For the present we will consider the seven different systems that have a direct bearing on the character of the animal. The bony muscular, nervous, alimentary or digesting, respiratory or breathing, circulatory and lymphatic systems. The real character of the animal will depend greatly upon which system or combinations of these systems are in the lead, or rendering a dominant influence.

When we have large bones there is a large frame work that will carry the animal. But it is necessary to have the muscles to move the bones, so when we have large bones overlaid with, and controlled by, large large muscles, we have the instruments of motion in the lead and consequently we have motive temperament. Of course, there are several degrees in which the motive temperament is possessed, and the real character of the animal will depend on the degree in which he carries these characteristics. There are various modifications like the quality of the bones, the quality of the muscles, and the degree in which the nervous system acts upon the animal which should be taken into consideration.

The brain and nervous system wield such a dominating, or controlling influence over the animal that when it is in the lead, it is designated as the nervous temperament, usually carrying with it an air of refinement; there are small bones, dents, wiry muscles, with ease of action. The head is wide at the eyes, the eyes open and bright, manifesting an intelligence. There is proportionately a considesable space between the eyes and the poll, giving ample room for a large, active brain. The ears are moderate or small in size pointed at the end, and carried as if listening for the word of command. When possessed in a great degree it renders the animal restless and impatient. The thorough bred or running horse and some of the modern trotters and roadsters are good examples to illustrate this temperament.

VITAL TEMPERAMENT TO BE DESIRED.

The next we will describe properly a compound temperament. It is seen where all the vital organs are large and active, together with an active lymphatic system. We will call it the vital temperament, because the vital organs, the stomach, lungs, heart and lymphatics dominate and fix the

character of the animal. With such horses the bones are medium in size, the muscles are not so dense and hard as with the other temperaments mentioned, but give rotundity to the general form, and add grace and beauty to the animal. Such animals are tractable in disposition, easily broken to work, and are kind and faithful servants in all places where they are called upon to do service.

Horses of the vital temperament are such as are known as easy keepers. Their large vital organs enable them to utilize all the nutrient elements in their feed and the lymphatics store up all that is not needed for immediate use. They make flesh and blood rapidly when not in active service, and are the ones that fall victims to azoturia, if kept on full feed during a period of rest, and then driven or put to active work. The system becomes pletoric, more blood being formed than the system can dispose of, the vascular organs are overloaded, and, increased action, caused by exertion, they become congested.

The number of horses of the vital temperament have increased very rapidly in this country since we began to use the sires selected from the draft breeds. The grades make fine looking and serviceable animals on the farms and there is a great demand for them in the market at high prices.

To avoid heavy losses it is well to follow the following precautions' feed such horses moderately when not at work, and be sure and give them exercise at least every other day. To give such horses full rations during periods of rest, is to waste feed and endanger their lives. It is worth the while to study the characteristics of the different temperaments, and act to meet their requirements.—W. H. Underwood.

Essential Things That are Sometimes Overlooked in Grooming Farm Animals.

A good grooming is worth half a horse's feed. This saying though often quoted is seldom taken at its real value. Many a farmer who feeds his work stock with great care is often lax about seeing that their coats, manes and tails are properly cared for. With most farmers the daily grooming consists of a currying, a brushing, or a combination of the two. This is all right as far as it goes, but it is not complete enough for horses doing heavy work.

A good outline for grooming might be divided into five operations; (1) Currying; (2) Wiping with a straw wisp; (3) brushing; (4) rubbing with rags; (5) care of mane, tail and feet.

The use of the curry-comb is for the purpose of loosening up the dirt and filth adhering to the skin. It should be held firmly, but we should be careful in currying tender skinned animals not to scratch too hard as a scratched skin often results in infection.

The straw wisp is generally used just after going over with a curry-comb and consists in going over the entire horse with a little handful of

(Continued on page 588)

New Vitality For Men

USE THE

Free Coupon

Vitality gives you the manly courage to protect those depending upon you, as portrayed in the picture. No matter what thoughtless action or early indiscretion may have sapped your strength, vitality restores it to you. It makes you over into a strong, vital, manly man, without an ache, pain or weakness. Vitality puts the real VIGOR OF YOUTH into your blood; no matter how nervous or debilitated you may be, it puts the sunshine of vigorous manhood into your life; I make you feel young and keep you feeling young, without the use of drugs, without the necessity of dieting, without one bit of change in your present mode of living, except, of course, dissipation must cease. Just lead a manly life and use my HEALTH BELT; everything else will come. My HEALTH BELT, worn at night, pours a great, soft stream of VITAL STRENGTH into your blood, nerves and organs during all

the hours you sleep; in one night it takes the kink, pain or weakness out of your back, ere long friends will be saying: "How well you look," and you are answering: "Never felt better in my life!" Your eyes will sparkle with health; you will have that pleasing influence to fascinate and control which comes to all full-blooded, strong, vital, manly men. Thousands upon thousands are now using my Health Belt all over the world. With special attachments it cures rheumatism, kidney, bladder, stomach disorders, etc.

Let Me Send You This Book Free....

Here is my latest illustrated book: "Health In Nature," containing a fund of private information relating to weakness of men. All men, young or old, can read every word of this little publication with great profit. Sent to you in plain, sealed envelope by mail. The book is not not written with the idea of compelling you to use my Health Belt; it is meant merely as a guide for men, and while my Belt is fully described, there is absolutely no obligation on your part to purchase. I simply want you to read this book that you may know certain truths about all weaknesses, which have never been printed before. Vitality is the greatest thing in the world, and I can supply you with it. Pleas fill in the coupon for the free book.

In-Foal Mares INSURANCE

OF ALL the losses owners are liable to, none can be **less prevented or modified** in any manner whatsoever **than loss by foaling.** Notwithstanding the best care and attention, although a mare **may have foaled** many times successfully, she is always a cause of worry and anxiety to the owner through the fear of **losing by death** the often very **high cash value of the Beast,** not to mention service fee, care and expenses incurred for no avail. **Why risk such loss** when a payment of a few dollars in premiums would **cover you** should it happen. Reduce the amount **of the RISK** by insuring, only risking thereby the **loss of the Premium** if the mare foals allright. We issue 30 days, 6 months and 12 months policies with or without cover on foal.

Protect Your Property With Peerless Lawn Fencing

Ornamental fencing serves a double purpose. It not only enhances the beauty of your premises, but also protects it and your children, as well. It keeps out marauding animals and trespassers. It protects your lawns and flowers and always gives your property that orderly, pleasing appearance.

Peerless Ornamental Fencing

is the result of years of fence building. It is built to last—to retain its beauty and grace for years to come and should not be confused with the cheap, shoddy fencing offered by catalog houses. Peerless fence is built of strong, stiff wire which will not sag and the heavy galvanizing plus the heavy zinc enamel is the best possible assurance against rust.

Send for Literature

Shows many beautiful designs of fencing suitable for lawns, parks, cemeteries, etc.

Agencies almost everywhere. Agents wanted in unassigned territory.

POULTRY.

Sicilian Buttercups.

Since the Indian Runner duck craze has subdued somewhat, no other breed coming before the public, have made such a strong bid for favor as the beautiful new breed called Silician Buttercups.

It is true that Italy has not sent us much that is praiseworthy with her "Black Hand" but twelve years ago, she began to redeem her reputation by sending us her first consignment of these delightful "Flower Birds" from sunny Sicily.

Like many other desirable things they simply "happened. There was no astute poultryman behind the importation on the look out for something "new."

They were bought in the open market by the captain of the steamer "Fruiter" and were destined for food on the trip home, and not for the purpose of creating a sensation among our Uncle Samuel's poultrymen. How the buttercups saved their necks will always be told in their favor, and was due to the fact that they became so valuable as producers of eggs, Captain Daws decided to keep them. When he arrived in Baltimore he turned the crate of fowls over to his family, so these birds became the foundation of one strain of Buttercups. although they were not always called by that name, that was added in this country.

The other Buttercups which came by direct importation was through the late James S. Dumor, Esq., at one time U. S. Consul-General to Italy. In a recent letter from his wife, she tells me her husband kept these fowl in Italy thirty years "simply for eggs, eggs, eggs" as she puts it, and he decided to keep them in this country for the same purpose.

From an unpretentious beginning the Buttercups have been climbing upward, simply on their own merits. There has been no one behind them to boom the breed with pages upon pagesof advertising, as for instance, did Kellerstraus with the White Orpingtons, turning loose a river of printers' ink, every year, until he was selling eggs for thirty dollars a setting, two dollars an egg.

About a year ago a Buttercup Club was formed and a committee appointed to prepare a standard. But it was the avowed purpose of these men to preserve the splendid utility qualities, and not sacrifice anything to fine feathers, for finest of all the Buttercup is a utility bird, whatever they may have in the way of fine feathers is just so much to the good; as good measure heaped up and running over. As this breed has been developed for the producing of eggs, and a nice plump body, there is little variation in coloring, as not much attention has been paid to their exhibition or or show qualities. However, they breed as true to variety, as for instance, the Rhode Island Reds. They are of the same general style and type as the Mediterranean class.; but unlike them, they are quiet, and quite docile. They are splendid foragers; and it has been urged in their favor, that given good range they require no other feed than they pick themselves in summer. But if one feeds them, it costs much less to keep up a flock, and have them laying steadily, than the generality of breeds. They seem to be hardy, and in quite a large flock, they have been uniformly healthy with me, and thrive well in this climate.

In Italy they are known as "Flower Birds" and in the Island of Sicily are are sometimes called "Sicily Spots."

Mr. C. C. Loring, who is on the standard Committee, was the first to call them Buttercups, swayed, I suppose, by the American desire to improve "everything upon which it gets its hands."

There is no doubt but the breed is destined for an immense popularity in this country, due not so much to its splendid laying qualities, as to the fact of their unlikeness to any other breed, and their attractive appearance. There is no other breed witn a comb like the Buttercups, it is not single, double, rose or pea, but in its finest development looks exactly like a full blown flower—a buttercup—hence the name, that seems almost an inspiration.

The males are rich red in general color, with black tail and wing feathers; the females golden buff, with black tail, and backs more or less sprinkled with black dotes. They mature early, and there are cases on record, when birds have layed in 127 days.

The avove is a brief description of a coming breed. Birds of great beauty and utility, great layers, splendid foragers, gentle and easy to manage. Given a chance, this breed will make friends everywhere, and justify all that has been said in its favor.—Sarah E. Moses Smith, Woodwards Cove, Grand Manan, N. B.

Suggestions on Poultry for May.

Do not give any food to the chicks until they are from 24 to 36 hours old. Warmth is more important than food.

Feed them a little every two hours for about a week. After that time feed every four hours until they are a month old, then three times a day. Chicks do not eat much at a time but they eat often. Feed them at regular times and do not omit a meal.

Keep a box of fine charcoal, small grit and dry bran before them all the time and on the floor of the coops sprinkle fine sand in the cut clover and alfalfa leaves. Plenty of fresh water at all times. Give them water in something that only the beak of the chicken can become wet. Do not let the chicks walk in the water. Keep the coop and yard dry, for damp places prove fatal.

A prepared chick food, if properly balanced, contains bone, muscle and feather making properties, and can be fed for the first two or three weeks with splendid results. Just give them what they will clean up nicely.

Stale bread that has been dried in the oven and then rolled fine and moistened with milk or water enough to make the mixture crumbly is good.

Hard boiled eggs are good if you let them cook long enough. Sprinkle a little fine sand on the eggs before feeding.

Never feed raw corn meal stirred into water or milk. It causes bowel trouble and perhaps a loss of half and sometimes all your flock. Corn bread dried and rolled fine, then moistened with milk or water until it is crumbly is a good change. Never feed sloppy feed. Have it dry and crumbly.

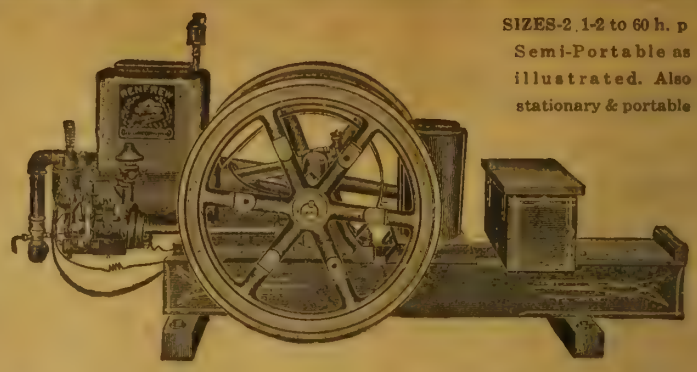
After the third week any wholesome food can be fed with good results.

Be sure to keep all feed and drinking dishes clean. Wash and scald the dishes, keep coops and yards dry, warm and clean, and you will have no trouble raising the entire flock.

A chick should weigh a pound at 5 weeks and ready for market at 8 weeks.

It pays to hurry the growth of chicks so don't let them shift for themselves as soon as you think they are well started.

When you see the chicks busy and scratching it is a sign they are happy



SIZES-2 1-2 to 60 h. p
Semi-Portable as illustrated. Also stationary & portable

Note Its Compactness

Look at the above illustration. It gives you a fair idea of the clean-cut, well-balanced, compact design of the Renfrew-Standard gasoline engine. But what we would like you to do would be to go to our agent's in your locality and see the

Renfrew-Standard

It will speak for itself. This engine has, we firmly believe, no equal in Canada. In fact, we are very sure of it.

Where, for instance, will you find another engine that starts easily without cranking in zero weather ?

Where will you find another gasoline engine with a governor equal to the Renfrew-Standard fly-ball system steam engine type ? Where, too, will you find another engine that requires so little water for cooling, or that has no pipes, fittings, cooling pumps or fans to freeze up or get out of order ?

We've no space for further particulars, so be sure to go and see the engine, or write for catalog if not convenient to call on agents right away.

Steel Trough & Machine Co., Ltd., 9 James St., TWEED, Ont.

A COLD

However Slight

MAY TURN INTO BRONCHITIS.

You should never neglect a cold, however slight. If you do not treat it in time it will, in all possibility, develop into bronchitis, pneumonia, asthma, or some other serious throat or lung trouble.

On the first sign of a cold or cough it is advisable to cure it at once, and not let it run on for an indefinite period.

For this purpose there is nothing to equal Dr. Wood's Norway Pine Syrup, a remedy that has been universally used for the past twenty-five years.

You do not experiment when you get it.

Mrs. Louis Lalonde, Penetanguishene, Ont., writes:—"When my little boy was two years old he caught a cold which turned into bronchitis. I tried everything to cure him, even to doctor's medicine, but it did him no good. One day I was advised to give Dr. Wood's Norway Pine Syrup a trial, and before he had half a bottle used, he was cured. I would advise all mothers to try it, as good results will follow. My home is never without it."

See that you get "Dr. Wood's," as there are numerous imitations. It is put up in a yellow wrapper, 3 pine trees the trade mark; the price, 25 and 50 cents. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

TRADE MARK

Ploughs—Wilkinson

REGISTERED

U. S. S. Soft Centre Steel Moldboards, highly tempered and **guaranteed** to clean in any soil. Steel beams, steel landsides and high carbon steel coulter. Clevises can be used either stiff or swing. Each plough is fitted especially with its own pair of handles—rock elm, long and heavy and thoroughly braced. The long body makes it a very steady running plough. Shares of all widths—specials for stony or clay land. The plough shown turns a beautiful furrow, with minimum draft and narrow furrow at finish. Ask for catalogue

The Bateman-Wilkinson Co., Limited
431 Campbell Ave., Toronto, Canada.

No. 3 *Sod or General Purpose Plough. 25 styles to choose from.*

and thriving.

Spray the coops often and the hen houses once a week and continue to do so through the warm weather. Dissolve ½ oz. of corrosive sublimate in a pt of hot water, then add 1 oz. of carbolic acid. Stir this into 2 gals. of kerosene. Keep it well stirred all of the time. Spray coops, roosts and houses with this several times during the summer and use it generously.

You can't neglect the chicks while they are growing and get good breeding stock by feeding them good a month or so before laying. Give them plenty of feed, good care and clean houses and yards at all times.

Do not put chickens hatched at different times together. The older ones will crowd out the younger.

Give the chicks plenty of shade to run in on warm days.

Chicks hatched this month will lay in November if you care for them right.

Mindful of Small Matters

As a rule, beginners are not mindful of the small details, and this fact has probably led up to more disaster than anything I might name. The poultry business will not suffer leaks. At the end of the first year the average beginner classes himself as an expert, and maps out a course entirely different from that followed by the practical man who has spent years of hard work and study. He will theoretically lay the foundation for an income which the expert has never been able to attain. It is not necessary to dwell upon the results.

Why is it that the fowls in the yards of successful poultry men show that healthy, pink condition? It is due to their constant watch, and promptly nipping in the bud "the first symptoms" of all ill health. The beginner aims to acquire the art of poultry doctoring—the expert exercises his wits in the art of prevention.

The expert does everything in a systematic way, is regular in all his duties, never postpones any duty, is constantly looking ahead, and stays ahead in his work. He makes repairs before they become dangerous leaks, and in a rather slow but careful tread goes about his work that he may do all things well.

The amateur, especially if his living does not solely rely upon his labors, looks upon the mindfulness of these small matters as trivial, but sooner or later he finds that they mean good health, good condition, and good returns.

It is not such a severe task to drive out a small army of lice, but when house is filled to overflowing it becomes hard work and work that is not always completely satisfactory.

Allowing dirt and filth to accumulate, is not only a breeder of lice but also of disease.

Allowing piles of wood and rubbish to heap up nearby the buildings, affords a safe hiding place for rats, minks, weasles, and other poultry enemies.

Allowing houses to remain open at night, nothing secure, affords a strong temptation to midnight "poultry raisers."

The price of roofing may be saved for the time being by not repairing the holes here and there, and some labor may be avoided by allowing the cracks to remain in the walls, but when the rain comes down, and the drafts of cold air blow through, there may have to be double the amount of labor spent to save the afflicted stock. For surely such conditions must have their dire results.

How revolting is a hen house where the manure is allowed to pile in pyramids under the roosts, where cobwebs form draperies, where lice and mites find roosting places. Can such a condition speak well for the enterprise of the man in charge?

If idleness, shiftlessness and uncleanliness were roads to wealth, what a large array of rich men we would have. He who is a shiftless business man, a poor manager, one of those forgetful, inactive kind will find the poultry business is one of the worst businesses for him.

If a gradual growth is made, the start being limited, all the details watched and the lesson studied well, the business is surely started on a firm foundation. Anything else makes a risk.

Geese do not relish tall woody grasses, which have become tough, In a wild state they devour large quantities of roots of grasses and acquatic plants which they dig from the banks and borders of streams and wash free from earth in the shallow water. Domestic geese generally feed upon pastures, preferring moist, rich localities where the grass is kept short and sweet by constant feeding and rapid growth.

The hen furnishes a manure rich in nitrogen, and to get the most benefit out of it there should also be applications of potash and phosphate. Wood ashes will supply the potash, and can be mixed with the manure, it having a tendency to conserve the ammonia. Lime should never be mixed with the manure.

It is claimed that a freshly laid egg placed in bucketful of water will sink to the bottom; one day will sink nearly to the bottom; two days old about half way up; three days old, will float not quite at the top; four days old, just touch the top; five and six days, rise a little above the top, rising a little higher as it daily grows older.

It requires three months or more to grow a broiler, much depending upon the weight desired, the stock and the care. Broilers shrink about a half pound each when dressed.

In killing and dressing poultry, handle gently to avoid bruising. Discoloration quickly follows a bruise, and diminishes the market value of the property.

A broiler should have a good, plump breast, broad back, clean yellow legs and yellow skin, and small comb. Such is the American epicure's idea, but these requirements bar out such breeds as Brahmas, Cochins, Langshans, or any crosses on them, on account of the feathers on their legs. They bar out all white-skinned fowls, and put a damper on all large comb birds, like Leghorns, Minorcas, etc. Such being the case, the Wyandottes have easy sailing; and, besides being quick growers are more desirable for this purpose. Markets are, as a rule, very particular and while

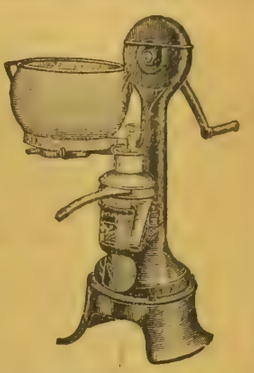
Cut Your Work in Two

By starting in to use a large capacity

Waterloo Boy Cream Separator



The favorite everywhere it goes. Note the heavy compact construction, with low down handy supply can.

The 900 lb. size Waterloo when at speed and skimming takes no more power than the ordinary 500 lb. size separator of other makes.

The large capacity Waterloo hand separator will save you time, labor and expense, because it will cut the labor of skimming the milk more than in two, not only because it turns easier than most other hand separators, regardless of capacity, but because it does the work in half the time.

In these busy days, when labor is so scarce and so expensive and so unsatisfactory, a saving in time is a great direct saving in money to you.

Please write us a post card to-day, asking for Free book describing this cream separator.

The Sussex Motor Co., Ltd.,
SUSSEX, N. B.

We have for sale a few second hand machines of other makes that we have taken in exchange for our Waterloo Boy. Come in and see them.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

The Man Who Wins.

The man who wins is an average man
Not built on any peculiar plan;
Not blest with any peculiar luck—
Just steady and earnest and full of pluck.
When asked a question he does not "guess;"
He knows, and answers "No" or "Yes";
When set a task that the rest can't do,
He buckles down till he's put it through.
Three things he's learned—that the man who tries,
Finds favor in his employer's eyes;
That it pays to know more than one thing well;
That it doesn't pay all he knows to tell.
So he works and waits, till, one fine day,
There's a better job with bigger pay;
And the men who shirked whenever they could,
Are bossed by the men whose work made good.
For the man who wins is the man who works,
Who neither labor nor trouble shirks;
Who uses his hands, his head, his eyes—
The man who wins is the man who tries.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

"Now, David," said Mr. Murdstone, "a sullen obdurate disposition is, of all tempers, the worst."

"And the boy's is, of all such dispositions that I have ever seen," remarked his sister, "the most confirmed and stubborn. I think, my dear Clara, even you must observe it?"

"I beg your pardon, me dear Jane," returned my mother, "but are you quite sure—I am certain you'll excuse me, my dear Jane—that you understand Davy?"

"I should be somewhat ashamed of myself, Clara," returned Miss Murdstone, "if I could not understand the boy, or any boy. I don't profess to profound; but I do lay claim to common sense."

"No doubt, my dear Jane," returned my mother, "your understanding is very vigorous."

"Oh dear, no! Pray don't say that" interposed Miss Murdstone angrily.

"But I am sure it is," resumed my mother; "and everybody knows it is. I profit so much by it myself, in many ways—at least I ought to—that no one can be more convinced of it than I am myself; and therefore I speak with great diffidence, my dear Jane, I assure you."

"We'll say I don't understand the boy, Clara,'- returned Miss Murdstone, arranging the little fetters on her wrists. "We'll agree, if you please, that I don't understand him at all. He is much too deep for me. But perhaps my brother's penetration may enable him to have some insight into his character. And I believe my brother was speaking on the subject when we—not very decently—interrupted him."

"I think, Clara," said Mr. Murdstone, in a low grave voice, "that there may be better and more dispassionate judges of such a question than you."

"Edward," replied my mother timidly, "you are a far better judge of all questions than I pretend to be. Both you and Jane are. I only said—"

"You only said something weak and inconsiderate," he replied. "Try not to do it again, my dear Clara, and keep a watch upon yourself."

My mother's lips moved, as if she answered "Yes, my dear Edward," But she said nothing aloud.

"I was sorry, David, I remarked," said Mr. Murdstone, turning his head and his eyes stiffly towards me, "to observe that you are of a sullen disposition. This is not a character that I can suffer to develop itself beneath my eyes without an effort of improvement. You must endeavor, sir, to change it. We must endeavour to change it for you."

"I beg your pardon, sir," I faltered. "I have never meant to be sullen since I came back."

"Don't take refuge in a lie, sir!" he returned so fiercely that I saw my mother involuntarily put out her trembling hand as if to interpose between us. "You have withdrawn yourself in your sullenness to your own room when you ought to have been here. You know now, once for all, that I require you to be here, and not there. Further, that I require you to bring obedience here. You know me, David. I will have it done."

Miss Murdstone gave a hoarse chuckle.

"I will have a respectful, prompt, and ready bearing towards meself," he continued, "and towards Jane Murdstone, and towards your mother. I will not have this room shuned as if it were infected, at the pleasure of a child. Sit down."

He ordered me like a dog and I obeyed like a dog.

"One thing more," he said. "I observe that you have an attachment to low and common company. You are not to associate with servants. The kitchen will not improve you, in the many respects in which you need improvement. Of the woman who weakness respecting her which is not abets you, I say nothing—since you, Clara," addressing my mother in a lower voice, "from old associations and long established fancies, have a weakness which is not yet overcome."

"A most unaccountable delusion it is!" cried Miss Murdstone.

"I only say," he resumed, addressing me, "that I disapprove of your preferring such company as Mistress Peggotty, and that it is to be abandoned. Now, David, you understand me, and you know what will be the consequence if you fail to obey me to the letter.

I knew well—better perhaps than he thought, as far as my poor mother was concerned—and I obeyed him to the letter. I retreated to my own room no more; I took refuge with Peggotty no more; but sat wearily in the parlor day after day looking forward to night and bedtime.

What irksome constraint I underwent, sitting in the same attitude hours upon hours, afraid to move an arm or a leg lest Miss Murdstone should complain as she did on the least pretense of my restlessness, and afraid to move an eye lest she should light on some look of dislike or scrutiny that would find new cause for camplaint in mine! What intolerable dullness to sit listening to the tick of the clock; and watching Miss Murdstone's little shiny steel beads as she strung them; and wondering if she would ever be married, and if so, to what sort of unhappy man; and counting the divisions in the moulding on the chimney-piece; and wandering away, with my eyes, to the ceiling, among the curls and corkscrews in the paper on the wall.

What walks I took alone, down muddy lanes, in the bad winter weather, carrying that parlor, and Mr. and Miss Murdstone in it, everywhere; a monstrous load that I was obliged to bear, a daymare that there was no possibility of breaking in, a weight that brooded on my wits and blunted them!

What meals I had in silence and embarrassment, always feeling that there were a knife and fork too many, and those mine; a somebody too many, and that I!

What evenings, when the candles came, and I was expected to employ myself, but not daring to read an entertaining book, pored over some hard-headed harder-hearted treatise on arithmetic; when the tables of weight and measures set themselves to tunes as Rule Britannia, or Away with Melancholy; when they wouldn't stand still to be learnt, but would go threading my grandmother's needle through my unfortunate head, in at one ear and out at the other!

What yawns and dozes I lapsed into, in spite of all my care; what starts I came out of concealed sleep with; what answers I never got, to little observations that I rarely made what a blank space I seemed, which everybody overlooked, and yet was in everybody; what a heavy relief it was to hear Miss Murdstone hail the first stroke of nine at night, and order me to bed!

Thus the holidays lagged away, until the morning came when Miss Murdstone said: "Here's the last day off!" and gave me the closing cup of tea of the vacation.

I was not sorry to go. I had lapsed into a stupid state; but I was recovering a little and looking forward to Steerforth, albeit Mr. Creakle loomed behind him. Again Mr. Barkiss appeared at the gate, and again Miss Murdstone in her warning voice, said: "Clara!" when my mother bent over me to bid me farewell.

I kissed her, and my baby brother, and was very sorry then, but not sorry to go away, for the gulf between us was there, and the parting was there, every day. And it was not so much the embrace she gave me, that lives in my mind, though it was as fervent as could be, as what followed the embrace.

I was in the carrier's cart when I heard her calling to me. I looked out and she stood at the garden gate alone, holding her baby up in her arms for me to see. It was still cold weather; and not a hair of her head, nor a fold of her dress, was stirred, as she looked intently at me, holding up her child.

So I lost her. So I saw her afterwards, in my sleep at school—a silent presence near my bed—looking at me with the same intent face—holding up her baby in her arms.

CHAPTER IX.

I Have a Memorable Birthday.

I pass over all that happened at school, until the anniversary of my birthday came round in March. Except that Steerforth was more to be admired than ever, I remember nothing. He was going away at the end of the half-year, if not sooner, and was more spirited and independent than before in my eyes, and therefore more engaging than before; but beyond this I remember nothing. The great remembrance by which that time is marked in my mind, seems to have swallowed up all lesser recollections, and to exist alone.

It is even difficult for me to believe that there was a gap of full two months between my return to Salem House and the arrival of that birthday. I can only understand that the fact was so, because I know it must have been so; otherwise I should feel convinced that there was no interval, and that the one occasion trod upon the other's heels.

How well I recollect the kind of day it was! I smell the fog that hung about the place; I look along the dim perceptive of the schoolroom, with a sputtering candle here and there to light up the foggy morning, and the breath of the boys wreathing and smoking in the raw cold as they blow upon their fingers and tap their feet upon the floor.

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

THE BLESSING OF MOTHERHOOD

Healthy Mothers and Children Make Happy Homes

Motherhood is woman's highest sphere in life. It is the fruition of her dearest hopes and greatest desires; yet thousands of noble women through some derangement have been denied this blessing.

In many homes once childless there are now children because of the fact that Lydia E. Pinkham's Vegetable Compound makes women normal, healthy and strong. This is evidenced by the following letters which are genuine and truthful:

London, Ont.—"I wish to thank you for the benefit I received by taking your famous medicine, Lydia E. Pinkham's Vegetable Compound. Before my baby was born I was so ill I could not stand long or walk any distance. I had to lie down nearly all the time. After I took your medicine I felt like a new woman. I could work from morning till night and was happy and well. I certainly think it relieves pain at childbirth and recommend it to every woman who is pregnant. You may use this testimonial if you like. It may help some other woman."—Mrs. FRANK CORBIN, 132 Adelaide St., London, Ont.

Brooklyn, N.Y.—"I was ailing all the time and did not know what the matter was. I wanted a baby but my health would not permit it. I was nervous, my side ached and I was all run down. I heard that Lydia E. Pinkham's Vegetable Compound was good and took the medicine. I have now a beautiful baby and your Compound has helped me in every way."—Mrs. J. J. STEWART, 299 Humboldt St., Brooklyn, N.Y.

CHALLENGE COLLARS

Are a boon to every man who cares for his personal appearance.

Challenge Collars are not shiny rubber collars. They have a dull linen finish. In fact, you can't tell them from linen. Keep up appearances—keep down laundry bills.

The same enterprise, earnestness, ability and devotion to students' interests which have given this college its present standing, will be continued and every effort made to be worthy of the generous patronage enjoyed.

Next term will begin Thursday, January 2nd. Send for Catalogue.

THE ST. JOHN BUSINESS COLLEGE S. KERR Principal.

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information.

It was after breakfast, and we had been summoned in from the playground, when Mr. Sharpe entered and said:

"David Copperfield is to go into the parlor."

I expeced a hamper from Peggotty, and brightened at the order. Some of the boys about me put in their claim not to be forgotten in the distribution of the good things, as I got out of my seat with great alacrity.

"Don't hurry, David," said Mr. Sharp. "There's time enough, my boy, don't hurry."

I might have been surprised by the feeling tone in which he spoke, if I had given it a thought; but I gave it none until afterwards. I hurried away to the parlor; and there I found Mr. Creakle, sitting at his breakfast with the cane and a newspaper before him, and Mrs. Creakle with an opened letter in her hand. But no hamper.

"David Copperfield," said Mrs. Creakle, leading me to a sofa, and sitting down beside me. "I want to speak to you very particularly.I have something to tell you my child."

Mr. Creakle, at whom of course I looked, shook his head without looking at me, and stopped up a sigh with a very large piece of buttered toast.

"You are too young to know how the world changes every day,'- said Mrs. Creakle, "and how the people in it pass away. But we all have to learn it, David; some of us when we are young, some of us when we are old, some of us at all times of our lives."

I looked at her earnestly.

"When you came away from home at the end of the vacation," said Mrs. Creakle, after a pause, "were they all well?" After another pause, "Was your mamma well?"

I trembled without distinctly knowing why, and still looked at her earnestly, making no attempt to answer.

"Because," said she, "I grieve to tell you that I hear this morning that your mamma is very ill."

A mist rose between Mrs. Creakle and me, and her figure seemed to move in it for an instant. Then I felt the burning tears run down my face, and it was steady again.

"She is very dangerously ill," she added.

I knew all now.

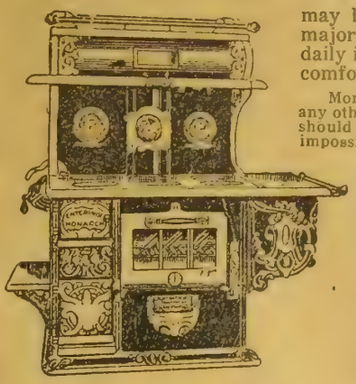
"She is dead."

There was no need to tell me so. I had already broken out into a desolate cry, and felt an orphan in the wide world.

She was very kind to me. She kept me there all day, and left me alone sometimes; and I cried, and wore myself to sleep, and awoke and cried again. When I could cry no more, I began to think; and then the oppression of my breast was heaviest, and my grief a dull pain that there was no ease for.

And yet my thoughts were idle; not intent on the calamity that weighed upon my heart, but idly loitering near it. I thought of our house shut up and hushed. I thought of the little baby, who, Mrs. Creakle said, had been pining away for some time, and who, they believed would die too. I thought of my father's grave in the churchyard, by our house, and of my mother lying there beneath the tree I knew so well. I stood upon a chair when I was left alone, and looked into the glass to see how red my eyes were, and how sorrowful my face. I considered, after some hours were gone, if my tears were really hard to flow now, as they seemed to be, in connection with my loss, it would affect me most to think of when I drew near home—for I was going home to the funeral. I am sensible of having felt that a dignity attached to me among the rest of the boys, and that I was important in my affliction.

A Get-Rich-Quick Scheme



may be all right in some cases, but the majority of us have to practise economy daily if we ever want to be rich, or even comfortably well off.

More money is wasted in the kitchen than in any other part of the home. That is where economy should be practised, but without a good Stove it is impossible. If you use an

ENTERPRISE MONARCH STEEL RANGE

you will save in food, fuel and repair bills, (not to speak of time and labour) enough to pay for the range itself in from one to two years.

Remember, even 2c saved on one meal is 6c a day or nearly $22.00 a year—and the MONARCH will save you that all right.

We are preparing a very attractive booklet explaining how this is done and illustrating some of the many good features of this celebrated range. Send your name in early and we will reserve a copy for you.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, **my home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure — **you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. I know that my home treatment is a safe and sure cure for **Leucorrhoea** or **Whitish discharges, Ulceration, Displacement** or **Falling** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths**, also **pains in the head; back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar** to our sex.

I want to send you a **complete 10 days' treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost**, my book—**"WOMAN'S OWN MEDICAL ADVISER"** with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers** of **Daughters,** I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all woman's diseases and makes women well, strong, plump and robust. **Just send me your address**, and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H. 309 - - - - WINDSOR, Ont.

If ever child were stricken with sincere grief, I was. But I remember that this importance was a kind of satisfaction to me, when I walked into the playground that afternoon, while the boys were in school. When I saw them glancing at me out of the windows, as they went up to their classes. I felt distinguished, and looked more melancholy, and walked slower. When school was over, and they came out and spoke to me, I felt it rather good in myself not to be proud to any of them, and to take exactly the same notice of them all, as before.

I was to go home next night; not by the mail, but by the heavy night-coach, which was called the Farmer, and was principally used by country-people travelling short, intermediate distances upon the road. We had no story telling that evening, and Traddles insisted on lending me his pil-

Any little girl can do the churning with
MAXWELL'S
Favorite Churn.
It makes the smoothest, richest, most delicious butter you ever tasted.

93

low. I don't know what good he thought it would do me, for I had one of my own; but it was all he had to lend, poor fellow, except a sheet of letter-paper full of skeletons; and that he gave me at parting, as a soother of my sorrows and a contribution to my peace of mind.

I left Salem House upon the morrow afternoon. I little thought then that I left it, never to return. We travelled very slowly all night, and did not get into Yarmouth before nine or ten o'clock in the morning. I looked out for Mr. Barkis, but he was not there; and instead of him a fat, short-winded, merry-looking, little old man in black, with rusty little bunches of ribbons at the knees of his breeches, black stockings, and a broad-brimmed hat, came puffing up to the coach window, and said:

"Master Copperfield?"

"Yes, sir."

"Will you come with me, young sir, if you please," he said, opening the door, and I shall have the pleasure of taking you home?"

I put my hand in his, wondering who he was, and we walked away to a shop in a narrow street, on which was written Omer, Draper, Tailor, Haberdasher, Funeral Furnisher, &c. It was a close and stifling little shop; full of beaver hats and bonnets. We went into a little back-parlor behind the shop, where we found three young women at work on a quantity of black materials, which were heaped upon the table, and little bits of cuttings of which were littered all over the floor. There was a good fire in the room, and a breathless smell of warm black crepe. I did not know what the smell was then, but I know now.

The three young women, who appeared to be very industrious and comfortable, raised their heads to look at me, and then went on with their work. Stitch,stitch, stitch. At the same time there came from a workshop across a little yard outside the window, a regular sound of hammering that kept a kind of tune: Rat-tat-tat, rat—tat-tat, rat—tat,tat, without any variation.

"Well," said my conductor to one of the three young women. "How do you get on, Minnie?"

"We shall be ready by the trying-on time," she replied gaily, without looking up. "Don't you be afraid, father."

Mr. Omer took off his broad-brimmed hat, and sat down and panted. He was so fat that he was obliged to pant some time before he could say:

"That's right."

"Father!" said Minnie, playfully. "What a porpoise you do grow!"

"Well, I don't know how it is, my dear," he replied, considering about it. I am rather so."

Style Pointers

Another vital point in designs is the bulging or thick neck collar applied to so many of the bodices and coats. This is an effect taken wholly from the dress of the east, which, as will be readily recalled, is finished at the neck with a straight, curveless piece which rolls or bulges at will across the back of ehe neck, there being no attempt at fitting. This is just what is being attempted in the fashionable neck finish of the day.

Sleeves, generally speaking, will be long—that is, the fashionable effect for general street wear is the long sleeve. Separate waists as well as costumes of the simpler character will have full length sleeves, but there also will be very many of the more dressygowns with long sleeves.

The kimono form has been retained to avery considerable extent, but it is the kimono set on the dropping or extended shoulder and brought down into fitted form.

There are a hundred variations of this style of sleeve, some of which are straight hanging, others flaring and open, and still others in the bell shape. Designers will be allowed much leeway in sleeves, and it looks very much as if there would be a strong representation of fancy styles.

To describe in detail the various forms would be difficult, but a glance at the forms shown in the garments imported for illustrating this spring's fashions affords conclusive evidence of the sleeve variation that will be found in forthcoming fashions.

The Paris market shows considerable variation in suit coat lengths. Several of the important houses, notably Paquin and Cherult, are emphasizing the long jacket.

Most significant, however, is the fact that Callot, who, as everybody knows, is a great leader, shows many very short coats of the bolero or short blouse style. Thus it is evident that Paris makers have no intention of confining themselves specifically to one length.

However, for the general line of merchandise the recommendations that have been made by the leading factors in the American garment trade are absolutely correct.

Meats and their Cooking

The quick application of a high degree of heat sears over the cut surfaces of the meat pores and prevents the loss of juices. Therefore:

Meats roasted should be popped in a hot oven.

Meats broiled should be held at first as close as is safe to a hot bed of coals.

Meats boiled should be plunged into boiling water.

Contrariwise, to extract the juices, as for soups, meat must be placed in cold water and gradually brought to a boil.

Meats should boil gently, if they are to be tender or of even flavor.

The addition of a couple of tablespoonfuls of vinegar in the pot will go far to make tender a tough piece of meat boiled.

A large ham requires at least four hours' boiling; a small one, two hours.

Meats fried or broiled, (or even roasted) are better for searing over before salting.

Sticking a fork in meat already seared over permits the escape of the juices.

Meats should be fried always in butter; never in lard.

All fillets (tenderloins) should be cut across the grain, set on end (cut fibers setting on the block), and smashed with the flat of the cleaver. Otherwise they will be leathery.

Roast Beef

(Releve or Roast.)

Place the meat (loin or foreribs of beef) in roasting pan; sprinkle with salt; add a cup of water and roast in hot oven, allowing 15 minutes to the pound. Baste frequently. When well cooked, roast will be firm when pressed with the finger.

After removing roast from pan, add 1 cup stock or water; boil, while stirring, for a minute or two; skim off floating grease and pass the gravy through a strainer. This gravy is considered best to serve with roast beef.

Roast beef, when served as a releve, should be accompanied by a vegetable as a garnish, preferably potatoes fried in butter, stuffed tomatoes, or others similarily cooked. If served as a roast, it should be accompanied by a salad.

Braised Tenderloin

(Releve.)

Lard the tenderloin with bacon strips quarter inch thick; place in roasting pan and sprinkle with salt; add, in pan, 2 onions and 1 carrot, sliced, 2 cupfuls stock, and 1 cupful Madeira; baste frequently, allowing 15 minutes to the pound. Make gravy same as for roast beef; serve with Jardiniere Garnish.

Beef Saute

(Entree.)

Slice tenderloin or other steak in pieces the sizes of a half-dollar, but twice as thick; brown 1 chopped onion in butter; and sliced meat and fry for about 5 minutes; sprinkle with a little flour and add a cupful of cream.

Broiled Steak

(Entree.)

Have steaks cut 1 inch thick, and divide into individual portions before cooking. Broil on bright fire five minutes; put them on warm dish, and place on each one teaspoonful butter mixed with chopped parsley.

The Daughter in the Home

The profession of daughter is the highest, the happiest, the noblest that a young woman can follow, until she exchanges it for that of wife and mother, for which it is the best of all preparations.

This is the time to which your parents have been looking forward during the years of training while giving you every advantage that they could afford. You say, perhaps, "Mother will not let me help her. She prefers to keep house herself." That is because she fears that you may be thoughtless, careless or extravagant. Show her that she may be depend upon you by doing thoroughly and well whatever you are entrusted with, and and she will be glad to yield to you little by little the guidance and direction of the household with fond pride. A fresh mind brought to bear on housekeeping problems may find most attractive and novel solutions.

One sin against etiquette and the principles upon which good manners are based is the freedom with which the young persons of the family find fault.

It is fair to suppose in this country that by the time the children are grown the parents have reached the point of greatest financial prosperity. The children, therefore, have the benefit of the best that their parents have known. The elders are naturally disappointed and sometimes resentful when the children carp and critize, as though the family table and mode of living were not up to their standard —they who have supplied all being judged by those who have done nothing.

Democratic notions of equality have penetrated into homes, but it is a distinct loss to the young folk who have forgotten the habit of looking up to their parents as to superior beings, to be loved, trusted and obeyed. This attitude is the best rehersal for one's reverent relation to God.

We acknowledge it as a courteous obligation to express thanks for any service done for us. Your father lays down his life for you and the other dear ones day by day, year after year. His inspiration to unwearied perseverance has largely been his desire for your advantage. Thank him by loving, daughterly attentions. Humor his "little ways". If unpunctuality, or the use of slang, or any special thing irritate him, regard it is an obligation to avoid it. Make his home-coming a pleasure and his evenings a reward for laborious days, as far as in you lies.

In your intercourse with your brothers and sisters respect a closed door. Never ask questions that you think may be unwillingly answered. Avoid stock subjects of disputation.

Be punctilious in prefacing every request with "please," and acknowledging every trifling service with "thank you." Laugh with, but never at, others. Be quick to apologize if you have hurt any one's feelings, and never let the sun set without "making up" if there has been any disagreement. People are usually sensitive about their clothes; be therefore tactful in critism. Regard quarreling as the height of vulgarity. Do not betray to outsiders anything whatever that can in any way reflect at all upon the members of your family.

If with servants you are courteous as well as kind you will secure their loyal devotion. They like to serve a "real lady."

In short, be a well-bred gentlewoman at home as well as abroad.

Roast Tenderloin

(Roast.)

As for roast beef, but roast not quite so long in proportion to weight.

Recipes for Serving Pears and Grapes

PEAR MARMALADE—Pare, core and quarter ripe, juicy pears. To six pounds of fruit allow one pint of water. Cook slowly until reduced to a pulp. Add three quarters of a pound of sugar to each pound of fruit, and cook, stirring frequently, until the mixture becomes very thick. If desired to vary flavor, some lemon or orange rind may be steeped in the water before adding it to the pears. Can while hot.

PEAR CHARLOTTE—Pare and core twelve pears, put them in a saucepan with one tablespoonful of butter, and cook slowly until very tender. Butter a charlotte-dish m,ld and line with slices of buttered bread. Spread in a layer of pears, then a layer of bread, and so on until it is filled. Bake three quarters of an hour in a hot oven, and serve with liquid apricot sauce.

BAKED PEARS—Halve them, and cut off ends. Pack in earthen jar, half fill with molasses, then add water sufficient to cover fruit. Bake in a very moderate oven until pears are very tender. To vary flavor omit a small part of molasses, and add some sugar and a few whole cloves or some strips of lemon-peel. After cooking is finished, they may be placed over the fire, heated to boiling point and canned.

PEAR FLAVOR FOR ICE-CREAM AND ICES—Pare, quarter and core the pears, and cut in slices. Put into a preserving kettle, add enough water to keep from sticking, and cook until soft. Rub through a sieve, and measure. To each pint add one quarter of a pound of sugar, and stir until dissolved. Fill jars to overflowing with pulp, and seal them. Set the jars in a steamer, and steam for one hour and a half, then let them remain in the steamer until cold. Wipe and care for them as you would preserves.

GRAPE JELLY—Prepare the grapes as for grape juice. After draining, return the juice to the kettle, and place uncovered over the fire. Boil thirty minutes, then measure and allow one pint of sugar to one pint of juice. Boil twenty minutes longer, removing scum as it rises. Pour into hot tumblers, and set at once in the sun. If it should not be as firm as you wish by the next day, let it remain in the sun until of right consistency. When cold, cover with paraffin.

Grape Salad—Line a glass dish suitable for salad with crisp lettuce-leaves, then spread thick with halved and stoned grapes, any kind preferred, although the larger the better. When ready to serve, heap whipped cream on the salad, and drop chopped walnuts on top. This salad can be prepared in the winter from canned grapes.

Don't be content with skim milk profits from your livestock; get the best of it, all that is due you. Just put your horses, cattle, sheep and hogs **in condition** to do more work, produce more milk, make greater gains in flesh. That is the secret of success. This is easy! Just use

Cruelties in the Poultry Yard.

It is surprising how many people, otherwise model citizens, are guilty of cruelty to both fowls and animals. It may not altogether be intentional on their part, but nevertheless they do things that call for censure.

One of the most common acts is to carry chickens by their legs, heads down. This cruelty has been practiced for years, and no one ever thought anything about it. They did not notice the rush of blood to the head of the fowl when carried that way. A neighbor just the other day was carrying a fat hen by the legs, and in a few minutes the bird was gasping and came pretty near choking to death. An equally cruel method is to carry fowls by the wings—especially so when the fowls are heavy bodied. The proper way is to allow the fowl to rest on the arm, and the legs held firmly by the hand; or it can be held between the arm and the body.

A dealer was one day noticed to yank killing stock out of a crate, by catching by a leg or a wing, and otherwise roughly handling them. When remonstrated with he replied that it did not matter as the birds would soon be killed.

With some people it is common to throw fowls over the fence into a yard. There is no telling in what manner they will reach the ground, and when this cruelty is performed while the attendant is in a fit of anger, there is considerable force put into the throw.

A very pious old gentleman was vexed to the cussing point because his chickens happened to get out of the yard, through a broken fence, in to his garden. In his anger he threw a stone and lamed one of the fowls. "There, it serves you right, I don't pity you a bit," was the only comment on the accident. How much better it would have been to have carefully driven these fowls back into the yard and at once repaired the fence.

Verily the contrariness of the hen is "not in it" with the contrariness and stupidity of some of the attendants.

A common cruelty is to overcrowd the flocks, especially in close, badly ventilated houses. Allowing the supply of drinking water to run out, and placing the drinking vessels out in the sun, are cruelties practiced by shiftless, lazy people.

Many acts of cruelty can be named in the methods employed in breaking up broodiness in hens. For instance, dousing them in water, tying them by one leg to a stake or throwing them into a yard of young cockerels to be knocked about right and left, are all practices that should be stopped. Broodiness is a provision of nature for rest, and certainly the industrious hen deserves it. But if it is wanted to have her change her ideas and condition, the only humane way is to place all such in a separate house where there are no nests nor male birds, and allow them to gradually have the fever pass off.

For some years back it was the custom to sell little (newly hatched) chicks at the poultry shows, and also at large bird stores around Easter. These innocents were bought by fond parents for their little tots, and carried to their houses in pasteboard boxes. Without the proper brooder heat, or the right kind of food, these little chicks would be slowly tormented to death, quite often, too, by the rough handling from the "cute baby" But it is not so now. The society for the Prevention of Cruelty to Animals has taken hold of the matter and will no longer allow this uncivilized cruelty.

Anything that will inflict needless pain, should be punishable. It is surprising how many people, who other-

wise are kindhearted and good, will not stop to think that their very acts are uncharitable and un-Christianlike. —M. K. B.

Large or Small Seed Pieces.

We had such a clear-cut experience in regard to planting small potatoes and cutting the large tubers into small pieces which had only one or two eyes that I believe it may be of benefit to some farmer readers to know how we came out.

Our potatoes had been sorted over and the very small ones were from one to 1½ inches in diameter. Cutting the seed fell to me, and when the piece was two-thirds planted word came that the potatoes would not cover the desired acreage unless cut finer. This was done, and some of the pieces were decidedly small—there were four rows of these. Finally it was necessary to use the small whole potatoes to finish out the last four rows.

The potato field was located so the ends of all rows were towards the house, giving us a good opportunity to observe the growth of the plants. The season was rather dry. The first plants to appear came from the largest seed pieces. When those from the last eight began to show many hills were missing, the plants did not grow as fast, and seem to feel the drougth more.

When harvested the yield of potatoes from these eight rows was decidedly less, also the tubers were smaller and fewer in the hills than in any other part of the field.

Those eight rows were noticeable from the house from the time the plants broke ground until after they were ripe. The seed pieces were too small to give the plants a good start. There was not substance or moisture enough to keep them going until the roots can take hold of the soil and strike out for themselves, and even when the root system was established it was small, weak, and never built up a strong plant as did the ones from the larger seed.

I would not cut a medium sized potato more than three or four times. Two good eyes are better than more, but I want a fair-sized piece of potato, even if there is but one eye.

It does not pay to use small potatoes for seed or to cut your seed too fine. You will raise just as many potatoes, if not more, to plant a smaller piece of ground and cut your seed the proper size.—D. M. G., Kennebec Co., Me. in Field and Farm.

Additional Facts in Regard to Tuberculosis.

How long and under what conditions the tuber bacilli live outside the body are questions of grave importance both to the farmer and to the keeper of his home. Unless the housewife is constantly on the alert she may administer contagion or even death at her table. How?

Dr. Charles F. Briscoe, in Bulletin No. 161 just published by the University of Illinois Agricultural Experiment Station relates that out of 1233 samples of butter offered for sale, 163 were contaminated by tubercle bacilli; in 7397 samples of market milk examined, tubercle bacilli were present in 502. This offers a dangerous source of contagion, especially for children.

The experiments showed that tubercle bacilli lived for ten months in butter in cold storage. They live in the tissues of a dead guinea pig exposed in the water, for more than 321 days. In sputum in running water, they live for more than 282 days. The tubercle bacilli, not in sputum, live for 441 days.

Tubercular animals alive or dead are a menace. They should, in the cause of common safety, be killed and their carcasses burned.

Human and bokine tubercle bacilli live for practically the same time and much longer than has been generally supposed.

The ultra violet rays of the sun deal sure death to the tuber bacilli. They cannot bear the light, for their deeds are evil. "Sunny up" the cow-sheds and the barns. Direct sunlight has a "toning up" effect that is more than imagination.

Turning Young Calves on Grass.

When you turn out your cattle in the spring make a little exception to the young calves. Those that are robust, and six, eight or ten months old, may be put out when the grass is good, but those under six months, especially if weak, will need feed and care in addition to the grass.

I know of some strong Shorthorn calves that were put on pasture May 15, when only about six months old, and they improved. Others, two or three months old, are less capable, and even at four or five months there is no advantage in making them find all their own feed in the fields.

Very young calves cannot be expected to do well on grass. Put them out more for air and exercise than for economy in feeding. Early in May is a good time to turn out as many as are fit. The grass is usually abundant and of good quality, and the fresh air and sunshine are acceptable to the young animals. Calves making little or no progress in the sheds will improve wonderfully when put on grass with good care.

To feed calves up to the time of putting them out and suddenly stop and rely on grass often interferes with their growth. Continue feeding to some extent after turning on grass withdrawing it gradually, and no check will then be experienced.

The youngest calves should never be turned out with the milch cows, as they are likely to suck. Neither is it wise to put the very small ones in with the large grazing stock, but give them a paddock, orchard, or little sunny, sheltered field, and they will enjoy its comforts. They may be left out night and day, but they should be given a little feed twice a day as long as necessary. A little feed morning and evening will suit them better than one big meal a day. They will not relish chaff or fodder, but will make good use of milk or meal.—W. H. Underwood.

It would surprise you to know of the great good that is being done by Chamberlain's Tablets. Darius Downey, of Newburg Junction, N. B., writes, "My wife has been using Chamberlain's Tablets and finds them very effectual and doing her lots of good." If you have any trouble with your stomach or bowels give them a trial. For sale by all dealers.

KA-LOR-OID
TRADE MARK REGISTERED
(Colored RU-BER-OID, Canadian Patents Nos. 93,027 and 93,160)

KA-LOR-OID, in its beautiful, soft shades of Red and Green, is the **only** prepared roofing made in permanent colors. In KA-LOR-OID Roofing the colors are not painted on, but by our patented process are made an integral part of the exposed surface. They last as long as the roofing itself—and that means longer than any other prepared roofing has lasted, for KA-LOR-OID is made of the same materials, and has the same wonderful durability as RU-BER-OID Roofing in the regular Slate color.

Commercial Fertilizer.

(Continued from page 567)

tions used and the difference in the character of the material.

That is to make a high grade fertilizer, on one that has in it the material to make a crop grow from start to finish, an abundance of high grade material must be used. And make a low grade fertilizer, which often sells at a high price, and does not contain but a very small amount of either high or low grade material but to fill up the bags a make-weight or filler is used.

The sources from which manufacturers get material is as follows:

Organic Nitrogen exists in animal and vegetable matter. The most valuable sources are dried blood, dried meat, tankage, dried fish, refuse from fish factories, cotton seed meal, etc. These materials are all rich in Nitrogen and decay rapidly and consequently give up their Nitrogen when conditions are favorable. Other materials less desirable as sources of Nitrogen are leather meal, wool waste felt waste, hair, horns and hoofs. Inorganic Nitrogen is obtained from Sulphate of Ammonia, Chloride of Ammonia. Ammonia Nitrogen is derived almost exclusively from Sulphate of Ammonia, one of the most concentrated materials which furnishes Nitrogen for fertilizers. It averages 2 p. c. of Nitrogen. This form of Nitrogen is readily converted in the soil into nitrates and is therefore available as a food supply for plants.

Nitrate of Soda and Nitrate of Potash are extremely soluble and the Nitrogen in them is directly and immediately available no further change being necessary. Nitrate of Soda contains 16 per cent Nitrogen. It is completely soluble in water, diffuses readily through the soil and forms no insoluable compounds with other substances.

The next material, Phosphoric Acid, is derived from materials called Phosphates. Phosphate of Lime is the form most largely used. The materials used by the manufacturers are Phosphate Rock of South Carolina and Florida. This material is acted on by Sulphuric Acid which changes the insoluble Phosphoric Acid in the rock into a soluble form and is known as Acid Phosphate. Ground bone is another source of Phosphoric Acid. It also contains from 2 to 4 per cent. Nitrogen. Basic Slag is a waste product of the steel works. Lime is introduced into the furnaces and tne Phosphoric Acid in the iron ore combines with it, and is drawn off as slag. This slag is very finely ground and contains from 12 to 14 per cent. of Phosphoric Acid, also some free lime, which in many instances corrects the acidity of the soil and is therefore valuable.

Slag should not be mixed with a fertilizer containg nitrogen, as the lime sets free the Ammonia and a loss of Nitrogen takes place. Potash exists in a number of forms as Muriate or Sulphate. All forms used in the fertilizer industry are freely soluable in water. The form of the potash influences the quality of the crops Potatoes for instance, are favorably influenced by the Sulphate. Miriate is the form most used in the orchards of the Valley.

The chief sources of Potash Salts are the mines of North Germany. Kainit and Sylvinit are crude products and contain a number of impurities. The principal impurity in Muriate is common salt. Both Muriate and Sulphate of Potash contain about 50 per cent of actual potash. As a rule, in the past, the farmer has been buying his fertilizers on the ton basis without sufficient regard to the amount or form of the constituents contained in them.

The direct value of a mixed fertilizer is determined by the amount of

3

Concrete is the cheapest building material

WHETHER for a silo, a milk-house, or a million bushel grain elevator, concrete is the most economical building material in use to-day.

Concrete never requires repairs, and the saving in repair-expense alone makes the greater economy of using concrete more apparent every day.

The cost of other building materials is constantly increasing.

The cost of concrete is being reduced.

Canada Cement

which Canadian farmers use, with their own sand, stone and gravel to make concrete, is the only ingredient you have to buy.

We have, by reason of our large output and scientific methods, been able to bring the price of "Canada" Cement so low that it is within the reach of everyone.

An increase in demand results in a greater economy of production, and when conditions have warranted it, we have, from time to time, shared this saving with the consumer by reducing the price of Canada Cement. This demand will continue to increase—as fast as farmers learn of concrete's superiority over other materials.

When you buy cement, see that you get "Canada" Cement; by so doing you will assure the complete success of all your concrete work.

Send a post card for our book "What the Farmer Can do With Concrete." It is free.

There is a Canada Cement dealer in your neighborhood.

If this label is not on every bag it is not Canada Cement.

Canada Cement Company Limited - Montreal

available plant food it contains; hence the buying of one or more of the constituents, Nitrogen, Potash and Phosphoric Acid. The more concentrated the material the less will be the proportionate expense of handling the constituent desired.

The following are illustrations of the methods by which different brands may be made. The difference in the quantity of actual fertilizing constituents used, which causes the variation in ton prices:

FORMULA I.

Nitrate of Soda 16 p. c. N, 500 lbs., having 80 lbs. N. or 4 p. c.
Acid Phosphate 16 p. c. Phos. 1100 lbs. having 180 lbs. Phos or 9 p.c.
Muriate Potash 50 p. c. P. 400 lbs., having 200 lbs. P. or 10 p. c.
Total, 2000 lbs.; 460 lbs. plant food.

FORMULA II.

Nitrate Soda 16 p. c. N, 250 lbs. having 40 lbs. N or 2 p. c.
AcidPhos. 16 p. c. 1000 lbs., having 160 lbs. Phos. or 8 p. c.
Muriate 50 p. c. P., 80 lbs. having 40 lbs. P. or 2 p. c.
Make Weight 670 lbs.
Total 2000 lbs.; 240 lbs. plant food.

Formula No. 1 shows a high grade product both as to quality of plant food and concentartions.

Formula No. 2 is only high grade in quality, and requires a make weight of 670 lbs. of worthless material in order to get the ton.

It will be observed that Formula No. 1 contains nearly twice as much plant food as No. 2, or in other words it will require the purchase of about 2 tons of fertilizer made from Formula No. 2 to secure the same amount of plant food as is contained in one ton of No. 1. Now the material in No. 2 other than the actual plant food possesses no fertilizing value, but the actual cost of the constituents is considerably increased because of the expense of handling, bagging, shipping and selling are just double what they would be for No. 1.

The manufacturers are in the business to cater to the demands of the trade. If consumers are intelligent, and have taken the trouble to look into the business; high grade, rather than low grades will be used. High grade mixtures cannot be made from low grade products.

Scarcely a farmer in the Annapolis Valley uses mixed fertilizers on their orchards. The articles used are Nitrate of Soda, Muriate and Sulphate of Potash, Bone Meal, Acid Phosphate and Basic Slag. These ingredients are not as a rule mixed before applying to the land, but are served in various proportions separately. A very good dressing for an acre of bearing orchard planted twenty-five years would be, 150 lbs. of Nitrate of Soda, 500 pounds of Acid Phosphate, and 150 lbs. of Muriate of Potash. These ingredients may be varied according to the character and condition of the soil and the general state of the trees. I have used 1500 lbs. of a fertilizer made from Formula No. 1 on potatoes with excellent results.

I am prosecuting farm operations with a view of improving the fertility of the land, growing good crops and making and saving money. If I went to a fertilizer vendor and bought mixed goods I would expect to pay $7.00 per ton extra, for the cost of mixing, handling, etc., over the cost of the ingredients. If I did buy a mixed fertilizer I would study the analysis on the bags, having in mind that the percentage of the ingredients determined the value of the fertilizer. I have never been offered a mixed fertilizer for less than $30.00 per ton. I have before me the guaranteed analysis of a certain manufacturer which reads as follows:

(Continued on page 591)

Finish This Story

A WORKMAN in an I H C wagon factory was explaining the various stages of wagon construction to an interested visitor. He picked up two pieces of long leaf yellow pine, which to all appearances were sawed from the same board, and asked the visitor to notice the difference in the weight of the two pieces. The lighter piece, he explained, was kiln-dried. The heavier piece was air-dried and more thoroughly seasoned. It had retained the resinous sap which adds strength and toughness, while in the kiln-dried piece of lumber this sap had been drawn out by the too rapid application of heat.

Every Stick of Lumber Used in IHC Wagons is Carefully Selected, Air-Dried Stock

Here was something to think about. The visitor asked for a test as to the relative strength of the two pieces of wood. The air-dried piece held up under nearly double the weight under which the kiln-dried piece of lumber broke. The workman explained how the comparative life of air-dried and kiln-dried lumber has about as great a difference.

To the eye there was no difference between these two pieces of lumber, but when put to the test there was a vast difference. So it is throughout the construction of I H C wagons—**Petrolia,** and **Chatham.** They are built for real strength, light draft, and satisfactory service.

After seeing the care used in the construction of every part of an I H C wagon, the visitor asked: "Why don't you let people know of the great care used in selecting material and in constructing I H C wagons?"

This is what we have been trying to do, but we cannot tell it all in one short advertisement. I H C local agents handle the wagons best suited to your work. See them for literature and full information, or write the nearest branch house.

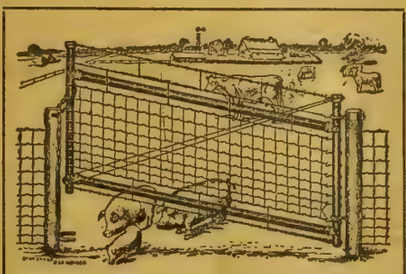
Ending Your Gate Troubles



This Gate is made of tubular steel of large diameter—far superior to gas pipe or tee or angle iron, and of heavy wire mesh fabric. Will last a lifetime. Can be raised as shown, by simple adjustment. Clay Gates are wonderfully light and strong, and always swing true.

ISN'T THE KIND OF GATE ALL GOOD FARMERS WANT AS FOLLOWS:—a Gate (1) that won't sag, break, bend, burn, blow down or rot; (2) that can be raised (as shown) to let small stock through, yet keep back large stock; (3) that will raise to lift over snow in winter; (4) that will positively keep back breachy cattle; (5) that will last a life time; (6) that is guaranteed.

Clay Steel Farm Gates

meet all the above requirements. This is why the leading stockmen, with scarcely an exception, have Clay Gates on their farms. This is why farmers who once try them, keep them, being delighted with them. The O. A. C. has them; so have the Experimental Farm at Ottawa, and the Macdonald College Farm. 30,000 Clay Gates were sold in 1912. They cost a little more than other Gates, they are worth much more.

60 Days Free Trial

One or a dozen Clay Gates will be sent, freight paid, to any farmer willing to try them. Keep them 60 days without expense or obligation. Send size of opening when writing. Send today for illustrated price list.

I GUARANTEE every Clay Gate to be free from defects in material or workmanship. I will replace free any parts, or the entire gate, giving out for such reasons.
H. RALPH STEELE, Manager.

Essential Things That are Sometimes Overlooked in Grooming Farm Animals.

(Continued from page 577)

clean straw wiping up the material loosened up by the curry-comb. The work of the wisp is facilitated by the spreading of a thin coat of damp sawdust over the horse before rubbing.

A thorough brushing is one of the most important steps in the care of a horse. The brush should not be too stiff and is best with a curry-comb. The purpose of the brush is to clean out the hair and work up the skin into a soft pliable condition. In this way the pores of the skin are opened up and the secretion of the oils that produce a gloomy coat is stimulated.

The rag used for the rub-down should be of cotton cloth, and should be clean. The rub rag simply lays the hair and brings out the gloss. It has best results when slightly dampened.

CARING FOR THE FEET, MANE AND TAIL.

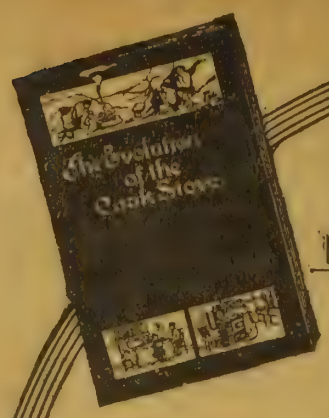
The last process, the care of the feet, mane and tail, is probably more often neglected than any other step. Besides the usual daily brushing of the mane and tail, we should at frequent intervals wash them. Washing with warm water and castile soap, rinsing with cold water, and then rubbing till almost dry gives good results. Washing not only cleanses the tail thoroughly but induces a great growth of hair. The care of the hoof embraces cleaning out of the sole with a hoof hook, washing out the sole and the outside of the hoof with water and sponge and wiping them quite dry with a rag. Many times this process is the means of discovering nails picked up, or stone bruises and if carefully followed we will have little trouble with hoof diseases. It is quite essential that the hoof be wiped dry after each wasning for if it is left to dry alone the hoof soon becomes brittle and liable to cracks. The use of hoof preparations is seldom profitable. A very light application of vaseline is all that is ever necessary for a healthy hoof.

When to groom the horse is a question that each man will have to answer for himself. With a hard working farm horse it is always best to care for them twice a day. That is a currying and brushing in the morning before work; and a brushing and cleaning out of the hoofs at night. With many farmers it is hard to find the time for such attention after work hours. This, however, is the time that most animals most need care. Coming in from a hard day's labor, covered with dust and sweat, the evening meal and the night's rest are no more refreshing to the horse than they would be to you or me under the same circumstances. These little attentions only take 20 or 30 minutes a day and your horse will pay you back many times in increased efficiency, value and looks.

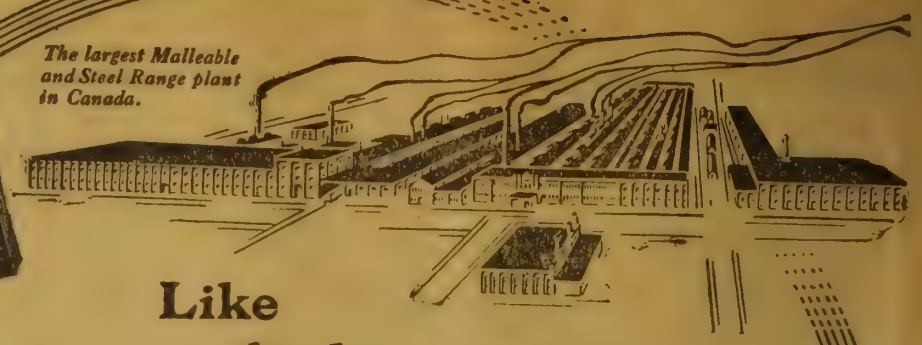
Milk Fever Now and Then.

Professor P. M. McConnell answers in the London, (Eng.) Dairy World an inquiry as to the former and present status of that once dreaded disease, milk fever, he says:

There is not so much milk fever about in the country now as there used to be some years ago. We know a great deal better how to feed milk cows now, and we take care never to have them in a plethoric state when they come onwards to the calving time. Under the old regime it was the custom to physic the cow tremendously before she came to the work, and if she took this disease afterwards— well, more physic was poured into her by the bucketful, with the usual or general result that the animal died all the same. The tackling of this disease must have prevented a lot of work. The writer has sat up many a night with a cow infected with this disease trying to get her to come round and to get her on her feet as it were. Now the disease gives us no trouble whatever, because, apart from the fact that we do to a large extent prevent it, if an animal does take it after parturition, we can almost cure it in a few hours. The trouble is believed to be due to the presence of either a microbe or an enzyme in the udder, and these are of the anaerobic type—that is, they will not live in the presence of fresh air. The first kind of treatment attempted was to inject a solution of iodide of potassium or chinosol into each teat. This generally cured the milk fever but very often ruined the udder of the cow, as she was of little use as a milker ever after. Nowadays we inject simply common air into the teat, although this has to be done with a special injector which passes the air through cotton-wool to purify it. The writer, however, knows of a case where a cow was saved by the use of a bicycle pump by which a quantity



Cash or Credit



The largest Malleable and Steel Range plant in Canada.

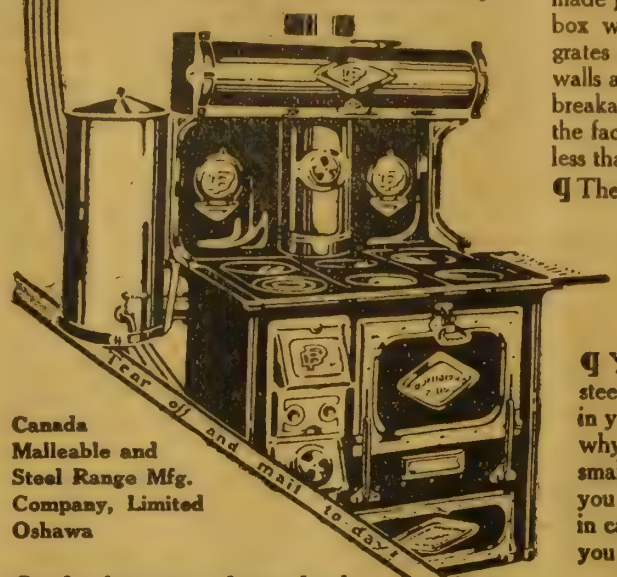
Like finding money

Let us show you the range in our booklet. Every part is described clearly so that you can see just what you are getting. In addition the book tells an interesting story of cooking that you will enjoy reading. Send for a copy to-day.

GETTING a Dominion Pride Range at the factory price puts about $20 in your purse. That's a clear saving to you.

¶ It's hard to compare prices because no other range is made just like the Dominion Pride. For instance, our fire-box weighs over 100 lbs., and with ordinary care the grates and fire-box linings will last a lifetime. The steel walls are three-ply—the tops and doors are made of unbreakable malleable iron. ¶ Even so, buying this range from the factory will land it at your station, freight paid, for 30% less than the next best range you could buy.

¶ The Dominion Pride range is unconditionally guaranteed.



Dominion Pride Range

54

¶ You would like to have a beautiful steel range like the Dominion Pride in your kitchen, and there is no reason why you should not have one. A small cash payment will secure it and you can pay the balance either in cash or on easy terms, as you choose.

The Bissell Out-Throw Disk Harrow

To settle all doubt about which is the BEST OUT-THROW DISK HARROW, we ask you to test the "Bissell" Out-Throw in a field competition with other Out-Throw Harrows.

The "Bissell" Out-Throw has many features that have made the name "Bissell' famous in connection with Disk Harrows. It has plates of the correct shape. One gang is set slightly ahead of the other. The gangs cannot crowd or bump together and cause the Harrow to rock when you come to hard soil—a new feature in Out-Throw Harrows. The hitch is well back, the draught is light and there is no neck weight.

The machine in actual use is our best advertisement. No need to send special travellers to sell the "Bissell." We put our name on every Harrow. If you would like to learn more about Disk Harrows, send to Dept. M for free booklet of both out-throw and in-throw styles. 72

T. E. BISSELL CO. LTD., ELORA, ONT.

of air was forced into each teat. There is sufficient oxygen in the ordinary atmosphere to prevent the evil action of the microbe or enzyme which causes the trouble, and if the animal is taken in time she is usually up in a few hours. It is necessary to beware of complications, as very often this disease is followed by pneumonia, and therefore the animal must be kept comfortable until she is really past all danger. There must have been a tremendous lot of money lost by this disease before the cure was found, and it is certainly a great advance in being able to tackle it.

Clean Cream.

(1) In favorable weather keep the cows in the pasture as much as possible, thus preventing an accumulation of manure in the stable or corral.

(2) Remove the dirt from the cows' udders and flanks before milking and wipe the udders with a damp cloth.

(3) Do not feed hay or dust feed just before milking.

(4) To clean pails and cans, first wash them clean with warm water and a mineral washing powder, then rinse them well, scald them, and allow them to drain.

(5) Skim about a 30 per cent cream.

(6) Take the separator apart and wash it thoroughly after each separation.

(7) Remove the cream to a milk house or cool place wnere the air is pure and where the can may be placed in a trough or barrel of cold water fresh from the well.

(8) Do not mix warm cream with cold cream, nor keep cream in cellars or caves.

(9) See that all cans and tinware coming in contact with cream are perfectly sweet and clean, especially in the seams and crevices.

(10) Deliver the cream in the morning during hot weather. Make at least three deliveries a week in summer and two in the winter.

(11) At all times protect the can containing cream against heat, cold and dust by covering the can completely with a clean canvas.—(Complied from Kansas Experiment Station Circular 24.)

Planting Hints.

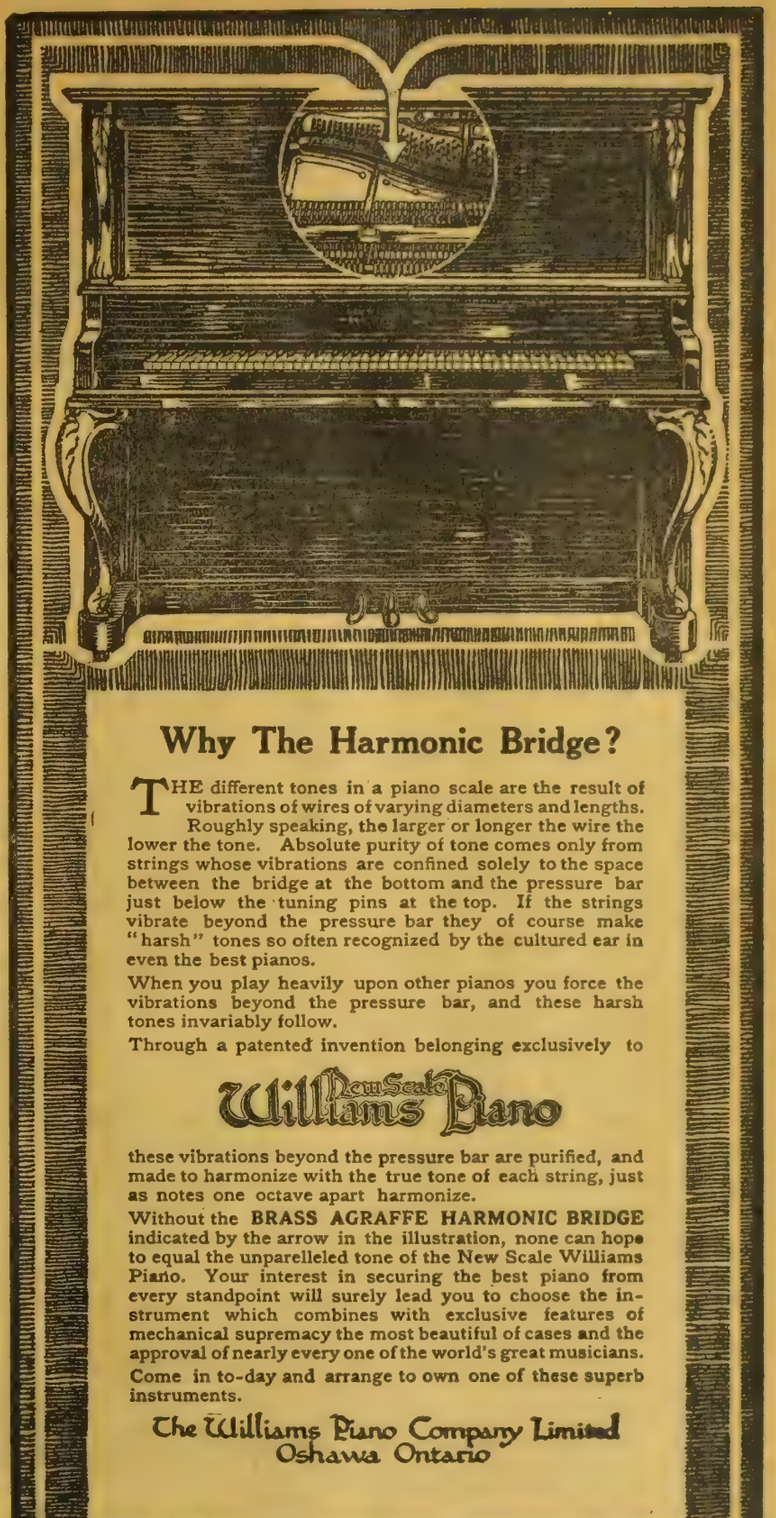
The average farmer doesn't seem to realize the importance and advantage always gained by making a thoroughly prepared seed bed before planting and careful seed selection. Do not try to prepare the soil or get it in condition for planting when it is not in proper shape.

If too wet when stirred, after it is dried out it will be a mass of fine clods, no matter how much dragging or harrowing we may give it. The roots of the plants cannot penetrate these lumps and they are a nuisance and bother in cultivating the crop.

With a thoroughly pulverized seed bed we get a better stand and the crops thrive and grow off more rapidly.

Never be in too big a hurry to plant before the weather gets warm and suitable for this work. Better delay the planting two weeks or more rather than plant before you have got the land in proper condition, or before the ground becomes warm.

The only safe way to tell whether or not you are making a profit on your farm is to begin a system of farm accounts. If you are to be fair with your farm you will keep accounts with it, charging it with the labor, seed and equipment and giving it credit for everything it produces. Incidently it may be worth much to you to have a record of your transactions, for it may show that you have not been giuing your farm a square deal.



Why The Harmonic Bridge?

THE different tones in a piano scale are the result of vibrations of wires of varying diameters and lengths. Roughly speaking, the larger or longer the wire the lower the tone. Absolute purity of tone comes only from strings whose vibrations are confined solely to the space between the bridge at the bottom and the pressure bar just below the tuning pins at the top. If the strings vibrate beyond the pressure bar they of course make "harsh" tones so often recognized by the cultured ear in even the best pianos.

When you play heavily upon other pianos you force the vibrations beyond the pressure bar, and these harsh tones invariably follow.

Through a patented invention belonging exclusively to

New Scale Williams Piano

these vibrations beyond the pressure bar are purified, and made to harmonize with the true tone of each string, just as notes one octave apart harmonize.

Without the **BRASS AGRAFFE HARMONIC BRIDGE** indicated by the arrow in the illustration, none can hope to equal the unparelleled tone of the New Scale Williams Piano. Your interest in securing the best piano from every standpoint will surely lead you to choose the instrument which combines with exclusive features of mechanical supremacy the most beautiful of cases and the approval of nearly every one of the world's great musicians.

Come in to-day and arrange to own one of these superb instruments.

Can you arrange the above sets of jumbled letters into the names of eight well known fruits. If so, YOU CAN SHARE IN THE DISTRIBUTION OF THE ABOVE PRIZE. It is no easy task. But by patience and perseverence you can probably make out 5 or 6 of them. To the person who can make out the largest number we will give the sum of One Hundred Dollars. To the person making out the second largest number the sum of Fifty Dollars. To the person making the third largest number the sum of Thirty Dollars. To the person making the fourth largest number the sum of Twenty Dollars. Should two persons send answers equally correct, the first two prizes will be divided between them, (each receiving $75.00) Should three send in equally correct answers, the first three prizes will have to be divided, (each receiving $60.00). Should four persons send equally correct answers, the whole sum of $200.00 will be equally divided (each receiving $50.00), and so on in like proportions, provided they comply with a simple condition about which we will write as soon as answers are received. WE DO NOT WANT A CENT OF YOUR MONEY WHEN YOU ANSWER THIS ADVERTISEMENT. If you can make out anything like a complete list, write us at once enclosing 2-cent stamp for our reply. DO NOT DELAY, WRITE AT ONCE. Address, CANADIAN MEDECINE CO., Dept. 81 MONTREAL, QUE.

FLORICULTURE.

I have received many inquiries in regard to the time for planting annuals, etc., in the beds. I would say that the time depends altogether on the weather we have for the next few days. If warm it would be safe to plant hardy annuals, such as Carnations, etc., as early as the 20th or 25th of May. But if it should be cold, wait a week longer. The season for planting will certainly be earlier this year than it was last year.

"A Gardener," West-end, St. John, writes: What plants would you recommend an amateur to plant in a small bed in a sunny back yard to grow flowers for cutting, white flowers preferred? I would like plants that are easily grown and inexpensive.

I would recommend Drummond Phlox, White Verbena, White Asters, White Stocks, Princess Alice and Mignonette. These are all inexpensive, hardy and produce a large quantity of bloom and the more flowers that are cut the better they branch and bloom.

Henry, of St. John, writes:—"We have a large bush of Golden Elder in the garden. Could branches of the Hardy Hyderangea be grafted onto it?"

The branches of the Hyderangea could be grafted onto it, but they would not grow as the habits of growth of the plants are not alike in any respect. Of course I have never tried it, but would not think there was a shadow of a chance.

A Rothesay correspondent writes:—Would a root of Golden Glow look well in the centre of a bed? How high does it grow?

The Rudbeckers or Golden Glow should stand on the lawn by itself or be used as a background against a fence or wall. It grows quite high, under favorable circumstances, and would not make a good centrepiece for a bed unless quite large.

Hampton, writes:—I have a large clump of Rose Paeonies in my garden that have been there a good many years. It did not bloom last season for the first time in years. Should it be divided? If so, how and when? Can you recommend a good, hardy shrub for the garden, one that will not grow too high? I am advised to try Cedar. What plant would be the best to hide an unsightly fence, some four feet high—one that will bloom during the summer.

The Paeonie should be divided, cut down through the top and roots, leaving about three buds or eyes in a branch. It should be done as soon as possible. Water well after planting. The Syringa, Snowball, Weigella Lilacs and Sambucus Aurea are all good, hardy shrubs and the size can be regulated by judicious pruning. The first four all produce flowers; the latter is grown for its beautiful golden foliage.

The shrub for hedge purposes would depend somewhat on your situation. I would not advise cedar unless you were in the limestone section of the city, where they undoubtedly do well. The Hawthorne and Berberry make good hedges, and also the Honey Locust in some situations, but these latter are somewhat uncertain. The best general hedge plant for city use is probably the Lilac. It can be kept neatly pruned and in any shape desired. It is not affected by any variety of insect, a fault of all others, and it is hardy everywhere. Planted thickly it soon makes a hedge of glossy leaves from top to bottom and it makes a close and perfect screen.

As regards a plant to cover fence. Climing Nasturtiums would probably do the work quickest and cheapest. Sow early. Hollyhocks make a beautiful background and soon obtain a height of four to seven feet in good soil and will give a mass of bloom all the season. Charlers strain of Hollyhocks are probably the best.

All hardy plants, shrubs, bulb beds, etc., should be uncovered at once if in sunny situation. Divide and replant hardy perennials as soon as frost is out. Sweet peas should be sown in every situation. Little is gained, however, if the soil is wet and frosty, better to wait till it warms up a little.

MOLASSINE MEAL

Made in England

is made in England and is recognized by the leading veterinary surgeons in Great Britain—used in all mounted departments of the British Army—large Cartage Companies—Omnibus Companies—and all owners of horses having heavy work to do or for show or breeding purposes. It is

Look for this Trade Mark

on every bag

A Splendid Economical Feed for Horses, Cattle, Sheep and Pigs

"MOLASSINE MEAL" is not only a good food itself but enables the animal fed on it to obtain the full nourishment from all other food. When MOLASSINE MEAL is fed regularly three times a day, you have no waste fodder of any kind. It costs you less for feed and the animals obtain more nourishment.

Get some from your dealer to-day. If he has not got it, write and let us know at once.

There are dozens of molasses preparations on the market but only **one** MOLASSINE MEAL

Write to the Department of Inland Revenue, Ottawa, for their Bulletin No. 241, on Registered Stock Foods, and see the Government analysis of MOLASSINE MEAL. It is better than its guarantee and away ahead of any other molasses food.

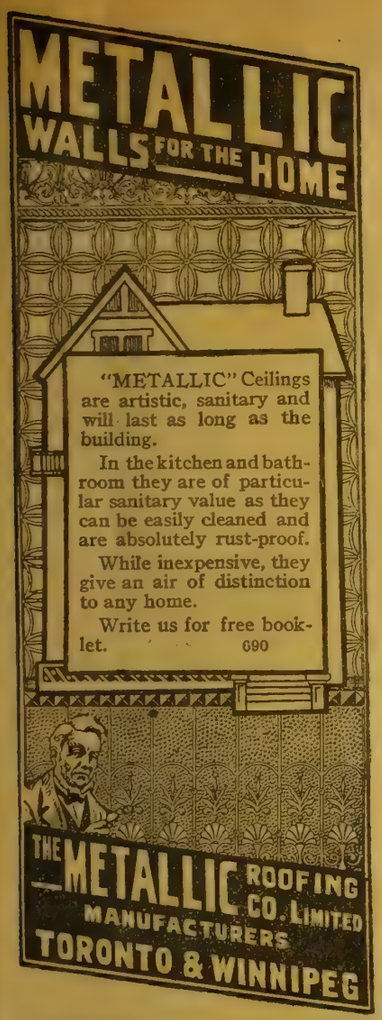
Amatite Roofing--Samples Free!

Do you know that you can investigate the new type of roofing very easily by simply sending a postal to the manufacturers of Amatite asking for one of their free samples? The manufacturers are very anxious to distribute these samples, because they want people to see what the new idea in roofing is.

Amatite is the new mineral-surfaced roofing which is becoming so popular because of its low price and the fact that it needs no painting nor care.

The mineral surface of Amatite is a practical, durable thing because it is embedded in a pitch matrix.

A sample of Amatite Roofing can be obtained by simply asking for it. Address the nearest office of THE CARRITE-PATERSON MFG. CO., Limited, St. John, N. B., Halifax, N. S.



Commercial Fertilizer.

(Continued from page 587)

Nitrogen—.82 per cent.
Sol. Phos. Acid—4.00 per cent.
Potash (K2O—2.00 per cent.

This fertilizer is recommended where the land is in good natural condition or where manure is so plentiful and cheap that a fertilizer is chiefly used to start the crop. It says that there is enough Nitrogen to start the crop growing and recommends 1200 lbs. with manure. If 1200 lbs. was used on an acre just 9.84 pounds of Nitrogen would be spread over that acre and then the buyer would get 4 lbs. of Phosphoric Acid to the 100 pound bag and 2 pounds of Potash. The farmer who buys the above grade of fertilizer will have to look to some other source for profit beside the crop he would grow from it.

If a farmer would know the value of any fertilizer he is asked to buy, let him multiply out the value of each of the three ingredients offered and expressed in the analysis on every bag denoted by the percentage, by the price of plant food per pound which can be obtained from any fruit company in the Annaplis Valley.

I have written this article with the sole object of trying to help the farmer of moderate circumstances, or the man who has generally bought on the ton basis never asking the question what quality of goods he was getting—W. H. Woodworth, Berwick, N. S.

Flash Favorite Comes to Sussex

Mr. Hugh R. McMonagle, of Sussex Corner, N. B., has purchased the famous Clydesdale Stallion, Flash Favorite to use in the stud and cover the routes in Kings and Queens Counties formerly travelled by his popular stallion Stanley, which has recently been sold to Mr. Donkin, of Cumberland Co., N. S.

Flash Favorite is by Royal Favorite, whose colts won so extensively over the get of some of the most popular Scotch Stallions at the recent Castle Douglas and other Scotch spring horse shows.

Flash Favorite was imported from Scotland by Prof. M. Cumming, to head the Clydesdale Stud at the N. S. A. C., Truro, where he gave a good account of himself as a sure sire and the getter of quality stock. Prof. Cumming was offered fifty per cent. over the purchase price for Flash Favorite the next day after he purchased him in Scotland.

Following the tracks of Stanley, whose get are in high demand in New Brunswick and where they change hands at top notch figures, Flash Favorite has a foundation where he will have ample opportunity to uphold his past good record as a sire.

Sicilian Buttercup Fowls.

These are now in the "spot light." The peculiarity of these fowls is the comb, which resembles the buttercup in shape.

The pullets are said to lay 300 good sized eggs yearly. They are said to be the most active breed on earth; anyway they are being largely boomed, and birds are changing hands at good rices. The States seem to be the headquarters for this breed.

The Buttercups should be popular if they lay 300 eggs per annum as stated. I hope no one will bring out a "Daisy" breed that lays 301 eggs, we might doubt the extra egg. We are now only 65 eggs off getting an egg a day from each kullet, but as the Scotchman said "Surely ye wad no expect the hens to lay on the Sabbath day"—of course not, so we are nearing tne limit now.—from "Canadian Farm" February 7, 1913.

Making a Compost Pile.

To make a compost pile proceed as follows: Place a layer of sod with the grass side downward over about a square yard of level ground, then a second and third layer in the same way. On these place four inches in depth of either of the fertilizers named. Continue these successive layers of sod and fertilizer until the pile is three or four feet in height, finishing up with a layer of sod or soil on top. Fall or early spring is the best time to do this. Place wire netting over the pile to keep off chickens and animals. Throw a few pails of water on the pile in summer to hasten decomposition. Cut down with a sharp spade a portion of this from top to bottom of pile when ready for use, so as to get equal quantities of soil and fertilizer. It should then be passed through a coarse, three-quarter inch mesh sieve, or the material chopped or pulled to pieces before using, so as to retain all the fibry and organic part of the soil possible.—Wm. Hunt, O. A. C., Guelph, Ont.

Why Red Rose is a "Distinctive" Tea

Because it is largely composed of the fine teas of Northern India, which are generous in strength and richness. These, blended with the flavory teas of Ceylon, produce the qualities for which Red Rose is famed.

N.B.—Coffee users will find Red Rose Coffee as generously good as Red Rose Tea.

Potash Produces Profit

Intending Users of Fertilizer materials should purchase them at once. POTASH and Phosphatic materials cannot be applied too soon if this year's crops are to obtain full benefit from them.

Farmers are invited to communicate with us and we shall send, Free, any of the following bulletins. State which are required:—

"Artificial Fertilizers; Their Nature and Use"
"The Principal Potash-Crops of Canada"
"Potash in the Prairie Provinces"
"Fertilizing Orchard and Garden"
"The Potato Crop in Canada"
"Fertilizing Fodder Crops"
"A Farmer's Field Tests"
"Farmer's Companion"

Expert advice on all matters pertaining to fertilizing. Send us five or more names of your neighbor farmers and we shall send you a coloured wall placard.

GERMAN POTASH SYNDICATE

1105 I. O. F. Temple Bldg., Toronto

Romance in an Apple Orehard.

BEN DAVIS was an awful flirt. He was a TALLMAN and handsome, a native of SPITZENBURG HOLLAND. He became hopelessly smitten on BELLFLOWER, who looked like a DUCHESS, dressed beautifully in a RUSSET gown. His attentions to her were so SWEET that he made the MAIDEN BLUSH.

Now she was engaged to another MANN. Although he was a BALDWIN, he was WEALTHY as a KING, and when he was advised of this he SWAAR, and with rage turned white as SNOW, and nearly took an APPLE-eptic fit.

He at once engaged a SPY, who soon informed him that he need SEEK NO FURTHER for her affections. He immediate left ONTARIO for a NEWTOWN down on the ST. LAWRENCE, where he met a ROME BEAUTY, and now he declares there are NONSUCH as she.

Udder Trouble.

R.F.—We are experiencing more and more trouble with udders caking or getting hard from two to four weeks before the heifers drop their calves. We have had an idea that if we treated such udders very long before the cow calves, say, two or three weeks, that it would be likely to start her milking and we have been of the opinion that it is not a good thing for a cow to start milking before she drops her calf.

Watch young heifers to see that they do not suck one another's udders. This is a common habit and a fertile cause of spoiled udders in cows. Separate calves at the first sign of the habit when a heifer's udder becomes enlarged before calving. Reduce feed, increase exercise and two or three times a day massage udder thoroughly but do not attempt to milk. But toward the body to stimulate flow of venous blood from the udder toward the heart. At night rub in warm melted lard or sweet oil or soft soap. Do not use camphor. It dries off milk.

Troubled With Weak Heart.

Was All Run Down.

Many people are unaware of having anything wrong with their heart till some excitement, overwork or worry causes them suddenly to feel faint or dizzy, and have an all-gone sinking sensation.

On the first sign of any weakness of the heart or nerves, you should not wait until your case becomes so desperate that it is going to take years to cure you, but avail yourself of a prompt and perfect cure by using Milburn's Heart and Nerve Pills.

Mr. Thomas A. Stevenson, Harris, Sask., writes:—"I was troubled with weak heart, and was all run down for a long while. I was almost in despair of ever getting well again, until a friend recommended me to try Milburn's Heart and Nerve Pills. After the first box, I was much better, and three boxes cured me. I am now, as well as ever, and will highly recommend them to any one else troubled with a weak heart."

The price of Milburn's Heart and Nerve Pills is 50 cents per box, or 3 boxes for $1.25.

For sale at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Alfalfa the Farmer's Friend.

In alfalfa we have a valuable leguminous food for all our live stock, and one that embodies many merits, namely, richness in protein, digestibility and palatability. For balancing the dairy ration, alfalfa is of the greatest value. It furnishes the most desirable bulky food for profitable poultry raising.

Alfalfa is not economical for fattening beef cattle, inasmuch as considerably less corn is needed when alfalfa is given as roughage. For hogs and for sheep it has proved the chepest feed we have, and its value for keeping our horses in good condition should not be lost sight of.

The fertilizing worth of alfalfa is very high when plowed under. Being a deep feeding plant, alfalfa sends its roots out in innumerable small branches, which gather more moisture and mineral matter than other plants can reach.

Alfalfa is not difficult to grow an lands of varying character, providing a few important points are observed. The first step to secure a successful stand is to sow good seed. There is much poor and sterile seed upon the market.

IT PAYS TO TEST THE SEED.

The writer has always made it a point to test out his seed, and the little trouble so taken is time well expended. Two years prior to seeding down ten acres, several sample lots of seed were obtained from as many dealers. A part of each sample was mailed to the state college for analysis, while I tested out the remainder. Of the six samples sent and returned with reports, but one lot of seed was marked A No. 1.

My own simple tests made by placing the seeds on a sheet of wet blottingpaper between two plates tallied with the college report. Needless to say the high test seed was purchased, although the dealer's price was somewhat higher for this lot than asked by any of the others. The seed cost me $15 per bushel of 60 pounds, and today my alfalfa field is considered the best stand in this section, yielding seven and eight tons to the acre.

Success in getting a good stand of alfalfa depends dpon the character of the soil and upon the thorough preparation of the seed bed. Alfalfa does well on nearly al, rich soils, with the possible exception of poorly drained and heavy clay lands. Limestone lands are ideal for producing a heavy crop, and, indeed, a sweet soil is necessary for success. If your soil is deficient in this element, lime should be added in sufficient amount.

SOIL FERTILITY AND INOCULATION.

Since alfalfa requires a rich soil, barnyard manure should be liberally and evenly spread and then plowed under. In the preparation of the seed bed it is important to free the field of weeds so far as possible, and this should be well done, because alfalfa will make a good stand for eight 10 years, and the farmer can afford to devote time enough to make a thorough job of it.

Another point in soil inoculation, and this may be regarded as an absolute necessity for establishing a good stand. The needed bacteria may be conveniently supplied by procuring a quantity of soil from an old field which has been seeded to alfalfa for several years. Use as much of this inoculated soil as possible: a wagonload to the acre will do the work, but double this quantity will be better.

The inoculated soil should be scattered over the field broadcast by hand or by means of an endgate seeder or a fertilizer drill. Another method of introducing the friendly bacteria is to innoculate the seed by using one of the preparations put up for this purpose.

If your land is clean and rich it maybe seeded down early in the spring. This may be in the latter part of April in some sections, while in less favorable climates and soils it will be safer to sow during June and July, or even wait until August.

The seed is generally broadcasted at the rate of 25 to 30 pounds to the acre,but may be drilled if cultivation is considered desirable. In either method of sowing, shallow planting is advisable, and aside from thorough soil preparation and inoculation, most failures to secure a good stand are undoubtedly due to improper and deep planting.

The writer's method is to plow in the spring as for corn, and run the harrow over the field every week to destroy weeds. The seed is then broadcasted and well harrowed in. A nurse crop to offset possible failure to secure a good stand appears of doubtful value and is, in fact, unnecessary if the land is properly prepared. A good seed bed is needed for the young plants are somewhat tender. But given a good start, it makes a wonderfully rapid growth and soon sends its roots deep down in search of plant food. With a good seed bed free from weeds, well inoculated soil seeded down with good seed, you wil, find that alfalfa will do as well and probably prove more profitable than any other crop.

Alfalfa stands cultivation better than most grains, and is benefited by frequent mowings. The point to be attended to is to keep the soil loose and open, and to disc it when it becomes too compact. In many cases it is of considerable value to run the disc harrow over the field after mowing. Alfalfa roots are deeply set and the disk will not reach them, providing it is set properly and in a fairly vertical position to avoid cutting the crown of the growing plants.—Chas. S. Taylor, Middlesex, Co., Ct.

To Women Who Dread Motherhood

Information How They May Give Birth to Happy, Healthy, Children Absolutely Without Fear of Pain—SENT FREE.

No woman need any longer dread the pains of childbirth. Dr. J. H. Dye devoted his life to relieving the sorrows of women. He has proven that the pain at childbirth need no longer be feared by woman and we will gladly tell you how it may be done absolutely free of charge. Send your name and address to Dr. J. H. Dye Medical Institute, Canadian branch, Dept. 110 St. Mary's, Ont., and we will send you, postpaid, his wonderful book which tells how to give birth to happy, healthy children, absolutely without fear of pain, also how to become a mother. Do not delay but write TO-DAY.

Shubenacadie, N. S.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

THE ADVERTISING PAGES of the Maritime Farmer will help you to get the most value for you money.

Mindful of Small Matters.

(Continued from page 579)

the other breeds may make just as good broilers, if they do not come up to the standard required for their appearance, they are apt to be severely cut in price.

Never introduce a new bird into the regular yard until it has been duly quarantined. Keep it alone for a week and note its condition, appetite, etc. Disease is often introduced into a flock by carelessness in this matter.

As a general thing, not enough attention is paid to the family history of fowls for breeding purposes, as regards their health. Constitutional weakness, though it be apparently overcome, should never be allowed to enter the breeding pen.

To perpetrate health in a flock of fowls breed only the robust and healthy specimens, making sure that both parents are of healthy and prolific ancestry. Never under any circumstances use a male that is unsound, but rather seek to have him as nearly a perfect specimen as possible.

Fowls have no sense of smell. They have nostrils, but not noses.

Anna C. Webster says nearly all the diseases of poultry, summer and winter, can be put under one or two classes; inherited or caused by unnatural conditions of food. If we classify them thus broadly, it may be simplifying matters for some so they can more intelligently stamp them out.

Naturally, fowls are healthy, and no other stock on the farm has been so much abused. Yet in spite of all the ill-treatment they receive they do much better than any other stock on the farm of equal value.

A gill of linseed meal contains more bone-forming matter than a pint and a half of corn, and as much nitrogen as three gills of corn.

In selecting ducks for breeding, size of frame, length of body and general activity should be looked for. Without size of body we cannot expect to obtain large ducklings.

In Iceland the Eider duck is a great source of wealth as a producer of the famous Eider-down. They are large and easily handled, having been domesticated thoroughly. The color of the duck is a grey and brown mottle, while the drake is black and white.

The Vale of Aylesbury is the great center of duck raising in England. None of the duck farms are large—probably from half an acre to an acre. This is utterly devoid of vegetation on the surface, the grass being worn away by the dabble of countless feet. The ducks that are confined to orchards are, as a rule, much more healthy looking than those which are kept in the open. Doubtless the trees take up as a food much of the manurial foulness of the soil.

Both sexes in geese are feathered exactly alike, which makes it difficult to distinguish ganders from geese, especially when young.

Some poultrymen, in order to have a regular supply of eggs throughout the year, have a pen of two-year-old hens, one of yearlings, and one each of February, March, April and May hatched pullets.

The three sizes of roasting fowls—small, medium and large—can best be secured by the Wyandottes, Plymouth Rocks and Brahmas, respectively. The Rhode Island Reds can be substituted for the Plymouth Rocks if desired.

In market quotations the term "Asparagus chickens" is often used and not understood. It refers to chickens large enough to broil with early asparagus. They are usually hatched in late July and August, pushed along till November, then killed and put in cold storage for the winter. They are taken out and eaten in the spring.

JOHN RICHARDS,
Bideford, P. E. Island,
Breeder and Importer of

Clydesdale horses of the highest quality and breeding—the stud includes the noted show and breeding horse "Baron Kelvin." Every brood mare is a first prize winner at Scotch and Canadian shows. Driving horses generally on hand. Shetland ponies of the smallest type and best breeding. Polled Angus cattle of the most fashionable strains. Herd won first prize Toronto in 1906 and many other shows. Also small herd of Shorthorns from imported deep milking families.

Say I Saw It in The FARMER

DISPERSION SALE OF

60 Head of

High Class and Show Ayrshires

We purpose dispersing our entire herd of pure bred and Grade Ayrshires now on our farm at

FOREST GLEN

Westmorland Co., N. B., on

Friday and Saturday, May 23 & 24

A strict record has been kept of each and every cow in the herd and as the food consumed by each cow has been charged against her production, boarders were quickly spotted and disposed of. This rigorous record keeping and weeding has brought the herd up to a good average producing capacity.

A Portion of The Forest Glen Ayrshire Herd at Pasture.

Terms : Under $50.00 Cash. Over that amount notes will be accepted with approved security, bearing interest at 6 per cent for four months.

Sale will begin at 11 o'clock. Luncheon will be served.

For nearly four years this herd has been headed by the richly bred bull "St. Louis King"--27094--a son of the noted Show bull and dairy sire "Pearlstone of Glenora" a many times winner in Canada's leading exhibitions and in 1909 was selected by A. S. Turner & Sons to head their world famous dairy herd at Ryckman's Corners, Ont.

The dam of St. Louis King "Vera of Kelso" is one of a family noted as producers and showring winners, her full sister Lily of Kelso was winner of the Canadian bred class at Sherbrooke, Que., 1909.

St. Louis King is of good size, ideal dairy type and conformation, and a look at the 30 or more of his offspring in this herd (or sale) will convince the most critical that he is breeding true to type and dairy conformation.

Wouldn't YOU Like To Be Able

To know—when to sell your live stock and produce so as to get the best market prices.

To get the weather reports in *advance* and so avoid damage to your crops.

To order spare parts for broken farm machinery, without having to lose time and drive miles to do it.

To summon medical assistance—instantly—in case of illness or accident.

To talk to your neighbors at *any* time—day or night—or get their help in case of fire.

To get the veterinary *quickly* when sickness strikes your live stock.

You Can Do All This—and Much More When You Have a Telephone

YOU CAN get a Telephone *at a small cost* if you will send us your name and address.

YOU and your neighbors can build, own and operate your own, Self-paying Rural Telephone System at a cost to each of the value of about 20 bushels of wheat.

WE—the Northern Electric & Mfg. Co., Limited—the *largest* and *oldest* telephone manufacturers in Canada—will *help you* to do it and *guide you* in every step of the construction work.

OUR FREE BOOK—How to Build Rural Telephones—the *most complete* work of its kind ever published—is yours for the asking.

IT TELLS you how to form a company—what material is necessary, and how to build your own line—how to operate a Rural Telephone System from start to finish—in clear, straightforward language that a child could understand.

IT CONTAINS one hundred pages—profusely illustrated—and makes the construction of a telephone system as easy as building a fence.

BE THE FIRST man in your district to suggest the idea to your neighbors. Study our Free Book so that you will know all about Rural Telephones—then it will be easy to interest your friends.

YOU CAN GET our book by simply writing for it—it costs you nothing—and we will be glad to know that you are interested.

Barn Equipment That Pays For Itself

More and *better* milk—higher prices for it. That's the certain result of stabling your cows in a *modern* barn, fitted up with BT Sanitary Steel Stalls and Stanchions.

Less disease among the cows; veterinary bills cut in two, for Steel Stalls do not harbour disease germs. Besides, there are six special patented features on BT Stalls that help to prevent Tuberculosis, Abortion, and do away with Big Knees, Ruined Udders, Over-Feeding, Under-Feeding and other Cow Ailments.

Less work and time to keep the stable clean, and less work to feed, water, and care for the cows.

These are facts! They have been *proven* to thousands of your fellow dairymen and farmers. Ask them! They will tell you that BT Stalls pay for themselves *in the first year alone* by increasing the profits from the cows and by saving dollars and cents in the dairy barn.

Write today for stall book and read *all* the information about

BT STEEL STALLS, STANCHIONS, PENS, Etc.

Read in our Stall Book about our Swivel Stanchion that allows the cow to turn her head to either side, lie down on either side, and card herself on almost any part of her body. Gives her the greatest possible comfort in her stall.

Learn about the BT Patented Aligning Device that lines up all the long and short cows evenly over the gutter so the manure falls right into the gutter and does not get on Cattle-stand, on bedding or on cows.

Learn about the *Swinging* Sure-Stop post. Double-Curve Steel Partitions, Self-Cleaning Steel Mangers, Stanchion Rests. Investigate all the advantages of BT Equipment and know why it is the favorite everywhere with Dairymen who want the greatest efficiency in their barns.

Mail coupon today for Stall Book. It is Free.

Three cows and a

DE LAVAL CREAM SEPARATOR

will make more money than four cows with gravity setting

Thousands upon thousands of cow owners have already proved this statement; any experienced dairyman will verify it for you.

With such a big saving it is hard to understand why any cow owner should try to get along without a De Laval Cream Separator.

If you are selling cream or making butter, and have no separator, or else an inferior machine, we know if we could put a De Laval on your place we would be doing you a personal favor.

If you haven't a separator don't make the mistake of starting with a "cheap" or inferior machine. When you do buy a separator—as sooner or later you surely will—be sure to get the best—the De Laval.

Remember, you can't make money by trying to save money in the purchase price of a cream separator. A De Laval costs only a little more than the cheapest and will save you twice as much and last five to ten times as long as other separators.

DE LAVAL DAIRY SUPPLY CO., LIMITED

Wood or Concrete Silos which are best?

Over in the U. S. many experiments made by the various agricultural experiment stations have conclusively shown that **silage does not keep as well in cement, stone or brick silos as in silos constructed of wood.**

Furthermore, the advantage of the wood silo over cement, stone or brick is greatest in a cold climate.

The vital question is "Which silo will keep the silage in the best condition."

If you are interested in reading the unbiased opinion of scientific investigators who have given this question careful investigation we shall be glad to send you, upon request, reprints of some of the experiment station bulletins giving in detail the reasons why wood silos make the best silage and keep it in the best condition.

We shall also be pleased to send you our silo catalog and give you any other silo information desired.

We are exclusive distributors in Canada of the World's Standard De Laval Cream Separators and also carry a complete line of creamery and dairy machinery and supplies. If interested write for separate catalogs.

Care of Milk and Cream on the Farm

By J. H. Frandsen, of the Nebraska Agricultural Station.

MODERN methods and machinery have done much to improve the quality of creamery butter, but the most skilful buttermarker using the best of machinery cannot overcome the evil effects arising from the filthy methods followed by some cream producers.

Unfortunately many dairymen do not realize this condition of interdependence which really exists between the creamery and the cream producer. Good butter cannot be made from an inferior grade of cream. The better the quality of the butter produced the greater will be the demand. The high grade butter commands the highest price, even when the market is well stocked with the lower and cheaper grades of butter. If the creamery is forced to sell at a lower price owing to the poor grade of butter produced, it follows that the creamery cannot pay as much for the butter fat. Dairymen lose thousands of dollars annually, due to the lower price paid for poor butter.

CLEANLINESS.

It is not easy to say just what is the most important feature in the production of clean milk. Special stress may be placed upon some particular step, yet if carelessness is allowed to rule at other steps much of the most painstaking care would count for naught in the final results.

Clean and sanitary conditions are factors of first importance upon which too much stress cannot be laid. It is impossible to produce good milk or good cream if dirt of any kind is allowed to get into it. Unless some precaution is taken at milking time, dirt and dust will be sure to fall into the milk from the flanks and udder of the cow. The greater part of this filthy matter dissolves in the milk, giving it not only undesirable odors and taints, but also inoculating it with various kinds of bacteria.

These germs may have been gathered from stagnant water, muddy pools, or miry yards. While the majority of them may not be disease-producing or especially harmful should they be transmitted to the human system, yet, to say the least, they are factors in bringing about decomposition of the milk. Filth and disease germs go hand in hand; the same carelessness that allows the one is likely to give access to the other. Hence, it is of the highest importance that the cow be kept as nearly clean as possible. This can be accomplished largely by brushing off all the loose dirt and dust from the flanks and udder, but it is even better to wipe the udder with a damp cloth. This will take but a moment and will prevent large quantities of filth from getting into the milk.

The Illinois Experiment Station has carried on some experiments to determine the amount of dirt that falls from the cow's udder and flanks during milking time. The following quotations from Bulletin 84, Illinois, give some interesting results.

"It was determined after several trials with three different milkers on thirty cows that it requires an average of 4½ minutes to milk a cow. A glazed dish eleven inches in diameter, the size of an ordinary milk pail, was placed in the top of a pail and held under the cow's udder in the same position as when milking. For 4½ minutes the milker went through the motions similar to those made in milking but without drawing any milk. The amount of dirt which fell into the dish during the operation was, of course, approximately the same as would have gone into the milk during the milking process. The dirt caught in the dish was then brushed into a small glass tube, the udder washed and the process repeated. The dirt which fell from the washed udder was also carefully brushed into a weighing tube. Both tubes were then placed in a desiccator and after drying twenty-four hours were accurately weighed on a chemical balance."

"Sixty trials were made at different seasons of the year. With udders that were apparently clean it was found that an average of 3½ times as much dirt fell from the unwashed udders as from the same udders after they were washed. With soiled udders the average was 22 times and with muddy udders the average was 94 times as much dirt from the unwashed udders as from the same udders after washing."

It should be well understood that the amount of dirt that gets into the milk is one of the chief causes of its rapid spoiling. Although some farmers think that the creamery-man can, in some mysterious way, remove the dirt and all its attendant evils, it remains a fact that the contamination resulting from dissolved filth cannot be entirely eliminated.

Many milkers have not as good a conception as they should have of the ease of contaminating milk from their person or clothing. After doing such work as feeding, cleaning the barn, or other dirty work, the hands and clothing are sure to have on them dirt and filth, which in many cases abounds in disease germs. The milker interested in a pure, wholesome product should insist on always washing his hands before milking and on wearing a special suit while milking. This suit need not be a white one, but such a suit has the advantage of at least showing when it has become soiled; and furthermore, if the milker is to keep it clean he will soon be forced to keep everything about him clean. Milking with wet hands is a dirty practice, especially when the udder or hands are dirty as the filth is washed into the pail.

The warm milk as it comes from the cow offers a splendid medium for the favorable growth of all kinds of bacteria that may gain access to it. In order to lessen this development, milking should be done as carefully and quickly as possible and the milk strained through a metallic strainer. Do not use a cloth strainer, for even under good conditions this soon becomes a hotbed of bacteria. The milk should be removed from the barn and barn atmosphere as soon after milking as possible.

CARE OF MILK UTENSILS.

To thoroughly clean milk utensils they should first be rinsed with cold water to remove all particles of milk. Then they should be thoroughly scrubbed with a brush in warm water to which a small quantity of good washing powder has been added. A washing powder free from grease is much to be preferred. After this they should be steamed or at least rinsed in boiling water. No wiping cloth of any kind should be allowed to come in contact with them after the scalding process. Sunlight is one of the best disinfectants and when possible all utensils should be placed in good sunlight and pure air.

The separator, of course, must also be thoroughly cleaned. No one should place any confidence in an agent's claim of separators being able to wash themselves by simply running water through them. Such claims are not made by men who have the dairymen's interests at heart. Washing a separator is not a very difficult task if done soon after separat- The water for washing should be warm, but not hot enough to cook the curd on any of the parts. If it is not convenient to wash the machine immediately after separating, the bowl should at least be taken apart and immersed in water. This will loosen all the curd and make washing comparatively easy. If the parts are scalded with hot water or steam after washing and left in a sweet, clean place to dry, no wiping with a cloth will be necessary.

The best milking pail is the one so constructed that it will reduce to a minimum the amount of dirt falling into the milk during the process of milking. The small-top pail may have some objections, but its advantages are so evident that it is rapidly being adopted by most of our prominent dairymen.

All milk utensils should be heavily tinned and as free from seams as it is possible to get them. All crevices and seams should be flushed full and smooth with solder. If pails of this kind cannot be purchased, take your pails to a local tinner and have him fill up all crevices with solder. Wooden pails readily absorb milk particles, making it almost impossible to keep them sweet and clean, and for this reason they should have no place in the dairy.

SANITARY MILK PAILS.

The milk house or milk room should be separate from the barn, so that no odors from the barn will penetrate it. It need not be expensive but should be built so that sunlight and ventilation are not obstructed. It should be provided with plenty of cold water, and there should also be some method of providing hot water or steam for cleaning the utensils. It should have smooth walls and ceiling such as can easily be kept clean, and should be so built as to provide an abundance of light. During the summer time the windows and doors should be so screened as to exclude all flies. The milk house should not be used as a general store room.

CARE OF CREAM.

Investigators have found that nearly all the chemical and bacteriological changes in cream take place in the serum or milky part; therefore the richer the cream the better it will keep, other conditions being the same. By skimming a rich cream, more skim milk is left at home for feed and there is also smaller bulk on which to pay express charges. For these reasons it is generally advisable to skim cream testing from 35 per cent to 45 per cent butter fat.

Frequent experiments have shown that cool (low) temperatures will

greatly retard the growth of most germs, and that cream quickly cooled will keep sweet much longer than when it is allowed to coll gradually.

The practice of adding warm cream to cream that has been previously cooled is recognized as being extremely undesirable, because the warm cream raises the temperature of the whole mass sufficiently to start the dormant bacteria to activity, causing them to multiply rapidly, producing large amounts of acid and also other undesirable fermentatfons before the cream is again cooled to a point where their growth is checked. Warm cream should be thoroughly cooled before it is added to the cold cream.

This department has carried on experiments to determine the value of cooling. A can of warm, fresh milk was divided into six lots and held at different temperatures as shown in the following table:

Table 1.—Showing the importance of holding cream at low temperatures.

Temperature of milk	Time held	No. of bacteria per cubic centimeter
32 degrees F	10 hours	3,300
50 degrees F	10 hours	11,580
60 degrees F	10½ hours	15,120
70 degrees F	11 hours	188,000
80 degrees F	11 hours	2,631,000
90 degrees F	11½ hours	4,426,000

A very simple and efficient way of cooling the cream quickly as it comes from the separator is by means of a small "Baby Cooler". A cooler of this kind costs about $2.50 and may be used with running water, crushed ice, or cold well water.

As soon as separating is finished, the cans containing the cream should be placed in cold water and the contents well stirred.

A very efficient and satisfactory cooling tank has been in use here, and in a modified form is used by many practical dairymen. The tank should be not less than 18 inches wide and 26 inches deep, and as long as desired. The length will depend upon the number of cans to be taken care of. It is made of 1½ inch material, and is fitted inside with a slatted bottom made of 1-inch strips. This slatted bottom is to allow the cold water to pass under as well as around the sides of the cans. The cold water supply pipe is connected directly with the pump and discharges within about 5 inches of the bottom of the tank. At the opposite end is an overflow pipe to carry off the surplus water. This overflow is piped to the stock tank, so there is no unnecessary waste of water. The cool water directly from the well enters by the inlet pipe, and being discharged near the bottom it is distributed through the tank and displaces the warmer water, which rises and is carried off by the overflow pipe. In this way the water is changed frequently and the cream kept quite cool. A tank as described may be built on the farm at a small cost. Where such a cooling system is used and other necessary precautions observed, it is possible to keep cream in good condition for several days, even in very warm weather.

In those parts where it is exceedingly difficult to secure a good supply of cold water, or in the newly settled sections where as yet not enough dairying is done to warrant the building of a milk house and cooling tanks, pits or shallow wells could be used for storing milk and cream. Experiments indicate that these pits may have a temperature of less than 70 degrees when the actual temperature in the shade was 104 degrees F. When these special pits are used for no other purpose, the milk and cream is usually of a much better quality than would be the case is it had been stored in the ordinary cave or root cellar containing vegetables of all sorts. It is a well-known fact that milk and cream readily absorbs odors from anything that may stand near them.

A well or pit suitable for the cooling of the cream should be about ten or fifteen feet deep and can be cemented, bricked, or boarded up as seems best under local conditions. It is not expensive and no particular skill is required to construct a pit of this kind. A simple hoisting apparatus with counter weight is easily arranged. Two guide wires running from the upper framework to the two stakes in the bottom of the well will keep the elevator in place. The size of the elevator and of the counter weight depends of course upon the load to be carried, and can be varied to meet the needs of practically all conditions.

The writer knows of dairymen, who because they realize the importance of quick cooling, and by keeping the cream in cans surrounded by ice-cold water until time for delivery, have worked up a trade for sweet cream which brings them fully twice the usual butter-fat price.

It is well to remember that it is the cooling of the cream and not the mere fact of getting it into water that is so important.

If the cream is stirred faithfully it will in a few minutes be reduced to the same temperature as the water in the tank, while if put into the tank without stirring it may remain warm for several hours. It is needless to say that just so long as the cream remains warm the bacter,a which even under the most sanitary conditions have gained access to the cream will not be hindered in their growth. The vast majority of milk bacteria, however, grow very slowly at the temperature of ordinary cold water; hence the importance of cooling the cream very qyickly.

In all parts of the provinces, ice may be put up at a very small cost during the winter. Farmers should avail themselves of the opportunity and put up a supply for the dairy and family use. Aside from its use in the dairy there are many places where a supply of ice could be used to good advantage; such as for ice cream making and for cooling the refrigerator so much desired by the housewife on the farm.

While the cream is cooling, the lid should always be removed from the can, thus giving the animal odors a chance to escape. A clean, dry cloth may be substituted as a protection from flies and dust. No vegetable or an- substance having strong odors should be allowed close to the cream as such odors are readily absorbed.

The cream should be delivered not less than three times a week during the summer. If cream is hauled to the station early in the morning and the cans protected by covering with a wet sack while on the road to the creamery or station, the farmer will be enabled to deliver the cream at a much lower temperature than would otherwise be possible. During the winter time the cream need not be delivered oftener than two or three times a week.

Some one has well said, "Clean cream, cold cream and rich cream are the three words which tell the secret of producing good cream.

It is believed that these few suggestions and such others as will occur to the intelligent farmer will aid him in producing a cream that will be sanitary and wholesome, and one that should easily secure the highest market price, whether it is sold for direct consumption or whether it is used for butter-making purposes.

SUMMARY.

It is impossible to produce clean milk and cream unless the cows, stable, milker, utensils and separator are clean.

To wash milk utensils use, first, cold water for rinsing; second, warm water containing a small quantity of good washing powder, for cleaning; third, boiling water or steam for sterilizing.

Use a metallic strainer; it is practically impossible to keep cloth strainers sweet and clean and free from bacteria.

Skim the milk as soon after milking as possible, and cool the cream at once.

Skim a cream testing from 35 to 45 per cent—the richer the cream the better it will keep. By skimming a rich cream, more skim milk is left at home for feed, and there is also smaller bulk on which to pay express charges.

Do not mix warm new cream with cold cream until it has been cooled.

Keep the cans of cream in a tank of cold water until time of delivery.

Wash the separator thoroughly after each separation.

Deliver the cream to the creamery or cream station early in the morning.

Deliver the cream not less than three times a week during the summer, and twice a week during the winter.

Protect the cans of cream from the sun by covering with canvas or with a wet sack while en route.

Silage Crop Advantages.

The soiling system offers a great many advantages over pastures. By "soiling" is meant the growing of a succession of crops, cutting them and feeding green to animals in an inclosure. First, it saves land; second, it saves fences; third, saves food; fourth results in better condition and more comfort for the farm animals; fifth, a greater production of beef, milk, wool or mutton; sixth, increased quality and quantity of barnyard manure; seventh, more animals can be kept on a small area of ground, and eighth, the boys are kept busy on the farm.

Among the disadvantages may be mentioned increased labor. On small farms, however, there is no question that increased profits more than compensate for the extra labor. In the thickly populated sections of Europe the soiling and tethering systems are used altogether. This enables the people there to keep up the fertility of their ground and to keep a large number of cows on a few acres.

To determine what soiling will do on our western irrigated farms, the following work was undertaken in Salt Lake valley, Utah, during the season of 1912. A man had 30 dairy cows. Feed was scarce because the alfalfa weevil had destroyed his alfalfa field, so he let us have the use of six acres of good ground near his barn upon which to grow feed for his cows. The land was divided into one acre tracts and planted to crops with results shown in the accompanying table:

The peas used were the ordinary Canadian field pea drilled in one direction first, and the oats drilled in at right angles to the peas afterwards. The vetch used was the Hairy or sand vetch. The corn was drilled in rows two feet apart. The drill was regulated so that a kernel of corn would drop every four inches in the row. The millet was the ordinary Russian variety. In field "H", the corn was drilled in as in field "D" and then the soy beans planted between the corn rows. The rape used was the Dwarf Essex.

On July 1st we began cutting field "A". Enough was cut in one day to feed the cows two days. Each cow was fed 40 pounds of green feed per day, eight pounds of dry alfalfa hay, and a small quantity of grain. By July 10th the peas and otas on field "A" were beginning to get too old, so the part of the field still standing (about one-half of it) was cut and dried for hay. We then began cutting field "B." The same method was followed in all of the fields. When the feed began to get a little old, the remainder was cut and dried for hay. All of field "J" was fed green. As soon as the peas and oats were removed from field "A" the land was replowed and harrowed and put into the crop as indicated in the table. The same is true of fields "B", "C" and "D."

Field	Crop	Rate of Seeding.	Time of Seeding.	Depth of Seeding.	Time of Cutting.	Yield in tons per acre.	Remark.
A	Peas and oats	1½ bu. 1½ bu.	April 16	3 in. 1½ in.	July 1-10	12 green	
B	Vetch and oats	1 bu. 1½ bu.	April 16	1½ in. 1½ in.	July 10-20	14 green	
C	Peas and oats	1½ bu. 1½ bu.	May 1	3 in. 1½ in.	July 20-30	12 green	
D	Fodder Corn	2 bu.	April 24	3 in.	Aug. 1-10	25 green	
E	Millet and vetch	1 bu. 1 bu.	May 15	1½ in. 1½ in.	Aug. 10-20	22 green	
F	Peas and wheat	1½ bu. 1½ bu.	June 10	3 in. 1½ in.	Aug. 20-30	10 green	
G	Peas and barley	1½ bu. 1½ bu.	July 14	3 in. 1½ in.	Sept. 1-10	8 green	Same as field A
H	Fodder corn & Soy beans	2 bu. 3 pks.	July 25	3 in. 2 in.	Sept. 10-20	32 green	Same as field B
I	Peas and barley	2½ bu. 1½ bu.	August 3	3 in. 1½ in.	Sept. 20-30	8 green	Same as field C
J	Vetch and rape	1 bu. 6 lbs.	August 14	1½ in. 1½ in.	Oct. 1	6 green	Same as field D

Total, 149 tons of greeen feed-

Of the 149 tons of green feed produced, 74 tons were fed to the cows in the green state. Seventy-five tons were dried for hay. Ordinary green crops at the time of cutting for hay contain about 70 per cent water. Hay as it is put into the barn or into stacks contains about 10 per cent of water. Our 75 tons of green feed would therefore shrink about 60 per cent. in being made into hay. This would make 30 tons of hay.

Each cow received eight pounds of dry alfalfa hay per day. Figuring up for the 30 cows from July 1st to the last of October they would have eaten 14 tons of alfalfa. Subtracting the 14 tons of alfalfa from the 30 tons of hay, we still have 16 tons of hay to the good after feeding the 30 cows on the six acres from July 1st to the last of October.

Had we known the preceding fall that we were going to do this work we could just as well have fed the cows on the same land from the first of May to the last of October, as from the first of July.

We would have put field "H" to fall rye. We could have begun to cut this during the early part of May. Field "F" could have been chosen for an alfalfa field so that the first crop could have been used for feeding the

animals during June. This could easily have been done as the crops grown were not planted until the latter parts of May and June respectively. The land of course was in the highest possible degree of fertility or else these results could not have been secured.

Each crop was irrigated twice, once during the early period of its growth and again about two weeks before we began cutting it. This left the land in the best possible condition for the succeeding crop.

The total value of these crops was about $894; it cost about $150 to produce them and the value of feed after deducting cost was about $744.

This work would certainly indicate that soiling pays on our small irrigated farms, especially when fed to such concentrated machines as dairy cows.—Kimball's Dairy Farm.

Editor's Note.—While the readers of the Maritime Farmer are not obliged to irrigate their farms, the combinations for soiling crops indicated in the above article are well adapted to Maritime conditions.

Notes From The N. S. Agricultural College.

In accordance with the legislation for the encouragement of horse breeding passed by the Nova Scotia House of Assembly in 1912, all stallions offered for public service in Nova Scotia are required to be enrolled with the Nova Scotia Department of Agriculture. Up to the present time the enrolment, including applications, for enrolment, is 220, but the number should be considerably larger than that. Of this 220, seventy-six horses are Pure Bred, 76 Grades and 68 are either cross bred or Mongrel.

If the experience of Nova Scotia turns out the same as the experience of other countries, the time will not be long before the percentage of pure breds will be very much larger than it is now.

The law in regard to the enrolment of stallions was amended during the past session for the year 1914 provision has been made for Optional Inspection of Stallions for soundness, according to which any owner of a stallion wishing to have his horse inspected can have this done and a certificate issued in accordance with the report of the inspection by applying and by paying the necessary fee to the Department of Agriculture.

The correspondence received at the Department of Agriculture indicates that the present law is endorsed by the leading horsemen of the province, who evidently consider that it is a step in the right direction. The amended law, which will go into force in 1914, will strengthen the present one and will, it is anticipated, lead to a marked improvement in horse breeding in the Province of Nova Scotia.

That there is a very large interest in Nova Scotia in the growing of alfalfa and the various clovers is evidenced by the large number of applications which are being received at the Agricultural College for nitroculture for the purpose of inoculating these crops. The largest call is for nitro culture for alfalfa, but there are not a few applications for nitro culture for red clover, alsike clover, etc., and it is of interest scientifically to notice that many of those who are applying for these nitro cultures, state in their letter that they have previously inoculated their land with nitro culture and have had extremely satisfactory results.

On the College Farm the results have been much more marked in the case of alfalfa than in the case of any leguminous crops, such as red clover, etc., etc., but a number of correspondents state that from the use of nitro culture they have been able to get stands of red clover, alsike clover, etc., where formerly this seemed almost impossible.

The Department will continue throughout this year to supply nitro culture for all leguminous crops.—M. Cumming.

The Summer Silo

The summer silo is fast becoming not only popular but necessary because of its splendid aid in supplementing summer pastures and tiding the herd over the period of drouth, heat and flies. Experiment stations that have studied the subject strongly advocate its use.

The summer silo is certain to assert its value as agriculture is certain to go forward rather than backward. Pasture at present used— or abused—is a broken reed. An overgrazed acre is the costliest acre that the farmer supports. Even in normal seasons grass rests in the summer time and unless a fall and winter pasture is laid by, little good is derived from grass lands after the flush of spring. The silo supplements pastures and carries the burden of the winter's feeding.

The Indiana Experiment Station Bulletin No 13 says: "Too much dependence is usually placed upon pasture for summer feeding. Pasturing high-priced land is unprofitable in these times. If sufficient silage is put for summer feeding, which will be up each year, part can well be used found less laborious than the daily hauling of green crops for the herd. The herd must not be allowed to shrink in flow unduly, as it is difficult to bring them back during the same lactation. The young stock, destined for future producers, must not be neglected on short pasture, for the labor and expense of supplying their needs as above indicated for the herd is insignificant compared with the importance of their unimpaired growth.

who are providing a succession of fresh soiling crops and using them to

There are many intelligent farmers great advantage in helping out short pastures. "But," says Professor Frazer of the Illinois station, "there is necessarily much labor attached to prepariag the ground, planting, raising, and harvesting the common crops used for this purpose. There is usually much loss in being obliged to feed these crops before they are mature and after they are overripe. And for the farmer who can make the larger investment, the most practical way of all to provide green feed for summer drouth is to fill a silo with corn. It not only saves the labor and inconvenience in the putting in and cultivaiion of small patches of different kinds of crops, but also in harvesting from day to day in a busy season of the year.

"These soiling crops can be dispensed with and all the feed raised from one planting in one field, in the shape of corn. The whole field of corn for the silo may be cut at just the right stage of maturity when the most nutriment can be serured in the best possible condition of feeding. It also avoids the possibility of the soiling crops failing to ripen at the exact period when the drouth happens to strike the pasture. For the silo may be opened whenever the pasture fails, regardless of the date, and the silage will remain in the best condition as long as is needed. When the pasture supplies enough feed again, what is left in the silo may be covered over and thus preserved without waste, and added to when refilling the silo for winter use."

Professor Skinner of Purdee station says on this subject' "Many successful farmers with limited area of pasture make a practice of filling a small silo for summer use. It has been well established that silage properly stored in a good silo when the corn or other crop is in the most desirable condition, will keep well for several years. Many foresighted men taking advantage of this fact plan to have silage handy the year round. They are thus prepared for any unusual conditions such as drouth, scant pasture, excessively long winters, and it is altogether practical and profitable. It is desirable to have a silo of relatively small diameter for summer feeding as it is necessary to feed about three inches from the top of the silage each day in order to keep it sweet.

"There are three silos on the university farm and it is our aim to avoid having all these empty at the same time. A limited farm makes it necessary to supplement the pastures every year, and while soiling crops are grown in abundance they can not be relied upon because of the gravelly nature of the sub-soil underlying the farm, which means longer or shorter periods of drouth annually.

"It would be absolutely impossible to maintain the number of animals on the college farm that we are successfully carrying without the silage to supplement our pastures. Many farmers have come to look upon the silo as important in supplementing the pastures as it is in furnishing succulence during the winter season."

Aid in Difficult Parturition

When people breed two-year-old heifers, or rather heifers to calf at two years of age, they may expect trouble at parturition. Last year I got an idea from the GAZETTE columns which is worth the subscription price for ten years.

The majority of cattlemen on seeing a heifer in difficult parturition hasten for a rope and two or three hired men, tie the heifer's head to something solid, fasten a rope to the calf's legs and all pull together. Sometimes they secure results and as often not. In the latter case a block and tackle or a horse is the next move. All this is very brutal and equally needless, frequently paralyzing the heifers hind parts temporarily and often causing the calf to have weak ankles or crooked legs.

A far better way is to take but one assistant with an old soft piece of rope and approach quietly. Often one does not need to tie the head. By inserting the hand into the vagina one quickly ascertains if the presentation is natural. If it is, carefully fasten the rope above the ankle joint and have the helper pull, easily and steadily. The head is usually through the pelvic arch and by passing the hand around it while the man pulls gently it usually comes through in a short time. In these days of wide hipped calves there is frequently trouble in getting the hips through the pelvic arch. This is where my new idea comes in. Instead of hurting my fingers trying to work the bones past I simply have an assistant pull steadily, while I tip the animal up on its back and over on the other side. I have never known this to fail to release the hips.—Charles A. Myers, Unita Co., Wyo.

Remarks.—This correspondent is right in stating that men should not rush in and by main force attempt to extract the calf. Often parturition will be entirely successful, if the cow is given time. If help is given too early it is an easy matter to draw out the head and foreparts of the calf or foal, but the hips jam in the pelvis and the life of the young animal is sacrificed. This is especially apt to happen in mares. Time should be allowed for the pelvic ligaments and bones to relax at calving and foaling time. When help has to be given first examine to find out exactly what is wrong in the presentation, then figure out the right way to set matters straight. A change of position in the dam, as suggested by the correspondent, often helps to relieve the difficulty. It is well to remember that in every difficult protracted case of parturition the passages tend to become dry. Copious injections of a lubricant, such as warmed raw linseed oil, sweet oil, melted lard or slippery elm bark tea, will prove of the greatest assistance and, in fact, make parturition possible where otherwise it would fail.—Vet. Ed., Breeders' Gazette.

Equipping a Barn

Next to our homes, the apartments of the dairy cows should be exemplary of cleanliness and healthfulness. In cleanliness the dairy stable should be as nearly as may be the equal of the housewife's kitchen. Both are laboratories in which human food is prepared. Much of the food prepared in the kitchen is cooked and thereby sterilized, while the food prepared in the dairy stable is consumed largely in an uncooked state and the dirt and filth that has gotten into it from the surroundings remains unsterilized.

Few mothers will boil potatoes for themselves in the stable where the milk for their children is drawn from the cows, yet the potatoes would not be contaminated in the least.

In healthfulness the dairy barn should, as nearly as possible be the equal of our homes, for are not our dairy cows the feeders of many of babes and all of our children?

In order to secure this high order of cleanliness and healthfulness, the dairy barn must conform to certain general specifications. The floors, stalls, mangers, gutters, should be an equally sanitary substance. Concrete may be washed and disinfected, rendering it clean and free from disease producing organisms. The inside walls should be smooth that dust and dirt may be eliminated. Galvanized metal linings are desirable in this respect, and steel fixtures are most easily kept clean. The milk room should be separated from the main building by a well ventilated passage.

Hay should be put down in a closed feed room rather than in a passage, that the air may not be laden with dust at feeding time. The stalls should be well lighted that dirt may be seen and that the sunshine may exert its purifying and disinfecting powers. Six square feet of glass per animal or 15 square feet of floor space are usually provided. Ordinarily the lighting is more efficient from east and west windows than north and south.

Adequate ventilation should be provided for. An air flow of about 35,000 cubic feet per hour per animal should be maintained that the air of the stable may be pure and healthful. To secure this large flow of air and yet keep the stables reasonably warm is a problem. The King system with properly designed out-take and in-take flues, is at present the most practical system employed.—Prof. E. W. Hamilton, Idaho Experiment Station.

We regret to read in our Prince Edward Island exchanges that Mrs. Wm. Clark, North Wiltshire, P. E. I., passed away on the 18th inst. We have enjoyed the hospitality of the Clark home, at Maple Grove Farm, as have many other friends and strangers. Mr. Clark and family have the sympathy of a large circle of friends in their irrepairable loss.

PREVENTING FOREST FIRES

Lumbering is one of the main industries in certain sections of the Maritime Provinces, and not a few of ehe inhabitants of these sections are dependent almost entirely on it for a living. A large proportion of the residents of the towns and villages along the banks of our majestic rivers and at tide water where the mills are usually located are also employed in preparing the lumber for marketing. Thus both rural and urban dwellers, are either directly or indirectly benefitted by the lumbering operations and should ever strive to foster the industry.

The forest is also the balance wheel used by nature in controlling our climatic conditions. With the passing of the forest climatic changes occur that are not always beneficial to the best interests of our country. Thus every citizen of the Maritime Provinces whether he be engaged in the great lumbering industry or not is directly affected by the condition of our forests. How zealously then should our forests be guarded against anything that would tend to diminish their usefulness. There was a time when people thought the primeval forests of these Provinces would never be depleted and unthinkingly and sometimes wantonly the trees were slaughtered. What man failed to do along this line was accomplished by devasting fires. Thousands of acres of valuable lumber areas have been burnt over and millions of feet of merchantable timber and young trees were thus destroyed. What a tale of devastation is told by the vast stretches of burnt and barren trees one sees as he travels throughout the breadth and length of our land.

The worst feature of the whole aspect is that many of the fires causing this devastation were carelessly kindled. A smouldering, unguarded camp fire, a burning match stub carelessly thrown away, sparks from portable and passing railway trains, carelessness in burning brush when clearing land or bonfires carelessly guarded and sometimes malicious incendiarism have all lent their quota to the work of destruction.

Our lumber operators have, for some years, realized that if their industry was to be protected they, themselves must be more careful with their operations. They are now conserving the forests by protecting the young growth and in some cases they are reforesting burnt areas. Our laws are very stringent in regard to forestry regulations and fires and it behooves the rank and file of our citizens to do all that lies in their power to assist in the carrying out the spirit and letter of these laws.

We feel sure that not one of the readers of the Maritime Farmer would like to do anything that would reflect on his or her good citizenship. During dry seasons then, for your own sake, and the sake of generations yet unborn don't throw lighted match stubs where they are liable to start a conflagration. Don't leave camp or bonfires unguarded. Extinguish the fire before you leave it and in clearing land be particularly careful lest the fire gets away from you.

THE CLERGY AND AGRICULTURE

During the last seven years the editor of the Maritime Farmer has had an opportunity to visit a great many sections of the Maritime Provinces, where agricultural exhibitions, conventions and farmers' meetings are held. He has observed the interest or apathy evidenced towards agriculture by the clergy of all denominations.

The clergyman, no matter what denomination, always commands a great deal of respect in his community, and not infrequently, as he goes in and out among his people sharing their joys and sorrows, his advice is usually sought and often followed.

We have noticed that when a clergyman in a rural district takes an active interest in the temporal, agricultural conditions of his people, he is in every case more successful in getting nearer his parishioners in matters spiritual.

We have met some clergymen who are meritable leaders among their people in matters agricultural. They work with and for their people and their churches are in a flourishing condition.

On the other hand, we have met some clergymen who take no interest in the industrial affairs of their people and who seem to put on that air that leads me to think that they consider it infa dig to step dawn from their platform and occasionally get in touch with agriculture, the one great industry in which man has to co-operate with God and be his partner. Here we find a gulf between parson and people and church conditions not so flourishing as they might otherwise be.

We are glad to state that the number of clerymen and professional men who take an active interest in the work of the farmer is on the increase.

While we find a goodly number of interested clergymen in Nova Scotia and New Brunswick, our observations lead us to unhesitatingly making the statement that in this respect the clergymen of Prince Edward Island lead the way and nowhere in Canada can one find a more upright, law-abiding and God-fearing people—horsetraders excepted in all countries.

TOLL TAKEN BY WEEDS

Did you ever stop to think of the tax you are paying to keep up the weed crop?

If the township would levy a tax on your crops equal to 25 per cent of the value, you would rebel in righteous indignation, wouldn't you? Yet a good many of us permit a stand of 25 per cent weeds to occupy our fields and think we are doing pretty good farming, too.

Why not grow grain, or roots, or some other good crop, where that weed tax is now growing? The weeds give no return. They draw more heavily on the water supply and plant food supply than paying crops. Paying crops and weeds cannot occupy land at the same time. Let us grow paying crops and get profits, rather than pay taxes.

Pound for pound, the plant food required by crops and by weeds is almost the same, but weeds are better food gatherers. The greatest difference comes when the question of water arises. Weeds not only require more water, but are able to get it. From 300 to 700 pounds of water are used in producing a pound of dry matter in our common crops. We require even more. If it comes to a contest as to which will get it, the weeds will win.

BRICK AND TILE PLANT FOR P.E.I.

In the Summerside "Pioneer" we read: "Rev. "P. P. Arsenault, P. P., of Mount Carmel, has "taken steps towards the manufacture of bricks "and tiles by an improved process. He has sent "two young men to Stratford, Ontario, to learn "how to make bricks and tiles out of the superior clay known to be stored beneath the tract "of land lying between Fifteen Point and Grand "River, and he hopes to see, next year, a plant "on the shore of Lot 15 for the manufacture of "these important building materials. In this regard, it is about time that more attention was "paid in this province to brick making. The prices of building materials, lumber and carpenter's labor are already sky-high and the demand apparently unequal to the supply. The disastrous "fires in North Sydney and Moncton will conduce "to still worse conditions and the easier development of our natural conditions. Already it "costs more to build a wooden house here than a "brick one in any European country, even when "anyone can be found sufficiently condescending "to undertake the job at all."

We know Rev. Mr. Arsenault is a leader among men. He is ever ready to advance the cause of agriculture in his vicinity by prevent and example. We trust his venture along manufacturing lines will be just as successful as he has been along other lines and thus the cause of agriculture will still receive another great impetus. We feel sure the farmers will welcome the advent of a tile making plant and patronize it accordingly.

KNOW YOUR BUSINESS

Many a man knows his business from a practical standpoint who does not know the first thing about it from a business standpoint. Until a man knows how to do business as well as how to make goods he is a long way from success. One of the things most needed to-day amongst men in business generally is the cost of doing business—not so much what it costs to make goods as what it costs to put them on the market. It is a simple thing to calculate material and wages, but how few go into the intricacies of cost of distribution. Even in the cost of manufacture, how few figure on all that must necessarily enter into the actual cost of production, such as fixed expenses, rent, taxes, deterioration of plant, fuel, non-productive wages, interest on investment, until everything is in that can constitute an expense. Then the distribution cost is to be taken into account, including all that at the end of the year will accumulate against what may have come in as gross sales. The man who counts the cost is the only one who knows where he is in these days when the temptation is so great to let the other fellows make the selling price.

The Maritime Farmer cannot be made by its owners and editors alone. We need the help of many others—of you among the others. Give us the benefit of all you learn about farming and its kindred industries. If you learn something of value it is selfish to keep it from others, and besides, every man owes much to the occupation which gives him his living. All that you know is the result of experiments of yourself or of others. For these experiments made at much cost through many years you owe much and ought to pay the debt by helping others.

There is a land hunger among the people, but this is too much expressed in desire to own acres. Small farms produce large crops when managed with intelligence, and for the man who knows how to use his soils a few acres are enough. When farms are small neighbors live near each other, roads are better, schools and churches prosper and people live happy lives. The large farm is not a blessing to the country.

The most serious bar to co-operative effort amonb farmers is the distrust that most farmers feel for each other. Some farmers stand aloof from their brethern, apparently in order to prove that they know more about their business than others do. Here is a fact that they must all learn—that their interests are all mutual, identical and that they must work together in harmony if they are ever to secure and protect all their rights.

For young people who desire to prepare themselves for useful service the farm offers many opportunities not found in any other environment. Make the best use of your opportunities and prepare yourself for honorable and efficient citizenship where your character will live after you.

Where there are crops and animals to market at intervals during the year difficulties are not met in keeping up the cash expenditures of the home. Diversified crops with animal husbandry is the safest and best plan for profitable farming.

With a sincere desire to assist your neighbors there are many things that you can do. Tell them of the importance of keeping up with the progress that is being made in marketing farm products and urge them to read the farm papers.

Cost of Raising Weeds

A noted botanist of Iowa is credited with the statement that the state of Iowa is losing $25,000,00 a year because of the failure to eradicate noxious weeds. Just what basis of estimate has been used in arriving at this conslusion is not given. It no doubt is like many professional assertions arrived at by a "casual glance of inspection." It matters not, however, as to the accuracy of the statement. It serves the purpose of calling attention to the great waste of land, of soil, in the growing of a useless crop, a useless product—not only useless, but damaging to every feature of cultivated crops. Weeds are the one special feature of hindrance and annoyance in crop cultivation.

Noxious weed nuisance costs practically as much labor each year to keep down and under subjection, in most cultivated crops, as the labor in growing the crop would cost independent of weed extermination or weed suppression. The suppression of noxious weeds on most farms is not a systematic attack for extermination, but a spasmodic attack to suppress where crop demands make it compulsory in order that the crop be given a chance to struggle through to maturity, though seriously handicapped by reason of the weed interference.

State laws providing for noxious weed extermination are on the statute books of all agricultural states, or should be, even though not enforced. It is a good thing to be reminded that we are responsible, in the sense of the law, for the spread of noxious weeds from their growth on the public highways that pass through our farms, each land owner being held accountable for the suppression of the weed nuisance, so far as his land relation to the public road is concerned.

The futile effort at weed extermination on most farms, however, has made the public highway observance a ridiculous farce so far as the means of spread in a neighborhood are concerned, as the inclosed weed patches on the farms are usually a larger growthed, stronger, better quality of weed than that produced along the roadways, which are usually looked after by the road supervisors when all other means fail.

It might be a good stkdy for the farmer to take up the loss of soil fertility that he is permitting through the means of weed growth. It is possible to eradicate weeds by careful cultivation and observation of the waste spots about the farm in view of harvesting the weed crop at the proper time for killing the plant. It is not, however, so easy a matter to keep clear of weed seed where grass seeds are bought and brought onto the farm for seed purposes. — Twentieth Centurv Farmer.

Uses of the Disk Harrow

The disk harrow is one of the most valued implements on my farm. It is almost indispensable in the preparation of sod ground for potatoes or corn. Modern methods of tillage and cultivation are fast widening its scope beyond the preparation of the plowed field. Invented many years ago, its proper uses have not been discovered until quite recently.

One of the most important uses of this implement is to break up the surface sail into fine particles a few days in advance of the plow. This proves a great benefit in preparing the bottom of the furrow so that capillary attraction of moisture will be readily established with the subsoil. It effectually seals the surface of the unplowed land so that it will keep moist for a longer period of time, and consequently plow easier in case drouth comes on so as to seriously interfere with the work of plowing.

With ordinary plows, drags and spring-tooth harrows the furrows are turned over in rolls, clods and lumps and 2 or 3 inches of the upper surface prepared until it is smooth and fine. Superficial observers may think the soil is properly fitted because it looks fine and smooth on top after being harrowed and dragged; nature knows better, and yields begrudgingly to the man who plows under lumps and clods and scratches over the surface with a few light implements.

If the soil is not properly prepared to the full depth of the furrow the important details of moisture, heat, air and fermentation of the soil cannot be managed so as to give the growing crop a full measure of the necessities for growth.

When the crops are sown or planted on the upper fine surface they start quickly, but as soon as the growing roots begin to move their way downward in search of food and moisture they are frustrated by the air spaces which prevent the necessary contact with the soil particles from which water and food are derived. The free circulation of air dries the moisture out of the spaces between the lumps and clods.

Another valuable use for the disk harrow is to break down weeds and cut up trash and coarse manure. By cutting up this trash it does not seriously interfere with the capillary attraction of moisture between the subsoil and the furrow slice. The disk will at least chop up this trash and greatly reduce its capacity for damaging the growing crops. Compare a field that has been well disked and one that has only been plowed and dragged and you can readily understand the value of the implement.

In preparing oat stubble for wheat the thorough disking of the stubble land will greatly facilitate the work of plowing and prove of breat benefit to the subsequent crop of wheat. In many instances ground that is disked immediately after the oats harvest can be plowed while the adjoining fields are too dry.

The disk harrow is especially valuable in orchard cultivation, as it partially does away with the use of the walking plow, and for use among cherry and plum trees and in grape rows it is very convenient and efficient. It does not tear up large roots and can be easily adjusted to meet the varying condition of the soil in the rows. By careful driving one can work in close to the trees and vines.

For renewing old pasture and meadow lands where it is desired to reseed the ground without plowing a thorough disking and the sowing of grass seed will turn the trick. For renewing prairie pastures it is the best implement ever devised. For cultivating alfalfa fields where weed pests have gained a foothold it performs valuable sefvice.

On farms where quack grass, morning glories and some of the other common weed pests that spread from underground root systems have put in an appearance in certain parts of the fields, the use of the disk harrow prevents them from being transplanted to other parts of the field, while the ground is being prepared for a crop.. This one thing alone should commend the disk harrow on every farm where these weeds are growing. As an all around valuable farm implement I give a disk harrow the first place.—W. Milton Kelly in Field and Farm.

Tile Drainage

The cost of tile drainage will vary in different localities with the prices of labor, inequality of soils and cost of tile. Cement tile is often made at a much less cost than the farmer would be required to pay for clay tile. This is where the farmer owns his own cement tile machine and operates it at such simes when weather prevents work in the fields and elsewhere about the farm. The experience of one farmer who owns a small cement tile machine costing $60, is that one sack of cement will make 125 three-inch tiles, 75 four-inch and 55 six-inch tiles. At these figures the tiles were costing 37½ cents per 100 for 3-inch, 45 cents per 100 for 4-inch and 80 cents per 100 for 6-inch. This price is very low on account of the fact that labor or cost of sand is not taken into consideration. It requires two men to operate the machine with an output of between 50 and 60 tiles per hour. The mixture used was one part of cement to four parts of sand.

Local prices of clay tile have been variously quoted from 1½ to 3c per tile for the 3-inch size, 2 to 4c for 4-inch, 3½ to 5c for 5-inch. The cost of making tile is not the same at all factories, hence the reason for the variation in prices. Variable costs of transporsation also affect prices.

Ditches three feet deep and large enough to take the smaller sizes of tiles, cost in the neighborhood of 30c per rod, for excavating the trench and laying the tile. To this must be added the cost of the tile and backfilling of the trench. Where a plow or scraper is used to back-fill, the cost is about 3c per rod for a ditch three feet deep. Hand filling this same ditch would cost practically twice as much. The prices are proportionately higher for larger and deeper ditches.

There is no longer any doubt as to the profits accruing from the tile drainage of land. Often the benefits derived will increase the crops sufficiently to pay for the drainage in a single season. It will require rarely more than three or four seasons in any instance for the increase in yield to pay for the total cost of drainage. After this there will be a constant annual income. Drains properly laid out will last for an almost indefinite period. Certain drainage systems laid out 50 years ago are in excellent condition today. Any farmer who is in doubt about the profits of drainage should note the results obtained by other farmers who have tiled their farms. This should convince him of the practicability of tile drainage.

Pasture

There is room for a good deal of skill and judgment in the management of pastures during the grazing season. The welfare of the live stock is, no doubt, the prime consideration, but that of the pasture land is not of much less importance— in fact, the former is best served by proper attention to the latter.

Both over and under stocking are injurious to pastures. If there is too much stock, the herbage is kept too close, and suffers much from drought, and the animals do not get enough to eat. But too light stocking is worse for the land. It gives the stock the chance to pick and choose, with the result that they neglect the less desirable grasses, which run up, seed, and increase at the expense of the finer and more nutritious herbage. No one can tell, without experience of his land, how heavily it needs to be stocked, whilst the nature of the season also plays an important part. The ideal is just enough stock to graze the land evenly, and to eat it almost bare twice during the season. As in practice we can hardly ever attain the ideal, the tendency should be towards heavy stocking rather than the reverse. If there should come a period of drought it is always possible to help out the pastures with extra green food, though it is remarkable how well stock do in the scanty grass at such times.

It is good for both stock and pasture to change the stock round from one field to another at fairly frequent intervals. Continuous grazing is very bad. If the grass is cropped off as fast as it grows, it is greatly checked, and does not supply such a full bite as it would if given a chance to get ahead a bit now and then. The best plan is to stock a field for three or four weeks, and then give it about a fortnight's rest. At the end of that time there will be plenty of grass, and the stock will return eagerly to the fresh surface.

There is benefit also from change of the class of stock. They do not graze in the same way. Cattle take the longer grasses and cannot graze very low down. Sheep, on the contrary bite very low, and find plenty of keep on a pasture after cattle have done with it. They should therefore follow cattle, never precede them. Horses, also, may follow other stock. They are the very worst of grazers, as may easily be seen from a pasture which is grazed by horses only. We have such a pasture under observation. The horses always dung in the same parts of the field, and do not graze there, so that the grass grows rank and long. In other parts they can bite right down to the ground, having incisors in both upper and lower jaw. The pasture is therefore rank in some parts and thin and bare in others.

The spreading of droppings on the pasture is commonly advocated, but very few farmers can afford the time.

The men are always wanted elsewhere. But it is no doubt highly beneficial to the land if it can be managed. Rank grasses spring up around droppings, and are not relished by stock, so that they seed and increase. Spreading stops this, and manures the pasture evenly.

Unless there is natural shelter from trees in a pasture, much benefit to the stock results from the erection of a rough shed, in which they can shelter from flies in the heat of the day. In this may be placed a lump of rock salt, in a small rack, as this has a healthy influence on the stock. There should be an adequate supply of water in every pasture. It must be supplied if there is no natural service.

EMBER.

Feeding Plants

Plants, like animals, feed. They do not chew their food like most animals but drink it and take it from the air. There are ten essential elements of plant food. They are obtained by the plant from the following sources: Carbon comes from the air; hydrogen and orygen from water; phosphorus, nitrogen, potash, sulphur, calcium, iron and magnesium from the soil. The elements that concern us most are nitrogen, phosphorus and potash. These are the ones that are likely to be lacking in the soil and are purchased in the market in various forms.

The very fact that plants drink their foods makes it necessary to furnish it in solution. It is common to speak of available plant food, meaning the elements of fertility in the soil are soluble in water. They are made so by organic acids which are produced from the decomposition or rotting of vegetable matter, like roots, stems, leaves, etc. When the soil is deficient in these materials, fermentation and decay do not take place and the plant food is not made soluble, hence the plants are not fed properly. Furthermore, if the soil is lacking in an one of the elements it furnishes, it means decrease in crop production.

HORTICULTURE.

San Jose Scale Inspection in Nova Scotia.

During the past year (1912) a fairly careful inspection was made of the 1910, '11, and '12 plantings of fruit trees in the Annapolis Valley for San Jose Scale. This inspection was the result of the discovery of this serious pest early in the season by Mr. G. E. Sanders, Expert, Division of Entomology, Ottawa. Through the kindnets of Dr. C. Gordon Hewitt, Dominion Entomologist, Mr. Sanders took charge of the field work and a very careful inspection was made of the more resent plantings. A summary of the results of this inspection shows that some 150,000 trees were examined and out of this number 723 were destroyed on account of the presence of living San Jose Scale. Though all these trees had been supposedly fumigated with hydrocyanic acid gas, a very poisonous gas, before shipment from the nurseries, yet a comparatively large number bore living scales On hundreds ol the trees the scale was present but on close inspection was found to be dead. The inspectors report that from 25 per cent. to 30 per cent. of the trees recently imported bore San Jose Scale, either living or dead. On account of this high percentage and of the danger from the presence of this very serious fruit pest it has been decided to make a very thorough second inspection of the entire fruit belt during the coming season (1913). Other portions of the province will also be inspected as far as time permits. Any person who suspects that his orchard is infested with this pest should send portions of the infested branches to the provincial Entomologist, Truro, N. S.

The object of this second inspection is to eradicate this pest if it is at all possible. Stringent measures have been adopted already to prevent the further importation of this pest into the province. If we can locate and destroy all the San Jose Scale infested trees in the province there is no reason why we cannot eliminate this pest for all future time. It is a difficult task but is worthy of our best efforts. Of course, in the future constant vigilance will have to be exercised in order that this pest may not again be brought into the province.

During the coming summer inspectors will visit all the orchards in the fruit belt so far as possible and may I not ask the hearty co-operation of every fruit grower in this work? The inspectors will be required to secure certain information regarding the origin of the young trees, whether spraying is practiced or not, area of orchard, and a few other points which will be of value in making a general survey of the situation. This data will form the basis of future recommendations in regard to this work and the accuracy, completeness, etc., of this information will depend upon the hearty co-operation of every fruit grower. The fruit growing industry of this province is one of our basic industries and every bit of information gained will undoubtedly prove of value in its future development. It certainly will prove of great value in the study of the problems confronting the provincial entomologist. Your hearty co-operation is earne?tly requested and I have no doubt it will be given freely.—Robert Matheson, Provincial Entomologist, Truro, N. S.

Discovery of New Fruit Disease.

At a meeting of the National Fruit and Cider Institute at Long Ashton, near Bristol, held on April 25th, the discovery of a new fruit disease was reported, likely to be of great interest and value to fruit growers, and the result of research work carried on at the institute, which is connected with the University of Bristol. Fruit growers are probably familiar with the discolouration and blackening of pear blossom and foliage which is generally to be noticed every spring. This damage is regarded as the work of frost or cold wind. It is not. The trouble has been traced at Long Ashton to be due to bacillus, and a fortunate discovery it is, because now that the origin of this injury is known, it will not be long before Professor Barker and his staff will be ready with an antidote. The organism responsible for the disease has been isolated in the laboratories of the institute, and experiments with pure cultures of the bacteria have proved that the organism is the real source of the trouble. The disease is not limited to pears only. The bacteria have also been found in the institute plantations attacking apples and plums, and producing very similar damage. The result of the attack is that the fruits wither and die off, so that a considerable percentage of the crop is lost. Specimens of similarly-attacked pear blossoms have already been obtined from diffetent parts of the country, and in these cases also the organism has been found to be present. There is, therefore, no doubt that it is widely spread in the fruit-growing districts, and that it must cause very considerable loss to fruit growers. The life histry and characters of the bacillus are being examined, and in due course a full report of the disease will be published. During the course of the year experiments will be carried on to endeavour to find a method of dealing with the pest.

The particulars referred to in the above report will likely be of considerable interest not only to Canadian fruit growers but also to those who are carrying on experimental work at various points throughout Canada.—E. D. Arnaud, Bristol, Eng.

Cheap Apples Very Dear.

Up in New York State—in many near by States and even over our Northern border are great miles of perfectly good apples. Down at this end of the State there are likewise plenty of good apples yet, while the orchardist has far more than he and his pigs and his chickens and his other live stock can possibly use; down in New York's great city there are thousands of little people whose very health will be seriously injured during the growing years and in many cases for all time, because the means of their natural providers are too limited to permit them to furnish to their little ones, the most valuable of all fruit juices which the apple contains. Up in the orchards stand veritable hills of apples going to waste, because the food speculators offer in many cases but ten cents a bushel, and at this price the orchardist finds that he will have to lose even a portion of the price paid for barrels. He would lose the cost of the labor in putting them into the barrels; he would lose all it costs him to haul them to the station; he would lose the cost of picking the apples; the cost of the spraying and pruning necessary to get his crop—the interest on the original cost of the trees and their care until they came into bearing. He would also lose the interest on the acerage occupied and if chemical fertilizers, lime or manure were applied to fertilize them, he would lose the cost of those. As a result he is forced to let his apples rot, in spite of the fact that by so doing he is making a propagating bed for all sorts of bugs and blight which injure the apples. He is furthermore attracting various wild creatures which is the reverse of valuable in any orchard.

Down in the city, apples that have been sorted out from the orchardist's barrel and laid to one side as seconds or culls are selling at fifteen cents a quart, four to the quart—that is, the consumer is asked five cents more for a quart than the orchardist is offered for a bushel—(or thirty-two times as many) and elsewhere, those but a trifle larger are being sold at five cents and ten cents apiece or twenty-five to thirty cents a quart—two or three times as much as the orchardist was offered for thirty-two times as many. No one need be a deep student of economics to recognize the fact that there is absolutely no reason for an addition of two or three thousand per cent between producer and consumer.

The reason which the speculator craftily caused to be laid before both the producer and consumer is a very well organized campaign of misleading publicity, was that the railroads far reaching and exceedingly injurious were responsible. This resulted in a persecution of the railroads in the Uoited States. It went far beyond any possible meaning of the word "investigation," but it proved conclusively that the cost of transportation from producer to consumer was a percentage so small that it could only enter into calculation if placed in the fifth or sixth point in decimals. Then the same speculative distributors of false statements said that the farmers and orchardists of the country were amassing immense fortunes; were buying luxuries of Romanesque quality and receiving the lion's share of the consumer's dollar. The public woke up again and demanded investigation of this fable and they got it. And again was another false statement wiped off the slate. There was but one point left to investigate, which was the real and only root of the high cost of living evil (discovered by us in 1906 and respectfully submitted to the general public) began to receive distinguished consideration of the long-suffering producing and consuming public. The moated and buttress braced fortress of the speculative middlemen was found to be the sole cause of the soaring increase in the cost of living.

Up beyond the big lakes the same thing has been found to be the unnecessary root of the absolutely needless calamity, for it is found that a big percentage of the apple crop of Ontario is rotting, yet apples are selling three for ten cents and these were of the worthless family of Ben Davis at that. As the editor of the Ontario Agricultural College Review says "The life history of these three for ten apples would be of deep interest to the consumer particularly—bought by some shrewd buyer at a figure equal to or less than the cost of production—sold to the city speculator—sold again to a brother speculator and after adding several more 'minor commissions' finally reach the 'end of their journey" and are offered to the consumer with innumerable unearned speculative products and other unnecessary costs" and in practically the same words we have used so many times, our neighbor over the Northern border says:—"Greater production of farm products is not the prime necessity at the present time, but the elimination of the excessive number of grafting middlemen and the establishment of a more direct route from the farm to the city consumer." We find that our contention for the past six years is based on the firmest foundations and it is up to the great big general public, composed mainly of consumers, to get together as an organized army, consolidate the many earnest, hard-working small organizations, societies and associations, which are after all but merely scouts and forlorn hopes—demand wide open producers and consumers city markets and plenty of them absolutely closed to the handful of speculators now manipulating every variety of food consumed by city people and the price of living will promptly recede to the old time figures. For the producer is getting less today for the majority of food items than he was when the cost of living was anywhere from three hundred to three per cent lower than at the present day.—L. I. Agronomist.

Editor's Note.—We were favored with a visit by Sec. Ells of the N. S. F. A. some time ago. He was on his round of visits to the various Maritime Province towns, introducing to the retail grocers and fruit dealers, the business principles of the United Fruit Companies Ltd., of Nova Scotia. Their plan will to a great extent eliminate the great array of middle men and will be the means of ultimately getting the fruit direct from the producer to consumer as it will be possible to get it where quantities of a million packages are concerned. The work that is being done by the United Fruit Companies will ultimately result in better prices for the producers and cheaper prices for the consumers.

The extremely warm weather ten days ago, followed by the cold snap of last week, with touches of frost, will put the Ontario fruit grower in a somewhat anxious mood. Many trees came out in blossom, as it were over night, during the warm spell, only to run up against a cold snap, with will be anxiously watched. The injury, however, will not be anything like as severe as if it came later, when the fruit is set. Then is the time when frost plays havoc with the fruit crop. It may be a good thing too, that the cold snap came along when it did, as it may mean better weather conditions for the fruit later on.—Canadian Farm.

Hand and Garden Tools.

Farmers are all too often neglectful of the importance of having suitable and high quality implements for hand and small garden work. They spend large amounts on big machinery for operations in the field, but cannot see the waste that is going on through their failure to use intensive tools in the small phases of production.

Aside from its purely attractive feature, the home garden can be made, proportionately, one of the most profitable things on the farm, and it requires but a small amount of labor and intelligence to bring truly wonderful results from it. The prime essential is, of course, a variety of good plantings. Almost equal to this, however, is the question of proper tools. Nine farmers out of ten will be amazed at the real saving that can be accomplished in the home economics by having a well kept, properly cultivated garden.

Small hand planters and cultivators, wheel and one horse ploughs, seeders, ridgers and rakes, hoes, spades and all the other appliances for this kind of work should be of highest quality—it will be found to pay in the end. And the amount of labor that can be avoided, as well as the number of operations that can be simplified and made easier is really wonderful.

One of the most complete and highest grade line of small hand and garden tools on the market is that made by the Bateman-Wilkinson Company, Limited, of Toronto. In this will be found every implement necessary for small, intensive tillage—the profitable handling of the small space. Every farmer should become acquainted with these tools, and should send for the series of illustrated booklets published by the makers. These booklets are free. They can be had by addressing a request to Bateman—Wilkinson Company, Limited, Toronto, Canada.

To Women Who Dread Motherhood

Information How They May Give Birth to Happy, Healthy, Children Absolutely Without Fear of Pain—SENT FREE.

No woman need any longer dread the pains of childbirth. Dr. J. H. Dye devoted his life to relieving the sorrows of women. He has proven that the pain at childbirth need no longer be feared by woman and we will gladly tell you how it may be done absolutely free of charge. Send your name and address to Dr. J. H. Dye Medical Institute, Canadian branch, Dept. 110 St. Mary's, Ont., and we will send you, postpaid, his wonderful book which tells how to give birth to happy, healthy children, absolutely without fear of pain, also how to become a mother. Do not delay but write TO-DAY.

The Tent Caterpillar.

The Division of Entomology of the Experimental Farms Branch of the Dominion Department of Agriculture, Ottawa, has recently issued a circular on "Tent Caterpillars," by Mr. J. M. Swaine, Assistant Entomologist for Forest Insects, in the Division of Entomology.

This publication discusses the defoliating Tent caterpillars which were so extremely numerous in parts of eastern Canada during the season of 1912. A description is given of the different stages of the insects, and their life histories and habits are discussed n considerable detail. The American Tent Caterpillar constructs the large silken tents in May and June, so well known by all owners of fruit trees, and from these retreats the caterpillars emerge to feed upon the nearby foliage. This species is found most commonly in orchards, although it also infests various shade trees. The Forest Tent Caterpillar spins no tent, but feeds in groups of several scores upon the foliage, and rests at intervals massed upon the trunk or lower branches. This species feeds chiefly upon deciduous forest trees, such as poplar and birch. Both these species were very abundant last season, particularly in Quebec Province, and their ring-like masses of eggs are to be seen in immense numbers upon the twigs of fruit trees and deciduous shade trees and forests in many districts. The circular referred to above gives a very complete account of the measures to be adopted in controlling these important insect enemies. They are briefly: The removal and destruction of egg masses, spraying infested trees with lead arsenate or Paris green, and banding the trees to prevent reinfestation by wantering caterpillars. Formulae for the spray mixture are given and directions for their preparation. Copies of this publication, Entomological Circular No. 1, Experimental Farms, may be obtained from the Publications Branch, Department of Agriculture, Ottawa.

Improve Pear Trees.

I have practiced spreading Bartlett limbs, which have a habit of growing up in thick, upright clumps, by putting light sticks from one to another This checks upward growth a little, induces the formation of fruit spurs and saves cutting back the long growth next year; also makes a more stocky growth. After these slender growing varieties like Clapp's Favorite, Bartlett and Sheldon come into bearing, it is not necessary to spread them by any such means for the fruit will hold the limbs down. If allowed to grow very slender they will make an ill-shaped tree, when the fruit pulls them down; whereas if kept stocky by spreading they will have a much better thape in later life.—Ira Pease, New York.

One of the ways to reduce the cost of living is to produce much of the living in the garden and the orchard.

Start a stawberry patch for home use if not for the local market. No home should be deprived of the luscious strawberries when they are so easily raised.

Encourage your daughters to plant and cultivate flowers. It will stimulate a love for plants and give the girls a chance to get needed exercise in the open air.

Spring is the season to prune fruit trees. See that the dead and dying branches are removed and take out all superfluous limbs and give the others a better chance.

A liberal supply of barnyard manure is very essential for a good garden unless the soil is naturally very rich.

Amatite ROOFING

It Takes The *Pain* Out Of Painting

IT'S certainly a painful process to keep on painting a roof every two or three years—you feel it in your back and in your pocketbook.

Amatite Roofing never needs painting—sounds almost too good to be true, doesn't it.

Just lay it with an ordinary hammer, and you've solid roof comfort ahead for many years to come.

Costs less than similar roofings of same weight. The mineral surface is also fire-resisting.

Sample showing the pitch waterproofing and real mineral surface free on request.

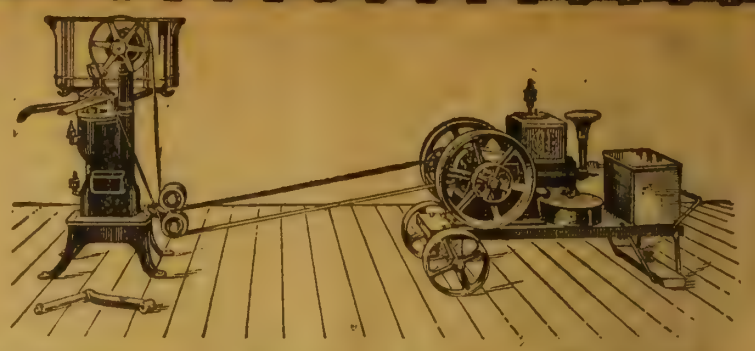
DAIRYING.

Developing the Heifer.

In a recent issue you mention the necessity of using great care in the development of heifers with their first and second calves. I have several very fine Holstein youngsters just coming in. I want to do everything in reason to make big producing cows out of them; as good and better than their dams. Can you give me any general rules to follow for their development? I know, of course, that each animal has peculiar characteristics of its own to which one must cater, but are there not general lines along which one should work? How long should the heifer be kept in milk? How much rest should she get between this and her next calf? How about feed? I have plenty of alfalfa and small grains, also all kinds and varieties of corn; but no silage as yet.—B. D. S.

There are a great many factors that have influence upon the value of a cow as a producer before she reaches maturity, as well as during the time she is actually producing milk. The breeding for generations back of the individual, for example, is an all important factor in determining her value as a dairy cow. Granting that the animal is so bred as to insure a pronounced dairy temperment, the factor of development should receive attention if maximum production is to be expected.

It is a well known fact that capacity is one of the essentials of a good dairy cow and in order to develop this characteristic the calf must be kept growing from the very beginning. A stunted calf will never recover from the handicap. The calf should be induced to begin eating grain and hay at as early a date as possible and there should always be an abundance of the hay accessible. Roughage develops capacity in the digestive organs—an item of importance—as the amount of feed that a cow will consume depends largely on the development of these organs. Heifers should not be bred too young, the age depending upon the breed to which they belong as well as the development of the individual. Holstein heifers should not be bred to freshen before they are 24 months old, as a rule, and a great many would do better if given 26 or 28 months. Heifers should be in good condition at time of freshening, although not fat from an excessive carbohydrate ration. After freshening, they should be worked up to full feed very gradually, receiving all the roughage they care to consume without waste; alfalfa or clover hay fed in



Cream Separator Savings

AN I H C cream separator saves money for you in more ways than most people know. It saves cream because it skims practically all the butter fat out of the milk. It saves on the feed bills. Calves and pigs thrive on the sweet, warm skim milk that comes fresh from the separator. It saves fertility. The dairyman who feeds the skim milk to animals parts with a very small amount of fertility. The man who sells whole milk loses close to $4.80 per cow per year in fertilizing matter. These three savings, while not all that a cream separator makes, are important enough to warrant the most thoughtful consideration.

I H C Cream Separators

Dairymaid and Bluebell

are also furnished as complete power outfits, as illustrated above. The engine is a one-horse power, back geared, hopper-cooled, I H C engine which can be detached and used to run any small machine. The separators are built for long life and skimming efficiency. They have heavy phosphor bronze bushings for bearings; a never-failing splash oiling system; trouble proof bowl spindle bearings; dirt and milk proof spiral gears which are easily accessible for cleaning. There are four convenient sizes of each style. Ask the I H C local agents who handle these machines for demonstration. Get a catalogue and full information from them, or, write the nearest branch house.

What The Dealer Can Show You

GO and see the Standard cream separator at our agents in your locality. It will strike you as being a handsome, compact, convenient-looking machine.

First appearances will delight you. And naturally you'll want to know more about the

Standard

You'll want to know why it has earned the title of "The World's Greatest Separator." Our dealer will be glad to show you.

He will show you the low supply can. You will smile cheerfully when you notice that it is over one foot lower than the supply can on ordinary separators. The high and awkward lifting of a pailful of milk are banished with the Standard.

Then he will get you to step over and turn the crank. You will see right away that you don't have to do any back-breaking stooping. The Standard eliminates that, by having the crank shaft four inches higher than on other separators.

Easy to Clean

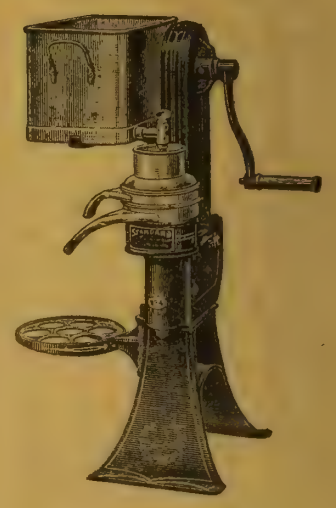
Next he will show you the wide open bowl. You will observe that there are no milk or cream tubes to clog up. And the discs, on a special disc holder, can all be washed in a minute. If your wife is present this feature will make her happy.

And when you are looking at the discs, the dealer will call your attention to the unusually wide open space between the discs and the bowl. This space accomodates the impurities in the milk and prevents the discs getting clogged. It means absolutely clean cream and no waste.

He will next direct your attention to the fact that the only visible moving part of the separator is the crank, the gearing being entirely enclosed, which banishes all danger of the children getting clothes caught or fingers crushed should they venture to touch the machine when it is running.

Self-Oiling System

He will ask if you can find any grease cups or glass lubricators on the machine. You can't because the Standard hasn't any. It's self-oiling system automatically supplies the working parts with a continuous bath of oil. And the oil cannot drip on to the floor and be wasted either.



He will show you—but we've not the space here to tell you all you'll see. But we've got a catalog that describes the Standard very fully. Also a folder entitled "Skimming Results" which gives what we believe are world's records for close skimming accomplished by the Standard. If you cannot conveniently visit the dealer write for this catalog and folder. Of course you'll want them right away, so mail us a card or letter promptly.

connection with silage or roots being a very good combination. The grain should be light in character to begin with and gradually changed to a midture of grains that will supplement the roughage; 300 pounds ground oats, 310 pounds ground corn, 100 pounds wheat bran and 190 pounds gluten feed being a good combination to go with the roughage mentioned above. The grain can be increased a fraction of a pound a day so long as there is an increase in the milk flow, but as soon as there is no response to the increase it must be cut down until there is a falling off in the milk flow and then the increase may be begun again. When on full feed they will be consuming about one pound of grain to every 3½ pounds of milk produced. In the absence of silage or roots, dried beet pulp may be used, but if none of these are available or are to high in price, oil meal can be used in the grain mixture to advantage. In the absence or roots, the cows will consume a large quantity of alfalfa. Sometimes it is advisable to chaff and moisten a part of it when fed under these conditions.

The heifer should be milked up to within six or eight weeks of the time she is to freshen with her second calf, which should be about a year from the time of her first freshening. The method of feeding to pursue while the heifer is dry will depend upon her condition. If she is thin in flesh she should be fed a ration of grain sufficient to put her in good, strong condition before freshening. The grain fed to a dry cow is usually a good investment as it prepares her for the strain of parturition so that she soon recovers and is ready for good hard work at the pail.

Some think it valuable in the development of a heifer to milk her three times a day during the greater part of her first lactation period. Heifers handled in this way often make remarkbly well developed cows when they freshen the second time.

It is also advocated by some that a more pronounced dairy temperament is produced in a cow by breeding her so that she will freshen early. It is necessary to give cows treated in this manner a longer period between their first and second calves, usually 18 months, so that they may have an opportunity for further development. Cows are usually finer boned when handled in this way and very often under size.—Hoard's Dairyman.

Get All the Milk.

Careless milkers do not always get all the milk. It is a dangerous practice to leave the cow incompletely milked, as it not only robs the dairyman of the richest portion of the morning or evening supply, but damages the cow. If the milk is not all taken, so that the udder is completely empty, it tends to lessen her daily supply and shorten her period of lactation. It may require a little more time and patience to secure the last bit of milk from the udder: but this is as important as getting the first part, which comes easy. The cow that is only partly milked will soon be giving less milk. Clean milking does as much as anything to develop the cow into a heavy milker. This is especially true of the young cow or heifer with her first or second calf.

Boys and girls who are in a hurry to get off to school and are required to help with the milking should be cautioned about this fault, as it occurs very frequently with this class of milkers.

SHARPLES
MECHANICAL MILKER

THIS equipment is revolutionizing modern dairy operation. During the four years since its perfection it has been installed with unqualified success in hundreds of the leading dairies throughout America and abroad.

The distinctive features of the SHARPLES MILKER, to which its complete success is due, are the Teat Cups with the Upward Squeeze and the Patent Pulsator operating them. This device reproduces nature's own method of milk extraction, which the most skillful hand-milking cannot do.

The cows are more contented. The teats and udder become far better conditioned. The milk product is absolutely uncontaminated—pure and more valuable. Labor cut to one third.

Sharples Mechanical Milking means the end of all drudgery of milking.

Practically every dairyman can visit installations of SHARPLES MILKERS within easy distance, where the actual operation of this equipment can be observed under conditions approximating his own. We shall be pleased to hear from dairymen with a view to their making such inspections.

OUR comprehensive Mechanical Milker Catalogue is the most important document to the dairyman now current. Forwarded on request.

LIVE STOCK.

The Unfoutunate Pig.

The pig is perhaps the most misjudged of all our domestic animals. Because, for reasons of health he likes to "wallow in the mire," very much on the same principle that a fowl takes a dust bath, large numbers of people seem to think that he really likes to be continually in a state of filth. Because he is omnivorous and will eat of everything, he has all sorts of ill-smelling and unsuitable refuse given him to eat—hog's wash has indeed become a synonym for food that is unappetising in appearance. Though naturally a roamer in the forests, he is generally confined in a small and poky sty, which is badly lighted and affords little comfort; and while he is by nature, a lover of warmth he is kept shivering through the cold weather and suffers to an extent which few people probably realize.

It is well to speak moderately on these matters and to regard them on practical lines. The pig would not be kept at all if he were not a consumer of produce which cannot other wise be put to a profitable use, and he is kept for profit, no great expense can be incurred by pig-keepers to whom a balance on the right side of the leger is an all-important matter. We have, therefore, to consider not what are the ideal conditions for the animal, but what should and can be done under conditions as they exist; and the main text of these notes is that much of mismanagement at present noticeable, while causing the animal discomfort if not suffering, is unprofitable to the owner.

Not a dirty animal.—In the first place the pig is not a dirty animal. It is true that the pig-sty offends the nose, but this is because the open court, which is often a perfect abomination, is not cleaned out frequently and properly. It is, indeed, often so made that it cannot be kept clean and the animal sinks deep into the muck that is allowed to gather round the feeding trough. If we want proof of the cleanliness of the pig, any experienced keeper will tell us that, in proper conditions, the pig will never soil his bedding as so many other animals will do. He will always go as far away from it and from his feeding trough as possible in order to relieve himself, and even little pigs at an early age are not great offenders in this respect.

The pig, given natural conditions, would certainly not be found standing hock deep in foul refuse, or lying on a damp cold floor. On the contrary, he is a lover of warmth and comfort. Let anyone give his pig a good bed of clean straw, and note how he gets into it. covering himself up as far as possible with the litter. Unlike the cow or horse he is not content to lie on his bed merely, but gets into it for warmth's sake, and if several pigs are lying together they will be found huddled close to each other for the same reason. Is it to be wondered at that, kept in the conditions which are so common, they suffer much from troubles caused by dampness, foul air and want of warmth and sunlight?

Rheumatism.—There is no complaint from which pigs suffer more generally than that which is known as "cramp", but which is really a form of rheumatism. The animal is unable to rise, often crawls to the trough to feed, and there can be no dokbt—for he shows it plainly—suffers a good deal. One of the first symptoms of illness in the pig is that he goes "off his feed," and although this is not so pronounced in cases of rheumatism as in other complaints, a slight falling off means loss of flesh, while as he is kept because of his aptitude to fatten, it is obvious that the main purpose of the keeper is defeated. The pig is not a tractable animal to dose with medicine; besides medicine is costly, so that the profit would vanish if much of it were used. Clearly it is less expensive to provide proper bedding and proper flooring to prevent the trouble than to use costly drugs which may fail to cure. Often they are not effectual, while they may have a bad effect on the flesh, and the same may be said also of the rheumatism itself, as feeders have found when, as the saying goes, they have "killed the pig to save its life."

The chief causes of rheumatism in pigs are exposure to wet and cold, want of exercise and improper feeding. The first two are inseparably connected with the housing. A miserable tumble-down place, with irregular floor that cannot be properly drained, is often considered good enough for this comfort-loving animal, and as many people who keep pigs do not grow corn and do not care to buy much straw, the bedding is often woefully insufficient. Overcrowding is common, facilities for exercise are not too good, and even when they are present the need for exercise is not recognized.

Leaky roofs, which admit the rain, foul and close air which affects the lungs and the eyes are common conditions, and these by the way induce another cause of suffering. Pigs, as we have stated, are careful not to soil their bed, and rather than leave their stuffy sleeping quarters to go out into the cold air they retain their water to such an extent that some of the products are re-absorbed and cause illness, sometimes of a serious nature. If, on the other hand they do go out, chills may follow, with the usual consequences.

Another cause of rheumatism is the use of the cold floors of the sty. All these evils are increased when litters are produced just as winter is coming on and the young animals have the most trying season of the year to go through while they are most tender and susceptible. Numerous cases have come under our notice of whole the winter season, and the moral is litters suffering from cramp during comfort to the animal should avoid that those who cannot afford every winter litters if they seek for profit. Profit and comfortable conditions go together.

Perhaps the most merciful treatment for rheumatic pigs is to kill them off, and if they are at all fit for the butcher this is the most profitable course. If treatment is attempted, it is absolutely necessary that they should be made comfortable. Give them a well-bedded, dry sty, a full dose of Epsom salts, and then doses of bicarbonate of potash in the food. The food is best cooked, and should, whenever possible, include a good supply of milk. The swollen limbs ought to be swathed in flannel and rubbed with a liniment such as—spirits of turpentine 2 ozs., liniment of belladonna ½ oz., spirit of hartshorn 1½ oz., olive oil 2 oz. A lot of trouble to take with a pig? Yes, it is—it is much cheaper and better to make them comfortable from the start and prevent ailments.

Swine Fever.—Pig-keepers have been suffering much loss lately from the restrictions due to swine fever. It ought not to be forgotten that insanitary conditions which affect the health of the animals make them more likely to take any infectious illness that may be "about," and it cannot be too often repeated that nothing is so unprofitable to the owner than bad housing of stock of any kind.

The Sty.—If a man is going to build accommodation for pigs we strongly advise him to proceed on a definite plan—to have a sty or sties

SUFFERED FROM

Catarrh of the Stomach For Thirty Years.

Catarrh of the Stomach is generally caused from some interference with the action of the liver, and is a malady that affects the whole body.

Some symptoms are burning pain in the stomach, constant vomiting, abnormal thirst, incessant reaching, etc. On the first signs of any of these symptoms Milburn's Laxa-Liver Pills should be taken. They are a specific for all disorders arising from wrong action of the liver.

Mr. Michael Miller, Ellerslie, Alta., writes:—"I take pleasure in writing you concerning the great value I have received by using Milburn's Laxa-Liver Pills, for catarrh of the stomach, with which I have been a sufferer for thirty years. I used four vials and they completely cured me."

Price, 25 cents a vial, 5 vials for $1.00, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Imperial Waste & Metal Co., 3 Queen St., Montreal

opening on to a small court where the animals can take occasional exercise, on a site that can be well drained. But many a man has to make the best use of what he has or can afford only a rough building. Yet there are many things that even he can attend to without heavy expense. First, make ample provision for drainage, see that the floor can be kept dry, that the sleeping place is not too small so that it will be stuffy, and yet is not draughty and cold; and that a good wooden stage on which the bedding is placed is provided. A handy man can quickly run up a suitable stage which should be removable, and, in default of anything better, old railway sleepers, which can often be obtained very cheaply, may be used. The pig-sty should face south whenever possible. How far sunlight and warmth are of value is shown by a report made by one of our leading breeders, who states that when awarding prizes offered by a local authority he found that "in nearly every case where the pigs were thriving and apparently profitable the stiles faced the south." Could any thing show more plainly the connection between comfort and profit? What ever the floor is made of, and concrete and glazed bricks are well spoken of, it should be so arranged that there are no puddles, and there should be a gentle slope towards the front of the sty.

A cruel practice.—The pig, as has been stated, is not a tractable animal to dose. The work can be best carried out, in the case of liquid medicines, after the animal has been secured—not an easy task—by giving it to bite an old shoe or boot with the toe opened out, and pouring the medicine into this. The harder the animal bites the more likely is the medicine to be swallowed. Sticky medicines may also be plastered among the teeth, and drugs may some times be introduced into the food. But we must protest most strongly against the practice, as a most foolish and cruel one, of pouring liquid medicines into the nostrils of the pig. It is a barbarous thing to do, and yet it is sometimes recommended by those who ought to know better.

Food.—The primary cause of many internal complaints is the fermentation set up in the hog tub, into which refuse, often quite unsuitable for food may be thrown, and in which refuse that may originally be suitable changes its character. It is difficult to avoid trouble of this kind, but there is need of some correction of the idea that anything, however offensive, may be safely fed to pigs, for many cases of serious illness have been traced to the hog tub. One warning is specially called for—to beware of the presence of salt and soda in the wash. Both, in anything like large quantities, are poisonous to pigs, and this fact is not to be set aside because some one has given his pigs a little of either and found that no harm resulted. The "wash" in use in many places receives the remains on the dinner plates, on each of which there is probably some salt, the contents of the washing-up pans, and other kitchen liquors in which soda and salt have been used, and the amount that may unwittingly be given to the pigs in this way is sufficient to cause not only illness and suffering, but even death.

Calf Should be Raised in Barn.

CALF SHOULD BE RAISED in Barn

I have read adverse criticisms to the bringing up of calves the first year on pasture, where they can have grass and skimmilk. Kindly let me know what you would recommend, either calves first year brought up in barn, or allowed to run in pasture by themselves, where they could get both grass and plenty of skimmilk.

When calves are born in the spring, it is better to keep them housed during the summer than to turn them out to grass to fight the flies and to withstand the hot rays of the sun. Calves raised in a clean, shaded barn will do much better. At a very early

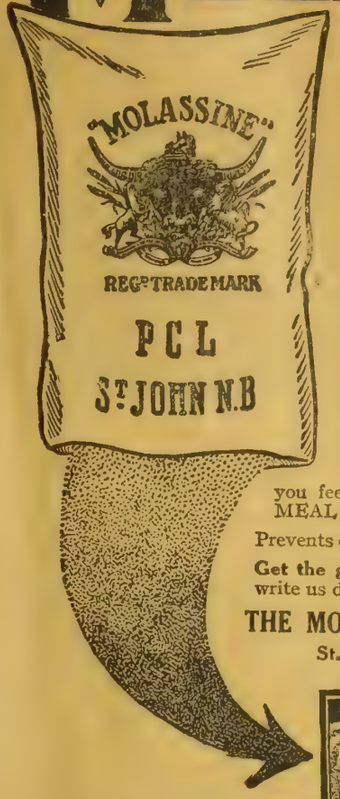
MOLASSINE MEAL



Watch a horse when he is eating his oats—note how he slobbers—bolts a lot—and spills a lot—also a large proportion is undigested.

Take a couple of handfuls of MOLASSINE MEAL and mix with the oats at the next feeding time—reducing the oats by the amount of MOLASSINE MEAL added—then watch him eat—note how he masticates each mouthful and with what evident enjoyment.

Every particle of nutriment is obtained from **all** its feed—that's why it will cost you less for feed and you get better work out of your horses, if you feed them regularly with Genuine MOLASSINE MEAL (Made in England).

Prevents colic and eradicates worms.

Get the genuine made in England. Ask your dealer, or write us direct for full information.

THE HORSE.

Unnecessary Harness.

From many fragments of the architecture of the early ages, and first allusions to the horse as a domesticated animal, it is obvious that nothing superflous in the way of saddlery and harness was employed, and on Grecian bas-reliefs, and friezes horses are represented as being ridden without bit, bridle, saddle or stirrups, the animals being trained to obey the indications of the hand and leg, while the attachements for draught to the chariots used in war and sport were of the simplest character. As time went on however, superflous and injurious po tions of harness were introduced, the weight of metal furniture increased and more attention was paid to appearance than utility.

IN CARRIAGE AND TRAP.

This has continued down to the present times, and in spite of the protests of those who have made the welfare of the horse a specialty, and the example of a few enlightened owners who have realized the advantage of lightness and simplicity in harness, there still persists the idea that certain portions, such as the bearing and hame rein and the winker bridle, even if unnecessary and useless, give the horse a more finished appearance, and when dispensed with, a naked look. In other terms fashion or custom out-weigh consideration for the comfort, well-being and effective working of the horse.

Horses who bore, or who have become vicious through ill-treatment or bad breaking, may require the use of the bearing rein acting on the bit, to make them hold their heads up to the desired height, for when a horse keep his head too low down there is difficulty and danger, but surely this is no excuse for applying the contrivance to good horses, animals that are well bred, in good condition, and full of courage, when it admittedly operates to their disadvantage in working, and to their discomfit as well as the causing of pain. Admitting that there may be in afew special cases an advantage to be derived from the use, that is, the moderate use, of the bearing rein, there is, and can be no necessity for using a bearing rein so tight as to cramp the muscles of the neck, so tight that the head is drawn down with the nose to the breast, and only the slighest movement ftom right to left or vice versa possible.

A well-bred, well-fed, and well-driven horse does not require a bearing rein to hold up his head, nor is the appearance and action of such animals improved by tight reining. That a bearing rein should be used at all on a horse of this class points to some defect in the condition of the horse, the efficiency of the coachman, or in the common sense or humanity of the owner.

DRAUGHT HORSES.

In the case of the heavy draught horse, the hame-rein is as much abused as is the bearing-rein where the lighter bred horse is concerned, and unless under quite exceptional circumstances there is no more occasion for its use, yet the large majority of carters and waggoners, believe—honestly believe—it to be quite impossible to control, or even keep on his feet a heavy draught horse without a hame-rein and blinkers; and there are still many owners who tacitly agree to the theory, which is altogether wrong. "Nimrod's" admission that horses with free heads have an advantage in their working against hills, is especially applicable to the horse required to shift and draw very heavy loads. With the head unnaturally elevated and confined the animal is not in so good a position to put forth his full strength, whether in drawing a heavy load on the flat or in breasting a hill. This is often recognized by the carter himself, who lets down his horses heads at the foot of the hill they have to negotiate with a stiff load behind them, though he may still insist on retaining the hampering appliance. Hame-reins like bearing-reins can certainly be dispensed with on horses that naturally carry their heads well, and yet practically all alike are compelled to wear them, and to suffer the same disabilities as regards restraint in putting forth full strength, and in many cases actual pain, because the hame-rein forms an integral part of the orthodox carthorse harness.

It is sometimes asserted that the use of the bearing and hame-reins prevents the horse from going down when a stumble has been made, but

Horsemen Attention!!

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevents the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

After Using

Use this preparation thoroughly for alland every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR :--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly rccommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

DEAR SIR :--I have used Dr. J Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

OUR Stallion Policies, covering against loss by **Death through Accident or Disease,** are more liberal and afford more protection to owners than any issued by Competing Company. They contain no vexatious clauses, having been drafted to cover **the special conditions** met with in this Country. They cover the horse no matter **where he might be** and not merely **in his own stable,** as certain Companies do. This is very important during the Breeding Season as the horse might die while being on the road. Do not **take any chances** by insuring with others, **insure with us;** The insurance premium represents only a small proportion of the service fees earned. Better risk the **loss of the premium** than the **purchase price** of your beast if it dies without insurance.

Better have and not need than need and not have.

FARMER ADS BRING RESULTS

the fact is that they, by so tightly confining the head and neck prevent many a stumbler from recovering himself as he would have done had his head been free. Looked at from any point of view, and admitting that there may be need for bearing and hame-reins for some horses carrying their heads badly or going with their nose to the ground, there can certainly be none for horses who naturally carry their heads well—that is, much in the same position in which a judiciously applied rein would place them. As for those who use horses with their heads "beared" up to an elevation suggestive of the giraffe, such abuse should be made a penal offence, and any plea of unintentional cruelty scouted.

With reference to the use of blinkers, the "winker bridle" is, where harness horses are concerned, so general that its necessity is rarely questioned, and yet there are many horse owners, mainly railway companies, large carrying firms, and horse-owning municipalities, who have discarded the use of the blinkers with that of the hame-rein. Their horses are used in large towns, where the traffic is congested, and with all sorts of strange and uncanny loads behind them, and they go just as well and as steadily as horses who wear them. This shows that blinkers are not necessary, and in many cases the "open" bridle might be adopted with advantage on the score of economy in construction, lightness, and freedom of ment. Probably all horses, including heavy horses of phlegmatic temperavision, and especially in the case of the spirited and highly nervous, can be broken to harness in the blinkerless or "open" bridle, and work as well without blinkers as with them. In some cases there may be an element of danger in discontinuing their use suddenly, where horses have become accustomed to their use, and the change should be made with a little care and caution. The difficulty, however, is much less than one is apt to imagine, as after all it is natural to the horse to run without blinkers, and when not at work, in stable yard or field, he does not carry them, so the experience of being without them is not really a new one to him.

Some of the blinkers on the bridles of cart horses are unnecessarily large for any purpose and so markedly increase the weight as to constitute quite an addition to the load the horse has to carry. This is an evil that should always be rectified, even in those cases where it may not be considered safe to dispense with the appendages altogether. Lightness and simplicity, with which it is perfectly possible to combine strength and durability, should be the object aimed at in all harness, and there is a considerable waste of muscular power or energy when an unfortunate animal is made to carry a heavy load of metal furniture for which there is no use, or when portions of harness are worn that are more ornamental than useful, and can easily, and often with advantage, be dispensed with.

THE COLLAR.

The collar should always be as light as is consistent with the nature of the work, and all unnecessary ornamentation and heavy housings should be abolished. It is possible to dispense with the collar and occasionally the breast strap is substituted—in some countries it is employed to the exclusion of collars—and experience goes to show that although it is useful in certain cases, as where the collar has caused sore shoulders, horses generally are more liable to gall in a breast harness than in a light,

POULTRY.

A Bill Entitled An Act to Encourage Poultry Breeding by the Formation of the Nova Scotia Poultry Association.

Be it enacted by the Governor, Council, and Assembly, as follows—

1. The following persons and their succetsors duly appointed are hereby constituted a body corporate under the name of the Nova Scotia Poultry Association.

(1) Delegates or representative members, who shall be chosen as follows:—

(a) one delegate or representative member from each Poultry Club in the Province having a membership of fifty members or less and one additional representative or delegate for each additional fifty members of such Poultry Club duly organized under the Nova Scotia Poultry Association;

(b) ordinary members, who shall be elected in such manner and hold membership on such terms as are provided by the By-laws of the Association.

2. The Secretary for Agriculture, the Principal of the Agricultural College and the Superintendent of the Poultry Department at the Agricultural College shall be, ex officio members of the Association and shall, whenever practicable, attend the various meetings and shall assist in promoting the objects of the Association, but shall not have the right to vote at any such meetings.

3. The special objects of the Association shall be;

(a) to enable poultry breeders and those interested in poultry to confer together for the interchange of information with a view to united action in matters relating to the progress and welfare of poultry and pet stock breeding in the Province.

(b) to encourage the holding of Poulty and Pet Stock shows in various parts of the Province.

4. The affairs of the Association shall be managed by an Executive Committee of such number and with such officers as are fixed by the By-laws of the Association. The Secretary for Agriculture, the Principal of the Agricultural College and the Superintendent of the Poultry Department at the Agricultural College shall be ex officio members of the Executive Committee but shall not vote at any of its meetings.

5. No By-Law of the Association or amendment thereof shall have any effect until the same has been transmitted to and received the sanction of the Governor-in-Council.

6. The Association shall hold meetings at such time and places as are fixed by the Association or the Executive Committee and such other meetings as they find necessary or expedient.

7. The Association may, subject to the approval of the Serretary for Agriculture, organize in any city, town, county, municipal district, or such other locality as may be approved by the Secretary for Agriculture, a branch club to be known as "The Poultry Club" for the purpose of assisting and co-operating with the Association in carrying out its purposes.

8. The Association may, subject to the approval of the Governor-in-Council, make rules and regulations for the organization and for the direction of the work of such Poultry Club.

9. The Association or its Executive Committee shall annually submit to the Secretary for Agriculture, for publication in the Annual Report for the Secretary for Agriculture, a report of its proceedings during the year and a statement of its receipts and expenditures.

10. The Governor-in-Council may annually grant for the use of the Association such amount as is found necessary for the purposes thereof not exceeding in any one year two thousand dollars.

11. (1) Out of this grant the Association may use an amount not exceeding $100.00 to be used to defray part of the expenses of meetings of this Association or of the Executive Committee of the Association.

(2) The balance may be paid upon recommendation of the Executive Committee of the Association to Poultry Clubs organized by the Association for the purpose of assisting such clubs to hold local Poultry shows or to carry on such other work as may be approved by the Provincial Association for purposes of promoting the poultry industry.

(3) The grants which may be allotted to a Poultry Club or Clubs in any one country shall be two-thirds of the prize money paid at a Poultry Show or Shows held by a club or Clubs or expended in carrying on work approved by the Provincial Association within the county. But in no case shall the appropriation in any one county exceed one hundred dollars.

(4) Where only one club exists in a county the total appropriation for the County shall be available for the use of that club. Where more than one club exists in a country the grant shall be divided upon a basis of prize money actually paid out or expenditures actually incurred in carrying on work approved by the Provincial Association.

12. The council of any city, town or municipality, in which a branch club has been organized, may notwithstanding anything contained in "The Municipal Act" or amendments thereto, vote and pay to any such club a sum of money to be used for the purposes of any poultry show promoted by such club.

13. The Governor-in-Council may expend an additional sum not exceeding five hundred dollars annually, in paying the expenses of judges and instructors at poultry shows, meetings and such other occasions as may be held or arranged for under the provisions of this Act, and also to pay the cost of such equipment and apparatus as the Secretary for Agriculture may deem necessary for promoting the work of the Poultry Association.

Prevention is Better Than Cure.

As a rule, poultry are of a hardy nature, and, consequently, are not delicate until man makes them so.

If properly cared for they will remain strong and vigorous, proof of this being shown in the fact that on all the large farms in care of veterans, sickness is seldom found among the stock.

The nature of the fowls must be studied, and every comfort given. Comfortable houses must be provided. A house should be so constructed that it will be practically an open shed during the summer, and a warm and yet well ventilated house in winter—free from drafts, and safe from the cold winds and stormy weather.

The nearer poultry is kept in a natural state, the more hardy will they be. It was this fact that led to the invention of the scratching shed plan.

There is danger in houses built so tight that scarcely a breath of air can enter. Again, such places are often overcrowded, and the fowls sweat while on the roost at night, a condition that quickly brings on colds. It is safe to say that nearly two-thirds of the cases of roup are due to overcrowding in close, badly ventilated houses.

The effect of the different articles of food, as well as the manner of feeding, must be studied. To feed a diet, during the summer, of corn or other heat-producing foods, is apt to bring on a diseased condition about as quickly as poor housing. Entirely too much corn, and not enough variety—a proper blending of nitrogenous and carbonaceous material—is fed. An exclusive diet of any one grain is harmful, producing diarrhoea, and symptoms closely resembling "cholera". The bowels are the best indication of condition. When the droppings are of a brownish color, capped with white, they denote good health, and it is then certain that the food is agreeable.

The present system of dry feeding is becoming more popular every year. This does away entirely with wet or moist mashes, which are the causes of so many cases of overfat and bowel troubles.

Fowls may not be overfed. They should have only what they will eat up clean. The dry-feeding method, however, allows food to be constantly before the stock in hoppers. Champions of this method claim that fowls will not overfeed when dry material is constantly before them, for they eat of it only by degrees, taking with it draughts of water to wash down the food. This, we believe, should only be allowed with dry mash, and not with whole or cracked grains. In the latter case the amount should be limited to an average of a handful for each fowl in the pen—and scattered among litter so as to induce exercising.

Cleanliness is an important factor in maintaining health. It should be made a rule to daily gather up the droppings, and cover the dropping boards under the roosts with sifted coal ashes or dirt. Plenty of kerosene should be used on the roosts and in the nest boxes, and every spring and fall the interior of the houses should be whitewashed, and several times a year the premises fumigated by burning sulphur. The drinking fountains, too, must be kept clean, and the water never allowed to become stagnant.

Cleanliness will not only keep out disease germs, but will give a fatal blow to the prosperity of the lice. Lice weaken poultry, and in this state the lattes become easy prey to disease.

All droopy, ailing fowls should at once be isolated. For this purpore it is well to have cages built in a separate building. In many cases a few days' quiet will be more effective than medicine. A liver pill given when the fowl is placed alone, will hasten a cure. Should the condition remain unchanged, the dose can be repeated. Green food, such as lawn clippings, lettuce, or other tender greens, will greatly help along the cause.

Slight colds can be effectively treated by giving one-grain quinine pill each night for three nights in succession.

Rare beef, chopped fine, will do wonders in toning up a debilitated fowl. It does not pay to doctor a fowl that is hopelessly ill, or suffering from a contagious disease. The latter are never permanently cured, and will trapsmit their weakness to the offspring.

Prevention means a minding of all the details, it means regularity, it means system, it means comfort; in short, it means foresight.

Young geese are ready for market when the tips of their wings reach the tail, which is when they are about ten weeks of age.

It is claimed that it is much easier to dress a gosling in warm than in cold weather, as the feathers do not set so tight, and in picking them the flesh is not so apt to be torn.

When the fowls are made bloody by fighting, the sores or cuts should be washed with whiskey, and afterwards anointed with a little vaseline. It is also well to beat up a raw egg and add ten to twelve drops of whiskey for each bird. There is danger of canker setting in from neglected cuts made by fighting.

Fowls occasionally suffer from sour crop; that is, when pirked up they vomit a quantity of fluid, and the crop feels soft. For this we know of no better remedy than two teaspoonfuls of sugar and baking soda, in a teacupful of warm water. Give two teaspoonfuls of this once a day, and at the same time supply plenty of grit.

Air blisters often show themselves in young chicks. The skin puffs out and seems like a bladder of wind. It comes on the abdomen, sides, and under the wings and neck. Prick the blisters with a needle to let out the air. Add carbonate of iron, alternated with granulated charcoal, daily in the food. The diet should be oatmeal principally, with plenty of sharp grit within reach.

"The small pigeon-sized eggs are generally the last of a litter," That at one time was a well-established theory, but the introduction of the trap nest has exploded it. On the farm of the writer where trap nests are used, these small eggs were, in a number of tests, immediately followed by normal sized eggs, which went to prove that the pigeon-sized eggs come from some other cause.

The average weight of a hen's eggs run from 15 to 24 ounces per dozen. A weight of 22½ ounces may be taken as fair average for good sized eggs, although a weight of four ounces is not unknown for single specimens.

When scalding poultry for market, it is best to first dry-pick the legs, so that they will not necessarily be placed in the water and change color. Neither the heads nor the feet should touch water. The water ought to be as near boiling point as possible, without boiling.

The way to "plump" a dressed fowl is to dip it for ten seconds in water nearly or qaite boiling hot and then

immediately in cold water. Hang in a cool place until the animal heat is entirely out. Plumping gives the fowl a much more attractive appearance.

A duck is not fully matured until it is about two and a half years old.

The Pekin duck is of Asiatic origin, and was imported to this country from China, thirty or more years ago. Hudgens says a traveller who saw them about the streets of Pekin, mistook them for small white geese at first, but upon finding that they were ducks, was so greatly impressed with their snow-white plumage and noble carriage that he secured some of their eggs. They were brought to Hong kong and hatched, and in due time the birds were shipped in a vessel bound for New York. A number of the ducks died during the long sea voyage, but from the rest has sprung this popular breed that is now met with in nearly every state of the Union.

When the fattening season arrives, according to an experienced goose raiser, keep the fowls shut away from bathing water, and feed barley meal, cornmeal and beef scraps and some chopped celery. Keep them in a subdued light for three or four weeks, when they can be let out for a couple of days to enjoy the use of a pond. Then return to clean quarters, and feed on barley meal, and milk, and chopped celery, for two or three days, letting them go 24 hours before killing.

The causes for sickness among fowls can be traced to lice, filth, no grit, overfat, sour food, leaky roofs, lack of excerise, crowded quarters, cracks in the wall, exposure to hot suns, cold houses in winter, hot houses in summer, irregularity in feeding, damp houses and runs, not enough bulky food, impure drinking water, poorly ventilated houses, exposure to bad weather, and too much heating food in summer.

A "Standard-bred" fowl and a "Purebred" fowl are not necessarily the same. A bird may not be up to the Standard qualificatinns and yet be a purebred. But a Standard-bred is bound to be a purebred. Utility poultry are fowls bred for increased egg and meat production, and while they are pure in blood may be off in markings from a poultry show point of view. No fowl can be a successful utility bird unless it is purebred.—Michael K. Boyer, Hammonton, N. J.

Proper Feed at Moulting Time.

As moulting is a natural function, nature should look after it and see that a fowl is not hurt during this time, but nature acts here as it does elsewhere—tries to put every fowl not properly rationed and kept in a weakened condition in its grave. If you have some early pullets at hand these may moult late this fall, in which case you must keep a lookout for these pullets; feed them strengthening food and not allow them to run wet and draggled, and sniffling with cold, for if you do you may have but a sorry lot of pullets left over for early laying next spring.

Another thing, the fowls should not go into the moult worried with the blood-sucking mites or the big, creeping, worrying, oil-sucking lice; a fowl needs all they take from it to sustain strength through the drain on the system of growing new feathers, and this is far greater than you may think.

Good, vigorous hens should begin to moult in midsummer. This is an excellent time to begin, as it insures them heat and plenty of green food, and if farmers' fowl plenty of insect food we hope during this time. The hens that moult early should by all rights be the winter-laying hens, and will be if treated all right.

During the moulting season you must not expect many eggs. Some hens will lay nearly through this time. Such hens must be well fed on meats and oily food, as often these hens are the ones you find dead under the roosts and from sheer debility because of this drain and a lack of strengthening food. Hens that moult late as a rule do little laying the winter through, if any. Some fanciers declare that hens will moult much earlier in the season if all of the male birds are removed early in the summer.—Ida M. Shepler.

Poultry Notes.

To supply some form of animal food is still a problem to the extensive keeper of many fowls. It is not only the most costly of foods, but the most necessary, and the most unsatisfactory at the present time. Fresh ground bone from the slaughter houses and butcher shops furnish animal matter in acceptable form, but it must be fed quickly, and even then in hot weather is likely to cause trouble. Its supply being limited, poultry raisers at a distance cannot get it.

The commercial beef scraps, so generally used, are the refuse from slaughter houses, and are generally cured by the acid treatment. Some brands lately analyzed show from 10 to 12 per cent acid. This is as much to blame as ptomaine poisoning for the evil results that frequently arise from the use of commercial beef scrap. The high quality beef scraps are today the cheapest forms in which to purchase protein. Fish scrap would also be a cheap source of protein for poultry of its danger of tainting could be eliminated. Granulated dried milk, running as high as 25 and 30 per cent protein, is being used by some poultry raisers with the best of results. Some form of protein is neccessary if you would get best results with poultry.—Tribune Farmer.

It does not pay to send fowls to market in poor condition; they neither sell readily nor at best price, and often the dealers must lose by them. Fowls that are poor should be fattened before going on the market; they should be put in rather close pens and fed not less than four times a day, and nothing is better to feed than ground corn or cornmeal, the latter preferred, mixed with water or milk. They must be given all they want of this each feed; they must be penned in a quiet place, with nothing to excite them, and, with the mash, must have access to plenty of water and grit. Two weeks is long enough to fatten; a longer time than from ten to fourteen days in close confinement tends to make them restless, after which they lose flesh instead of gain. The chickens that go in the fattening pens must be in good health and free from lice. You cannot fatten fowls that are droopy or lousy. Charcoal in the water tones up the system of fattening birds; a little epsom salts in the water occasionally keeps the bowels in order and enables them to consume more food.—Poultry Culture.

Discard Poultry.

If there are good reasons for reducing poultry stock, the following is recommended: Reduce by discarding all inferior, unthrifty and aged specimens. Dispose of surplus male birds. These eat food and give no return; they also occupy space which should be occupied by profit-making pullets. Keep one breed and specialize; breed none but good ones for the purpose in view—not more than two, one for egg production, the other for table-bird breeding.

An Unsolicited Testimonial

A CLEAR-EYED young farmer stepped up to a manure spreader demonstrator at the 1912 Chicago Live Stock Exposition and, pointing to one of the spreaders in the exhibit said:

"I own one of those machines. It is the strongest spreader I ever had on my farm, and I've had a number of different machines. I honestly believe that if I filled that spreader with soft coal it would spread the stuff for me. I wouldn't trade it for any spreader I ever owned or saw."

This unsolicited recommendation from a man who had used an I H C spreader, and therefore knew what it would do, carried weight with his hearers. They might have doubted whether an I H C manure spreader would spread soft coal—but there was no doubt in their minds that an I H C spreader had spread manure to this man's entire satisfaction. This is a typical case showing what users think about

I H C Manure Spreaders

Corn King and Cloverleaf

I H C manure spreaders are made in many sizes, running from small, narrow machines for orchard and vineyard spreading to machines of capacity for large farms. They are made with either endless or reverse aprons as you prefer.

The rear axle is placed well under the box, where it carries over 70 per cent of the load, insuring plenty of tractive power at all times. Beaters are of large diameter to prevent winding. The teeth that cut and pulverize the manure are square and chisel pointed. The apron drive controls the load, insuring even spreading whether the machine is working up or down hill, or on the level. I H C spreaders have a rear axle differential, enabling them to spread evenly when turning corners.

The local agents handling these machines will show you all their good points, and will help you decide on the one that will do your work best. Get literature and full information from them, or, write the nearest branch house.

Cut Your Work in Two

By starting in to use a large capacity

Waterloo Boy Cream Separator

The favorite everywhere it goes. Note the heavy compact construction, with low down handy supply can.

The 900 lb. size Waterloo when at speed and skimming takes no more power than the ordinary 500 lb. size separator of other makes.

The large capacity Waterloo hand separator will save you time, labor and expense, because it will cut the labor of skimming the milk more than in two, not only because it turns easier than most other hand separators, regardless of capacity, but because it does the work in half the time.

In these busy days, when labor is so scarce and so expensive and so unsatisfactory, a saving in time is a great direct saving in money to you.

Please write us a post card to-day asking for Free book describing this cream separator.

The Sussex Motor Co., Ltd.,

SUSSEX, N. B.

We have for sale a few second hand machines of other makes that we have taken in exchange for our Waterloo Boy. Come in and see them.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

(Continued from last issue.)

"You are such a comfortable man, you see," said Minnie. "You take things so easy."

"No use taking 'em otherwise, my dear," said Mr. Omer.

"No indeed," returned his daughter. "We are all pretty gay here, thank Heaven! Ain't we father?"

"I hope so, my dear," said Mr. Omer. "As I have got my breath now, I think I'll measure this young scholar. Would you walk into the shop, Master Copperfield?"

I preceded Mr. Omer, in compliance with his request; and after showing me a roll of cloth, which he said was extra super; and too good mourning for anything short of parents, he took my various dimensions, and put them down in a book. While he was recording them he called my attention to his stock in trade, and to certain fashions which he said had "just come up," and to certain other fashions which he said had "just gone out."

"And by that sort of thing we very often lose a little mint of money," said Mr. Omer. "But fashions are like human beings. They come in, nobody knows when, why, or how; and they go out, nobody knows when, why, or how. Everything is like life, in my opinion, if you look at it in that point of view."

I was too sorrowful to discuss the question, which would probably have been beyond me under any circumstances; and Mr. Omer took me back into the parlor, breathing with some difficulty on the way.

He then called down a little break-neck range of steps behind a door: "Bring up that tea and bread and butter!" which, alter a time, during which I sat looking about me and thinking, and listening to the stitching in the room and the tune that was being hammered across the yard, appeared on a tray, and turned out to be for me.

"I have been acquainted with you," said Mr. Omer, after watching me for some minutes, during which I had not made much impression on the breakfast, for the black things destroyed my appetite, "I have been acquainted with you a long time, my young friend."

"Have you, sir?"

"All your life," said Mr. Omer. I may say before it. I knew your father before you. He was five foot nine and a half, and he lays in five and twenty foot of ground."

"Rat—tat-tat, Rat—tat-tat, Rat—tat-tat," across the yard.

"He lays in five and twenty foot of ground, if he lays in a fraction," said Mr. Omer, pleasantly. "It was either his request, or her direction, I forgot which."

"Do you know how my little brother is, sir?" I enquired.

Mr. Omer skook his head.

"Rat—tat-tat, Rat—tat-tat, Rat—tat-tat."

"He is in his mother's arms," said he.

"Oh, poor little fellow! Is he dead?"

"Don't mind it more than you can help," said Mr. Omer. "Yes. The baby's dead."

My wounds broke out afresh at this intelligence. I left the scarcely tasted breakfast, and went and rested my head on another table in a corner of the little room, whith Minnie hastily cleared, lest I should spot the mourning that was lying there with my tears. She was a pretty good-natured girl, and put my hair away from my eyes with a soft kind touch; but she was very cheerful at having nearly finished her work, and being in good time, and was so different from me!

Presently the tune left off, and a good-looking young fellow came across the yard into the room. He had a hammer in his hand, and his mouth was full of little nails, which he was obliged to take out before he could speak.

"Well, Joram!" said Mr. Omer. "How do you get on?"

"All right," said Joram. "Done sir."

Minnie coloured a little, and the other girls smiled at one another.

"What, you were at by candle-light last night, when I was at the club, then, were you?" said Mr. Omer, shutting up one eye.

"Yes," said Joram. "As you said we could make a little trip of it, and go over together, if it was done, Minnie and me—and you."

"Oh! I thought you were going to leave me out altogether," said Mr. Omer, laughing till he coughed.

"—As you was so good as to say that," resumed the young man, "why I turned to with a will, you see. Will you give me your opinion of it?"

"I will," said Mr. Omer, rising. "My dear," and he stopped and turned to me; "would you like to see your—"

"No, father," Minnie interposed.

"I thought it might be agreeable, my dear," said Mr. Omer. "But perhaps you're right."

I can't say how I knew it was my mother's dear, dear coffin that they went to look at. I had never heard one making; I had never seen one that I know of; but it came into my mind what the noise was, while it was going on; and when the young man entered, I am sure that I knew what he was doing.

The work being now finished, the two girls, whose names I had not heard, brushed the shreds and threads from their dresses, and went into the shop to put that to rights, and wait for customers. Minnie stayed behind to fold up what they had made, and pack it in two baskets. This she did upon her knees, humming a lively little tune the while. Joram, who I had no doubt was her lover, came in and stole a kiss from her while she was busy (he didn't appear to mind me, at all), and said her father was gone for the chaise, and he must make haste and get himself ready. Then he went out again; and then she put her thimble and scissors in her pocket, and stuck a needle threaded with black thread neatly in the bosom of her gown, and put on her outer clothing smartly, at a little glass behind the door, in which I saw the reflection of her pleased face.

All this I observed, sitting at the table in the corner with my head leaning on my hands, and my thoughts running on very different things. The chaise soon came round to the front of the shop, and the baskets being put in first, I was put in next, and those three followed. I remember it as a kind of half-chaise cart, half piano-forte van, painted of a sombre colour, and drawn by a black horse with a long tail. There was plenty of room for us all.

I do not think I have ever experienced so strange afeeling in my life (I am wiser now, perhaps) as that of being with them, remembering how they had been employed, and seeing them enjoy the ride. I was not angry with them; I was more afraid of them, as if I were cast away among creatures with whom I had no community of nature. They were very cheerful. The old man sat in front to drive and the two young people sat behind him, and whenever he spoke to them leaned forward, the one on one side of his chubby face and the other on the other, and made a great deal of him. They would have talked to me too, but I held back, and moped in my corner; scared by their love-making and hilarity, though it was far from boisterous, and almost wondering that no judgment came upon them for their hardness of heart.

So, when they stopped to bait the horse, and ate and drank and enjoyed themselves, I could touch nothing that they touched, but kept my fast unbroken. So, when we reached home I dropped out of the chaise behind, as quickly as possible, that I might not be in their company before these solemn windows, looking blindly on me like closed eyes once bright. And oh, how little need I had had to think that would move me to tears when I came back—seeing the window of my mother's room, and next it that which, in the better time, was mine!

I was in Peggotty's arms before I got to the door, and she took me into the house. Her grief burst out when she first saw me; but she controlled it soon, and spoke in whispers and walked softly, as if the dead could be disturbed. She had not been in bed, I found, for a long time. She sat up at night still and watched. As long as her poor dear pretty was above the ground, she said, she would never desert her.

Mr. Murdstone took no heed of me when I went into the parlor, where he was, but sat by the fireside, weeping silently, and pondering in his elbow chair. Miss Murdstone, who was busy at her writing desk,, which was covered with letters and papers, gave me her cdld finger-nails, and asked me, in an iron whisper, if I had been measured for my mourning.

I said: "Yes."

"And your skirts," said Miss Murdstone; "have you brought 'em home?"

"Yes, ma'am. I have brought home all my clothes."

This was all the consolation that her firmness administered to me. I do not doubt that she had a choice pleasure in exhibiting what she called her self-command and her firmness, and her strength of mind, and her common sense, and the whole diabolical catalogue of her unamiable qualities, on such an occasion. She was particularly proud of her turn for business; and she showed it now by reducing everything to pen and ink, and being moved by nothing. All the rest of that day, and from morning to night afterwards, she sat at that desk; scratching composedly with a hard pen, speaking in the same imperturable whisper to everybody; never relaxing a muscle of her face, or softening a tone of her voice, or appearing with an atom of her dress astray.

Her brother took a book sometimes but never read it that I saw. He would open it and look at it as if he were reading, but would remain fkr a whole hour without turning a leaf, and then put it down and walk to and fro in the room. I used to sit with folded hands watching him, and counting his footsteps, hour after hour. He very seldom spoke to her, and never to me. He seemed to be the only restless thing, except the clocks, in the whole motionless house.

In thses days before the funeral, I saw but little of Peggotty, excepting that, in passing up and down stairs, I always found her close to the room where my mother and the baby lay, and except that she came to me every night, and sat by my bed's head while I went to sleep. A day or two before the burial—I think it was a day or two before, but I am conscious of confusion in my mind about that heavy time, with nothing to mark its progress—she took me into the room. I only recollect that underneath some white covering on the bed, with a beautiful cleanliness and

A Windsor Lady's Appeal

To all women' I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Uterine and Ovarian Tumors or growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write teday. Address Mrs. M. Summers, Box H. 309 Windsor, Ont.

FREE ADVICE TO SICK WOMEN

Thousands Have Been Helped By Common Sense Suggestions.

Women suffering from any form of female ills are invited to communicate promptly with the woman's private correspondence department of the Lydia E. Pinkham Medicine Co., Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence. A woman can freely talk of her private illness to a woman; thus has been established a confidential correspondence which has extended over many years and which has never been broken. Never have they published a testimonial or used a letter without the written consent of the writer, and never has the Company allowed these confidential letters to get out of their possession, as the hundreds of thousands of them in their files will attest.

Out of the vast volume of experience which they have to draw from, it is more than possible that they possess the very knowledge needed in your case. Nothing is asked in return except your good will, and their advice has helped thousands. Surely any woman, rich or poor, should be glad to take advantage of this generous offer of assistance. Address Lydia E. Pinkham Medicine Co., (confidential) Lynn, Mass.

Every woman ought to have Lydia E. Pinkham's 80-page Text Book. It is not a book for general distribution, as it is too expensive. It is free and only obtainable by mail. Write for it today.

freshness all around it, there seemed to me to lie embodied the solemn stillness that was in the house; and that when she would have turned the cover gently back, I cried: "Oh no! oh no!" and held her hand.

If the funeral had been yesterday, I could not recollect it better. The very air of the best parlor, when I went in at the door, the bright condition of the fire, the shining of the wine in the decanters, the patterns of the glasses and plates, the faint sweet smell of cake, the odor of Miss Murdstone's dress, and our black clothes. Mr. Chillip is in the room and comes to see me.

"And how is Master David?" he says, kindly.

I cannot te l him very well. I give him my hand, which he holds in his.

"Dear me!" says Mr. Chillip, meekly smiling, with something shining in his eye. "Our little friends grow up around us. They grow out of our knowledge, ma'am?"

This is to Miss Murdstone, who makes no reply.

"There is a great improvement, ma'am?" said Mr. Chillip.

Miss Murdstone merely answers with a frown and a formal bend; Mr. Chillip, discomfited, goes into a corner, keeping me with him, and opens his mouth no more.

I remark this, because I remark everything that happens, not because I care about myself, or have done since I came home. And now the bell begins to sound, and Mr. Omer and another come to make us ready. As Peggotty was wont to tell me long long ago, the followers of my father to the same grave were made ready in the same room.

There are Mr. Murdstone, our neighbor Mr. Grayper, Mr. Chillip, and I. When we go out to the door, the bearers and their load are in the garden; and they move before us down the path, and past the elms, and through the gate, and into the churchyard, where I have so often heard the birds sing on a summer morning. We stand around the grave. The day seems different to me from every other day, and the light not of the same colour—of a sadder color. Now there is a solemn hush, which we have brought from home with what is resting on the mould; and while we stand bare-headed, I hear the voice of the clergyman, sounding remote in the open air, and yet distinct and plain, saying: "I am the Resurrection and the Life, saith the Lord!" Then I hear sobs; and, standing apart among the lookerson, I see that good and faithful servant, whom of all the people whom of all the people on earth I love the best, and unto my childish heart is certain that the Lord will one day say: "Well done."

There are many faces that I know, among the little crowd; faces that I knew in church, when mine was always wondering there; faces that first saw my mother, when she came to the village in her youthful bloom. I do not mind them—I mind nothing but my grief—and yet I see and know them all; and even in the background, far away, see Minnie looking on, and her eye glancing on her sweetheart, who is near her.

It is over, and the earth is filled in, and we turn to come away. Before us stands our house, so pretty and unchanged, so linked in my mind with the young idea of what is gone, that all my sorrow has been nothing to the sorrow it calls forth. But they take me on; and Mr. Chillip talks to me; and when we get home, put some water to my lips; and when I ask his leave to go up to my room, dismisses me with the gentleness of a woman.

All this, I say, is yesterday's event. Events of later date have floated from me to the shore where all for-

MANUFACTURERS

MONEY IN POTATOES

$48.00 per acre

OR

$128.00 per acre

WHICH?

When it comes to a difference of $80 an acre on a potato crop, let us take off our hats to the Potato experts.

They can show a practical farmer how to turn an average crop of 120 bushels per acre into a bumper crop of 240 bushels. Simply changing a few old methods of potato growing does it. In this day of high prices, that means $128.00 per acre clear profit instead of $48.00—a difference of $80.00.

The big profit is on the extra bushels because the first cost remains the same.

How experts worked it out through years of experimenting is told in simple words in our little book "Money in Potatoes." A book full of sound ideas—no theory. Every difficulty you could have in potato growing is dealt with.

With this book to refer to you can double your potato crop. Send in the $80.00 coupon for a free copy to-day.

fotten things will reappear, but this stands like a high rock in the ocean.

I knew that Peggotty would come to me in my room. The Sabbath stillness of the time (the day was so like Sunday! I have forgotten that) was suited to us both. She sat down by my side upon my little bed; and holding my hand, and sometimes putting it to her lips, and sometimes smoothing it with hers, as she might have comforted my little brother, told me, in her way, all that she had to tell concerning what had happened.

"She was never well," said Peggotty, "for a long time. She was uncertain in her mind, and not happy. When her baby was born, I thought at first she would get better, but she was more delicate, and sunk a little every day. She used to like to sit alone before her baby came, and then she cried; but afterwards she used to sing to it—so soft, that I once thought, when I heard her, it was like a voice up in the air, that was rising away.

"I think she got to be more timid, and more frightened-like, of late; and that a hard word was like a blow to her. But she was always the same to me. She never changed to her foolish Peggotty, didn't my sweet girl."

Continued in next issue.)

House Cleaning.

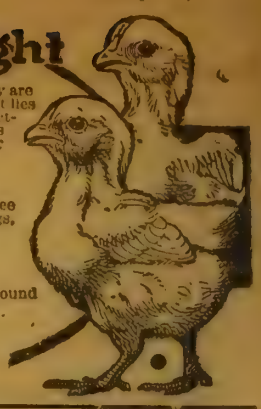
House-cleaning, like Thanksgiving day, is one of the good instituions which belong to this side of the sea. It is understood in Great Britain (that paradise of the housewife) where the maid always wears her cap and never refuses to blacken the boots, that house-cleaning goes on quietly and inobtrusively all the year round, without any one being the wiser. One room is "done" at a time and where there are many rooms, one room cleaned every fortnight or month means that the whole house is thoroughly gone over in a year.

People do say, however, that even in the paradise of the housewife, it is much more difficult to get maids than it used to be. Any of our readers who have crossed the sea in recent years will probably have heard that remark more than once. And even with perfectly organized household machinery, one is not ashamed to confess to a certain satisafction and interest, if not a fearful joy in the catalysm known as "Spring cleaning" when all the household goods of the Farmer's wife are ranged in a row in the out-of-doors and the farmer seeks the seclusion of the barn, if indeed, he does not carry a lunch with him, having arranged to work on the "back hundred" on that auspicious occasion. How his wife's back does ache that night, to be sure, and her sleep is the sleep of the weary, for there are few days even in the life of a farmer's wife, when a bigger day's work is done than at the time of Spring Cleaning.

It is not only inside the house but the accumulations of the winter in the front yard, the rubbish accidently or purposely deposited there, and everything else unsightly or untidy disappears under the besom of spring cleaning.

It is essential to "plan" the campaign of spring cleaning, and to try to do it all in one day, as some too energetic women do. No matter if the house is small, it is a mistake to do two days' work in one, and then have to go to bed for four days. Usually it is better to begin at the top of the house, or at the kitchen, or perhaps at the spare room, and then this particular place may be a haven of rest while the remainder of the house is being cleaned. The dining room and the parlor are the best places to leave to the end, one of the other rooms being used as a dining room for that one day.

Feed Growing Chicks Right



They must be furnished with the right kind of material if they are to make satisfactory growth of muscle, bone and feather. Profit lies in quick growth and early maturity. Rush those cockerels to marketable size and turn them into cash before prices fall. Get the pullets completely developed and ready to fill the nests with fall and winter eggs.

Pratts Baby Chick Food

contains just the necessary ingredients to give them during the first three weeks the best possible start, at a cost of 1c per chick. In boxes and bags, 25c, 50c, $1 up. After the third week mix

Pratts Poultry Regulator

in the ration to aid digestion and make the greatest gain for every pound of feed consumed. 25c, 50c, $1. 25-lb. Pail, $2.50.

"Your money back if it fails."

FREE TO MEN

You Yourself Can Restore Your Vitality

VITALITY is the greatest power in the world. If I renew your VITAL VIGOR I restore you to full and complete manhood. No matter what your age, whether you are young or elderly, no matter what early indiscretion may have sapped your courage. If I resupply you with new VITALITY I give you the strength that all healthy, vigorous men possess. I know the source of this VITAL SUPPLY. My HEALTH BELT, with suspensory attachment, pours a great stream of VITALITY into your system hour after hour all night while you sleep. Thousands have said it immediately benefits and takes the pain and weakness out of the back from one night's use. No drugs, no medicines, no restrictions of any sort excepting that all dissipation must cease. The man who indulges an excesses and unnatural practices can never be other than a weakling, but if you promise me as man to man that you will be decent, take ordinary care of your health and then use my HEATH BELT every night for 60 to 90 days, I should then be able to do in your case exactly what all these other thousands of men have said I did for them. Please write for my booklet to-day. Never mind about purchasing a Health Belt now; first get into communication with me, read what my book says, then later, if we decide between us that you should have a Belt and if you decide that you want to use it, I will arrange for you to have one to wear until you are cured. My Health Belt is the greatest vitalizer the world has ever known. With special attachments it is a remedy for kidney, liver, stomach, bladder disorders, rheumatism. etc.

Let Me Send You THIS BOOK Free

Fill in the coupon; let me send you at once my free booklet in plain sealed envelope; it is profusely illustrated with half-tone photos; keep it in your pocket for easy reference; read the chapter on Vitality; read the chapter on Debility; read the chapter on those subjects which interest every man. young or old, who would be strong in manly vigour. It is a word of hope, a carefully written, interesting booklet which should be in every one's possession. Therefore, send to-day. If in or near the city, call at my office. Hours 9 to 6

Dr. de Van's Female Pills

A reliable French regulator; never fails. These pills are exceedingly powerful in regulating the generative portion of the female system. Refuse all cheap imitations. **Dr. de Van's** are sold at $5 a box, or three for $10. Mailed to any address. **The Scobell Drug Co., St. Catharines, Ont.**

Do not begin more work than you can finish in one day. Secure help from somewhere. Simplify the usual household routine when house cleaning is "on." It is always a pity to have a room in confusion over night, and no sensible person will think of cooking an elaborate dinner and house cleaning too, any more than she will, on the other hand, rush to the other extreme and almost altogether omit the regular meals.

Remove from the room all the movable furniture, rugs, pictures, hangings, curtains, beds, books, etc., etc., and have all of these thoroughly cleaned outside the room. It is not a bad plan to engage someone to wash all the pictures, for example, in the house, and have these neatly arranged in piles, the pictures from each room in a separate pile, all ready to hang in their own places again as soon as the room is clean. If there are some good boys and girls on the farm, housecleaning will be eased by everyone's helping to get such jobs done in the evening, and this shortens the labor and trouble of house cleaning very much.

The wife and mother should as far as possible direct others and plan the work and not exhaust herself by doing anything that she can get some one else to do for her. This is most important. We know that sometimes the farmer's wife is worn out in mind and body by the cruel pressure of work and in a rich and prosperous farming community like ours, this should not be.

The proper time for house cleaning seems to be when it is warm enough to wash the windows and when the "self-feedes" can safely be put out of commission till next winter. This disposes of a great deal of dust and dirt, and the farmer's wife takes heart to look upon her lace curtains and put away heavy winter things.

It is very important not to "raise a dust." Floors should be cleansed, not by dry sweeping, but by first scattering tea leaves or wet newspaper torn into large fragments, or other wet material and so sweeping up the dirt without distributing it all through the house. The Dustless Cleaner may be all very well, but $50.00 is a lot of money and no "Dustless" will give the clean fresh smell of soap and hot water pervading the whole house and making you quite certain that the work is done. "How clean it smells," says everybody.

Bed clothes and bedding should all be exposed to the sun and air. The back verandah is valuable for this, but the lawn is a good place too.

If there has been illness in the house, now is the time to finally banish every germ. Sunlight and fresh air are far and away the best disinfectants and the next best are boiling water and soap. Nothing is as safe, or as satisfactory, as sunlight, soap, and boiling water.

Nature summons us to the spring cleaning by leading the way herself. The rushing river carries down mud and debris. The banners of the spring make us plan for clean or new carpets and curtains. Last year's leaves are thriftily used for new soil material, and so it goes.

Don't let spring cleaning kill you. Save time to see and hear the birds and flowers. Never stay in all day, especially in spring.—Winnifred Cotter in Farmers' Magazine.

When Worry Enters the Home.

With women I suppose that household problems are the greatest single cause of worry. The proper rearing of the boy, the succeesful training of the girl, the usual petty cares of the home, to which all women are subject, together with the modern servant problem—all serve to create anxiety and worry, together with the useless and unnecessary toil connected with the family life. Housewives are constantly worried over the proper performance of little things, that, as an actual fact, would in no way affect the family happiness if they were left undone.

Many a mother, when she wakes up in the morning, begins the day in a state of anxious and nervous agitation; she feels herself already crushed under the weight of all the burdens she will have to bear. The little household cares and domestic trials which every mother has to bear are not to her simple annoyances; they are actual catastrophes, and she suffers every one of these calamities a score of times before they come. By noon her life is swarming with apprehensions, difficulties and troubles; wŏrry reins supreme on the throne of her mind, and distraction has come to possess the soul. At the close of the day this unhappy mother has borne a hundred sorrows which were wholly imaginary, produced entirely by abnormal emotion.

HOW WORRY CAN PRODUCE POOR HEALTH.

Now worry grows by what it feeds on. When we nurse and nourish this spirit of dissatisfaction it acts and reacts upon ourselves until the very soul is filled with discontent and the mind is permeated with complaining. However small and trifling the matter over which we began to worry the insignificant cause of our mental dissatisfaction will be found entirely sufficient to feed and nourish the spirit of uneasiness to the point where it gains possession of our minds, threatens to wreck our careers and constantly harasses the soul to the point where life is unbearable.

Some of these people seem to have actually brought themselves to the place where they enjoy poor health. They would not be happy if they could not complain of headache, backache, stomache, or something of the kind; their complaints have become chronic; they enjoy enlisting the sympathy of their fellows, having delight in describing their sufferings and explaining their miseries; they are constantly consulting the almanac and the patent-medicine advertisements to find some new cause for physical complaint, and they usually find what they are looking for.

There is little doubt that nine-tenths of all the ordinary functional diseases of the body originate in the mind, and it is worry that produces the soil from which these infant diseases spring. The seeds of mental disease and physical affliction may fall upon us thick and fast, but if they fail to find the soil of worry and depression in which to develop and grow we are not likely to be seriously affected by their presence. It requires not only a germ to produce disease, but also favorable soil in which it may grow. Worry produces just that condition of mind and body most favorable to the growth and development of all the vicious diseases which prey upon the mind and destroy the body.

The direct result of worry we know now is diseases, and there is where the crime of the matter comes in. The fact that certain nervous diseases are direcly caused by worry admits of no doubt whatever. Take the general condition known as "neurasthenia", commonly called "nervous prostration." Patients suffering from this condition are usually spoken of as all "run down." The truth is that they are all "wound up", and, as a result of high tension coupled with mental anxiety, they have broken down.—Ladies' Home Journal.

All Skin Diseases ARE OCCASIONED BY BAD BLOOD.

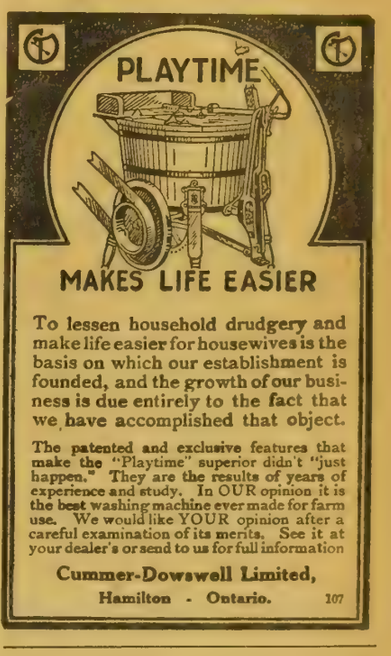
No one can expect to be free from some form or other of skin trouble unless the blood is kept in good shape.

The blood can easily be purified and the skin disease cured by the use of Burdock Blood Bitters, that old and widely known blood medicine.

It has been on the market for over 35 years and its reputation is unrivalled.

Mrs. Lillie Mitchell, Guelph, Ont., writes:—"I was troubled with eczema. My body was covered with awful itching skin eruptions. Although I tried many different remedies I could get nothing to give me relief. Finally I got a bottle of Burdock Blood Bitters, which completely cured me."

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.



MAKES LIFE EASIER

To lessen household drudgery and make life easier for housewives is the basis on which our establishment is founded, and the growth of our business is due entirely to the fact that we have accomplished that object.

The patented and exclusive features that make the "Playtime" superior didn't "just happen." They are the results of years of experience and study. In OUR opinion it is the best washing machine ever made for farm use. We would like YOUR opinion after a careful examination of its merits. See it at your dealer's or send to us for full information

HOW TO CONQUER RHEUMATISM AT YOUR OWN HOME

If you or any of your friends suffer from rheumatism, kidney disorders or excess of uric acid, causing lameness, backache, muscular pains; stiff, painful, swollen joints, pain in the limbs and feet; dimness of sight, itching skin or frequent neuralgic pains, I invite you to send for a generous **Free Trial Treatment** of my well-known, reliable **Chronicure**, with references and full particulars by mail. (This is no C. O. D. scheme.) No matter how many may have failed in your case, let me prove to you, free of cost, that rheumatism can be conquered. **Chronicure** succeeds where all else fails. **Chronicure cleanses the blood and removes the cause.** Also for a weakened, run-down condition of the system, you will find **Chronicure a most satisfactory general tonic that makes you feel that life is worth living.** Please tell your friends of this liberal offer, and **send today** for large free package, to **MRS. M. SUMMERS, Box B. 309—Windsor, Ont.**

FLORICULTURE.

Hampton, writes:—I left a bed of Hollyhocks in the ground last fall as my grandmother used to do. This spring a few are sprouting about the dead stalks, but the others show no signs of life. Would you think they are dead and how can I tell? Is it too early to plant Nasturtiums? Will they grow in a shady place? Will grass grow under heavy trees. The lawn grass I get seem to be ineffective.

Dig about the Hollyhock roots carefully and see if there is any life in the crowns. Yous can easily tell.

Would not advise planting Nasturtiums until after the 15th of May. They are not usually successful in a shady place, as they like sunshine.

Grass seed can certainly be grown under most trees when there is a little sun during the day if the soil is not sour. The common lawn mixture would not thrive. You must have a mixture with Nemaralis and if the soil is suspected to be at all acid, give a light dressing of air slaked lime. Any heavy soil in a shady situation will be found more or less acid.

Dig around the tulips and hard perenials to loosen the winter caked soil. A dressing of good bone meal will help your buds now if well rotted manure or compost is not available.

Roses should be planted as soon as possible after the first of May. The seasons are so short at best for them and the earlier they go into the ground the better. A dozen times a week the florist is asked re the best varieties of Rose to plant. Of course, this is to some extent governed by circumstances but in the writer's experience the Paul Neyron as a pink; Jack or Ulrich Brunner, as a red, with Dickson, as white, seem to give the best results. At all events these sorts have all been thoroughly tested in New Brunswick and have been found reliable.

Plant this spring Delphiniums, Phlox, Columbine and other old-fashioned hardy plants that you thought of last summer. A well drained, sunny bed with good soil will give good results for years. Annuals may be planted between them with good effect if you like a few cuttings such as Asters, Stocks, Mignonette, etc.

If your soil permits, plant your Sweet Peas as early as possible, the earlier the better. Don't make the soil too rich or you will get nothing but vines and little bloom. Poor soil with a little strawy manure to start them and a light top dressing of ashes when they are about six inches high will be found to give the best results.

Unnecessary Harness.

(Continued from page 603)

well-padded, and properly fitted collar. The fitting should receive most careful attention, and the collar should belong to the horse, no matter in what respect the other parts of the harness or cart gears are made interchangeable. It is obvious that all shoulders are not in the same shape, and this also applies to backs where saddles and pads are concerned, so that it is long odds against the collar of one horse fitting another with that accuracy which is essential to the reduction of friction—the chief cause of collar galls—to a minimum. As regards injury to the skin a collar that is too loose, as we often see when that belonging to a large horse is worn by smaller animal, is even worse than one that is too tight, since friction is a more fertile cause of galls than pressure is of sores. Further, when horses do not vary appreciably in the shape of their necks and shoulders, there are differences, for a collar, even a new collar, when it fits has to be made by wear to take the impression of the shoulders falling into depressions and elevations, and these are never quite the same in any two horses.

Besides having its own collar suited as regards its weight to the type of animal and the nature of its work, care should be taken from time to time to have it refitted. The stuffing of a collar, which consists of rye straw, in course of time becomes very hard, and the lining gets worn, when the collar should be "re-plugged" and re-lined.

CART SADDLES.

Cart saddles and pads, in common with collars and other portions of the harness, are often unnecessarily heavy and uselessly ornamented and also, like collars, are often badly fitted. The first rule in the fitting of a saddle, and it applies equally to the cart saddle or harness pad, is that it should bear on the back and ribs, and not on the spine or withers, which will not stand pressure. There is, of course, less difficulty in the fitting of the cart saddle than in the case of the riding saddle, where the weight of the man in the case of a saddle not wide or high enough in the arch tends to bring it down and pinch the wither, but it must be remembered that, particularly in the case of the two-wheeled vehicle—for example, the heavily loaded tip-cart—going down hill, considerable weight is thrown on the back, and by pressing forward a cart saddle that is too narrow, the withers may be pinched, and that dreadfully painful condition koown as fistulous wither established. —Patley Bridge in The Farmyard Series.

Lame back is usually caused by rheumatism of the muscles of the back, for which you will find nothing better than Chamberlain's Liniment. For sale by all dealers.

LOCAL TREATMENT FOR WOMEN'S DISORDERS

The health we enjoy depends very largely upon how the blood circulates in our bodies; in other words, if we have perfect circulation we will have perfect health.

There is a constant wearing out of the tissues in every part of the body. The blood flowing through the veins carries off this waste or dead matter, while the blood coming from the heart through the arteries brings the fresh new living tissue, the essence of the food we have digested, to replace what has been carried off. This constant wearing out and expelling of the dead matter and the replacing of it with new matter, atom by atom, goes on day and night, until in about 7 years a complete change has been effected. Thus every man and woman has an entirely different body in every particle of it from what he or she had 7 years before.

It sometimes happens, however, from a variety of causes, that the blood becomes congested in certain portions of the body. This means that the blood vessels in these parts become weakened, and the circulation in that section of the body becomes sluggish and stagnant. The consequence is that the dead matter in that part of the body is only partially carried away, and that but little of the new, vital matter is introduced there to build up and strengthen the tissues and nerves.

This condition invariably exists in all cases of female disorders. The dead matter retained in the circulation, which should have been expelled, causes irritation and inflammation of the delicate memberane, and oppresses the nerve centres. This condition is the cause of the grievous physical and mental suffering which accompanies female troubles.

To obtain relief it is evident that the first thing to be done is to get rid of the dead matter which is being held in the circulation. If this dead matter is allowed to remain there a species of blood poisoning will result and nature will endeavor to get rid of it by forming ulcers, tumors, etc.

The above explanation will also show why ORANGE LILY is so successful in curing this condition. It is a local treatment, and is applied direct to the affected organs. Its curative elements are absorbed into the congested tissue, and from the very start the dead matter begins to be discharged. A feeling of immense relief, both mental and physical, accompanies it, and the improvement is constant and positive. This feature of the expelling of the dead matter is always present to a greater or less extent, and in some cases it is so marked as to be amazing. The case described in the following letter is not exceptional:

Dr. Coonley—I am thankful to Mrs. F. E. Currah, your Canadian representative, for my health restored by your wonderful remedy. I have suffered for 17 years, but not so bad until 3 years ago. Then I had a doctor, who told me I had a tumor, and could live no more than a year. If I went through an operation I would not live through it. A year later I sent for him again, and he gave me up to die. My husband then sent for another doctor, who performed an operation, and it did me much good. I doctored with him 3 or 4 months, but became so bad again that I thought I could live no longer, and I began to long to die. One day my husband came home and threw a slip of paper to me with Mrs. Currah's address and told me a lady had advised him to write to her for a treatment that would cure me. I said it was too late, that I would die anyway. I could not lift a teacup without hurting me. Then the first doctor told me I was worse than ever. However, my husband sent for ORANGE LILY, and the third treatment brought away one tumor. Others followed, until 7 tumors had been expelled, 3 large ones and 4 small ones. I know if it had not been for ORANGE LILY I would have died, for I could not live much longer. I would have thought it cheap at one hundred dollars for a month's treatment, instead of one dollar. It is worth its weight in gold.—MRS. GEO. LEWIS, Huntsville, Ont.

The above letter is published with Mrs. Lewis' permission. All letters received are treated as being sacredly confidential, but occasionally some patient feels so grateful for being cured that she is willing to make the matter known for the benefit and encouragement of her suffering sisters.

ORANGE LILY is a positive, scientific remedy for all disorders of the female functions. As explained above these troubles are of local origin, and require local treatment. It is just as sensible to take medicine internally for female troubles as it would be to take medicine internally for a bruise, a boil or an ulcerated tooth. In all these cases some dead matter is being retained, and the cure is effected by employing local methods for expelling the dead matter. ORANGE LILY has antiseptic, soothing and healing properties, and also tones up and invigorates blood vessels and nerves. I am so anxious that every suffering woman may satisfy herself, without cost to her, that ORANGE LILY will cure her, that I hereby make the following

FREE TRIAL OFFER

I will send, without charge, to every reader of this notice who suffers in any way from any of the troubles peculiar to women, if she will send me her address, enough of the ORANGE LILY treatment to last her ten days. In many cases this trial treatment is all that is necessary to effect a complete cure, and in every instance it will give very noticeable relief. If you are a sufferer, you owe it to yourself, to your family and to your friends to take advantage of this offer and get cured in the privacy of your home, without doctors' bills or expense of any kind. Address MRS. FRANCES E. CURRAH, Windsor, Ont.

For Sale By Leading Druggists Everywhere

Land Drainage Means Sure Profits.

Land drainage is not mere speculation. It is a problem which can be handled with mathematical exactness and justified from an economic stand point. Too many farmers are prone to look at the matter in a general way, rather than to arrive at conclusioos by careful and accurate calculations.

There are two classes of farm lands which are entirely unproductive, and lands under cultivation producing in some instances an occasional crop. In the first instance the cost of clearing and breaking the land must be added to the cost of drainage, while in the second case only the cost of drainage need be considered.

The success or failure of land drainage depends largely upon a correct location of the drains. Location is of first importance and in this the farmer must be guided to a great extent by a knowledge of local conditions gained through successive seasons of farming. If he has been an observant man, he will have noticed certain places in his fields where there has been partial or total failures of crops due to excessive moisture. He will also have acquainted himself with the direction taken by surface water after rains. Furthermore, he will have noted the points of overflow from ponds, sloughs and swales. Knowledge of this kind is of great importance in subsequent drainage operations, and will frequently eliminate the necessity of running accurate levels over the area. In certain cases where the ground is nearly level, it may be necessary to use an instrument in order to determine the correct location of the drains. On the other hand, if the slopes are well defined, instruments may be dispensed with and the drains laid by merely noting the flow of water in the trench.

The distance apart of the lines of drains will depend mainly upon the character of the soil. It is apparent that a compact, retentive soil will require a closer spacing than an open, porous one. Lowering the depth of the drain will permit a greater spacing of lines. This rule holds good mainly in an open soil. It is frequently a matter of conjecture to know what distance apart the lines should be placed. This requires a through character of the soil, best acquired by a personal study of the area for one or more seasons. The practice has been to place the lines of drains anywhere from 30 to 300 feet apart.

Homeseekers Excursions to Western Canada.

Every Wednesday until the 9th of October the Intercolonial Railway will sell second class, round trip tickets to Winnipeg, Brandon, Regina, Edmonton, Saskatoon and Calgary. These are good to return two months from date of issue and are a special inducement for those wishing a cheap trip to the West. The nearest I. C. R. ticket agent will furnish all particulars. In that ticket read via Intercolonial Railway, the only all Canadian route from the Maritime Provinces.

The financial statement of the Prince Edward Island Central Seed Fair has been published. It shows that the receipts were $735.73, including $385.00 from the Government, two hundred dollars from private citizens, fifty dollars from the City, and forty-eight dollars from Institutes. The expenditure was $727.31, which included $469.65 for prizes, $257.66 for the payment of bills. The Association has therefore a balance on hand of $8.42. —Pioneer.

Look Into This Gate

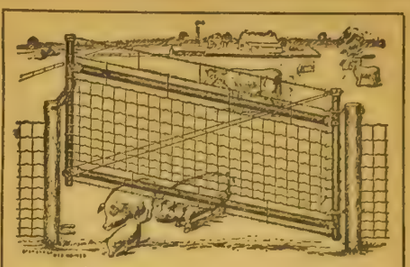
BEFORE you buy any farm gates look into the "Clay" Steel Gate. It has features possessed by no other gate. It is the ideal gate—the very gate that all Farmers want and have wanted always. Consider these good points of "Clay" Gates—:(1) They always hang true—they can't and won't sag, bend, break, burn, blow down, or rot; (2) They can be raised (as shown) to let small stock through or to lift over snow in winter; (3) are so light that a child can work them with ease ; (4) positively keep back breachy cattle.

Clay Steel Farm Gates

will last life-time. They are fully guaranteed. The leading stockmen of Eastern Canada, and the model farms at Guelph, Ottawa, and Macdonald College use Clay Gates, knowing their worth.

Clay Gates are made of tubular steel of large diameter—far stronger than gas pipe or tee or angle iron ; and of heavy wire mesh fabric. They are made in a great variety of sizes and styles—a gate for every purpose.

I GUARANTEE every Clay Gate to be free from defects in material or workmanship. I will replace free any parts, or the entire gate, giving out for such reasons.
H. RALPH STEELE, Manager.



In a recent competition on the subject of "the Ideal Farm Gate" open to the Students of the Ontario Agricultural College, Guelph, every competing student with but one exception declared "Clay" Gates to be the most perfect farm gate made

60 Days' Free Trial

One or a dozen Clay Gates sent for 60 days' free trial in order that they may be tried out before being purchased. 30,000 Clay Gates were sold in 1912 on these terms.

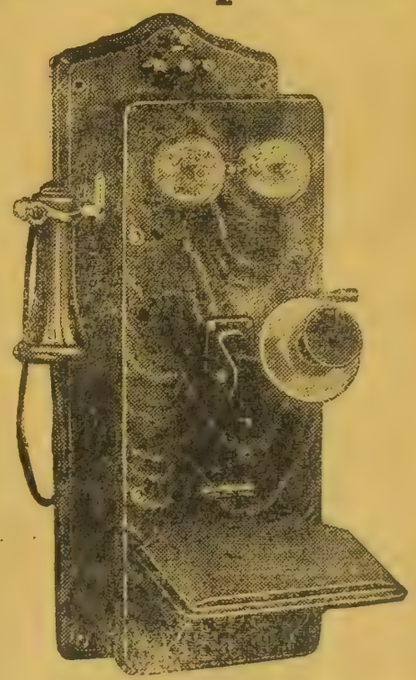
Put The Latest Style Telephones On Your Lines

INCREASE the efficiency of your telephone system by installing the latest style telephones. Canadian Independent Telephones are the highest grade made. We guarantee them to be superior in style, workmanship and material to any others on the market. You can prove this true by trying them out on your own lines, side by side with other phones. This you can do without risking a cent. Just ask us about our Free Trial Offer.



Get Our Advice If your locality does not enjoy the social and business advantages afforded by an up-to-date telephone service it is time you got into communication with us. We are the largest Independent Telephone Manufacturers in Canada, and have been instrumental in seeing that the majority of the independent local and municipal companies have started into telephone business along lines that insure success. We can help you get a telephone line for your locality. Write us and we will tell you how.

The No. 3 Bulletin This is the latest book published on building rural telephone lines. It is complete in every respect. Write for a copy. We will also send you an illustrated description of our desk set, the most up-to-date on the market, and our portable telephone or test set if your are interested.

"Sovereign" Sheathing Felt

Trade Mark Registered

Makes Houses Draft-Proof

SOVEREIGN Sheating Felt is as effective as several layers of ordinary building paper. It is thick, tough and wind-proof, and will prevent even a particle of draft from passing through walls or floor. Being really light-weight RU-BER-OID Roofing, it will last as long as the building.

For every extra cent you spend on SOVEREIGN Sheathing Felt you will save dollars in fuel, and will have a more comfortable home.

Get a sample from the nearest RU-BER-OID dealer, or write for sample and booklet to 106

MARKETS.

Charlottetown

GRAIN.—Oats, White 38c. to 39c.; Black 40c. to 42c.

FEEDSTUFFS.—Bran, $1.15 to $1.25 per 100 lbs.; Shorts, $1.25 to $1.40 per 100 lbs.; Middlings, $1.30 to $1.40 per 100 lbs.; Oil-Cake, $1.90 to $2.00 per bag; Gluten Meal, $1.55 per bag; Corn Meal, $1.60 per bag.

GRASS SEEDS.—Timothy, 6c. to 8c.; Com. Red Clover, 26c.; Mam. Red Clover, 26c. to 28c.; Alsike, 30c.

LIVE STOCK.—Butcher's Cattle, 6c. to 7c.; Stockers, $18.00 to 35.08; Milch Cows, $25.00 to $50.00; Sheep, 4c. to 5c.; Lambs, $3.50 to $5.00.

DRESSED MEATS.—Beef (carcass) 9c. to 12c.; Beef, (retail) 8c. to 16c.; Mutton, 8c. to 14c.; Veal, (carcass) 6c. to 8c.; Pork, 11½ c. for select.

HORSES.—Drafters, $170.00 to $250.00; Roadsters, $170.00 to $250.00; Carriage, $170.00 to $250.00.

DAIRY PRODUCTS.—Creamery Butter, Prints 28c. to 29c., Solids 27c. to 28c.; Dairy Butter, 25c. to 28c.

POULTRY AND POULTRY PRODUCTS.—Eggs, 17½c. to 18c.

FRUIT.—Apples, $4.00 to $5.00 per bbl.

MISCELLANEOUS.—Hay, $11.50 to $13.00; Straw, $6.50 to $7.50; Wool, 25c.; Beef Hides, 11c.; Calf Skins, 14c.; Sheep Skins, 70c. to 90c.; Lamb Skins, 30c. to 40c.

VEGETABLES.—Carrots, 50c. to 70c. bush.; Potatoes, 22c. to 25c.; Turnips, 14c. to 16c.; Beets, 50c.

Farmers are busy planting and market only poorly supplied. Season is cold and backward but dry, and planting is fairly well advanced. Prices for most lines of farm produce are good, but potatoes are low and difficult to sell even at the small prices. Oats are quiet and demand not very brisk. Meats of all kinds are high and Butter is still scarce but lower prices in this line are expected. The cheese season has not opened here as yet but the outlook is for lower prices. Eggs are fairly plentiful and prices hold firm but a slight drop is expected.

Halifax

GRAIN—Oats, 46c to 51c bushel, (bagged); Peas, $2.30 to 2.40 bus.; Barley, $1.70 to 1.75 per 100 lbs.

FEEDSTUFFS.—Bran, $22.00 to 23.00 per ton; Shorts, 23.00 to 24.00 ton; Middlings, 24.00 to 25.00 ton; Oil Cake, $2.25 to 2.30 per 100 lbs.; Linseed Meal, $2.20 to 2.25; Gluten Feed $1.35 to 1.40 per 100 lbs.; Corn Meal, 1.45 to 1.47 per 100 lbs.

GRASS SEEDS.—Timothy, 5½c to 6c lb.; Common Red Clover, 22c to 24c lb.; Mammoth Red Clover, 22c to 24c lb.; Alsike, 21c to 23c lb.

LIVE STOCK——Milch Cows, $30.00 to 50.00; Sheep, 8c to 10c lb.; Lambs, 13c to 15c lb.; Hogs, 9c to 10c lb.

DRESSGD MEATS.—Beef (Carcasses), 8c to 10c lb; Beef (retail) 12c to 24c lb.; Veal, 12c to 15c lb.; Pork, 15c to 18c.

HORSES.—Drafters, $200.00 to 300.00; Roadsters, $200.00 to 250.00; Carriage, 200.00 to 350.00.

Care of the Suckling Colt

There will be a difference of from twenty-five to fifty dollars in the selling prices of horses determined by the management they have received when they were colts. The colt that three or four years ago was allowed to follow its dam to town or church, or to drag its weary limbs back and forth after the mare from one end of the field to the other, from morning till noon and from noon until night, has not developed as it should and sells at anywhere from twenty-five to fifty dollars less than it would have brought had it been properly cared for.

We do not know what the price of horses will be when the sucklings of this year are put upon the market; but whether that be high or low, it will pay to give them Christian treatment. They are young, their bones are soft; and while they like to play and have a good time, they are easily tired out, and hence should not be allowed to follow the mare further than the stable door or the barnyard. She will probably fret and worry about her baby for the first day or two, but the farmer can afford to unhitch her at about ten o'clock, give her a drink of water, let her cool off, supply the wants of her baby and then go back to work.

If the colt is kept in a roomy stall, or, better still, in a paddock, or in a small pasture well fenced, preferably with some other colt or idle horse to keep it company, it will soon be content to stay at home; in fact, will not know that it can go outside of the enclosure in which it is confined, whatever that may be.

After it is three or four weeks old it will begin to get hungry; but a little fresh grass, if there is a pasture convenient, or a little bran, oats, clover or timothy hay, will stay its stomach until feeding time comes. In fact, the well bred colt will always pay a good price for anything that is fit for it to eat. Hence no farmer should stint his suckling colts.

Remember, that in the first year, particularly in the first six months, you are laying the foundation, building the frame work, so to speak, on the lines of architecture you laid out when mating the dam. No matter how well bred the colt, it must be developed. The plan of the architect must be carried out; and this can be done only by proper feeding' shelter and care.

Teach the colt that you are its master—omnipotent so far as it is concerned—whose will cannot be resisted, and yet though powerful are kind, disposed to be friendly, even generous. All this takes a little time and trouble; but it is time that is well spent and trouble that pays.

Valuable Live Stock for P. E. I.

One of the most valuable shipments of live stock ever brought to this province, arrived by the S. S. Empress, April 17th. It consisted of three Clydesdale fillies, one rising two years, and two rising one year old, also a handsome driving mare, four years old. One Shorthorn bull calf and three yearling heifers of the same breed. The whole were selected and purchased in Ontario this winter by Hon. John R. Richards. The Clydesdales are a handsome lot, full of quality and breed of character. The yearlings were sired by the noted breeding horse Gallant Carrauchan, the horse bred in the same lines and closely related to the well known horse, Knight of Argowan, imported from Scotland by Mr. Richards many years ago. These fillies should prove most valuable for breeding purposes. The driving mare is of handsome conformation with style and high action. Her sire is the well known Hackney, Oak Hall, and mare. The bull calf is from the Pure bred standard famous herd of W. A. Dryden, Brooklin, Ont., and is of the Duchess of Lancaster family, a family that has bred splendidly in this country, as it has in Scotland. This is probably the highest priced youngster ever brought to the Island and should do much to improve the Short-horn breed. The heifers are a choice lot and fashionably bred, one being by the noted bull Superb Sultan, at present in the herd of R. Miller, Stouffville, Ont. One is red in color and the others red-roan. These cattle were purchased by Hon. Senator Yeo, and will be a valuable acquisition to his already splendid herd of Short-horns.

Mr. H. H. Acorn, Souris, P. E. I., has purchased from Mr. Dodd Dwyer, Pictou, N. S., the Standard-bred carriage stallion "King Dodds." King Dodds is a magnificent animal, a beautiful bright chestnut in color, standing 15.3 hands high, and weighing 1,135 lbs., and will be seven years of age on June 12th next. In breeding "King Dodds" is the peer of any, being sired by "Kalol" 2.19¼, by "Kremlin" 2.07¾, by "Lou Russell," brother to Maud S., 2.08¼, and his dam was "Marie King," by "May King," 2.21¼, sire of "Bingen," 2.06¼ "Uhlan," 1.59, and many others. As a show horse, "King Dodds" had won fourteen red ribbons at five years of age, and had never been shown anywhere that he had not won first prize, until this year, at Amherst, when, owing to the fact that he was not properly fitted, he had to be content with second place.

The Best Built Roller

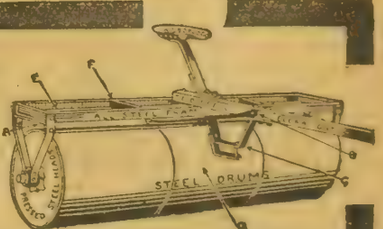
is the "Bissell," with Drums of heavy steel plate, hard in temper, riveted up close, having pressed steel heads.

With AXLES of 2 inch solid steel revolving on cold Rolled Roller Bearings.

With the MALLEABLE CAGE in one piece, holding the Roller Bearings in line on the axle.

With DRAW BRACKET under the Pole, making the Draught down low.

With the FRAME all of steel and the improved steel plate bottom.



You may be told that other Rollers are like the Bissell—but there is only one original Bissell Roller and to save our customers disappointment, we put our name on every Roller we build. Look for the name "Bissell" and write our Dept. M for catalogue.

Several styles and a variety of widths to choose from, 6 ft. up to 12 ft. Grass Seeder Attachment also furnished if required. 73

T. E. BISSELL CO., LTD., ELORA, ONT.

Operations on the Farm.

Of necessity the farmer has to depend on himself very largely in the treatment of his ailing stock. In the first place he is very often far away from a veterinary surgeon, and telephones are not as yet a part of the equipment of the average farm in this country. If he sends for him the veterinary may be miles away in the opposite direction, and possibly hours may elapse before his arrival on the scene of action. Then the value of many of the individual animals of the farm is small, and would soon be swallowed up in doctor's fees, while the profits of farming are not large, anh thus the desire to avoid expense is natural enough. Indeed, the stockman is often an expert in the treatment of minor ailments, and it may be safely said that a really experienced man who loves his stock and knows their peculiarities is the means of saving them from a good deal of suffering. But—and this the crux of the whole matter—this is only true if he knows his own limitations, and refrains from doing things which he is not qualified to do. Unfortunately, there are many people whose ignorance is only equalled by their self-confidence, and who really take upon themselves operations from which a really good stockman would shrink. There is no means of ascertaining how often cruelty of this description is inflicted upon animals, because in many cases, while the pain may be great, the apparent results are not so noticeable as to attract attention, and it is to the advantage of all concerned to say as little about it as possible. But records of cases that have come to light show that farm animals are not infrequently the victims of inexpert, sometimes of barbarous, treatment, and it is well that it should be made clear that those who are guilty, even if their object was not to be cruel, are liable to punishment. Let us deal with a few examples.

DOCKING.

Whether docking is desirable or not is a matter on which there is a good deal of difference of opinion. It is claimed by some well-known breeders to be necessary in the case of fast carriage horses, but this is disputed by equally competent horse-keepers, who scout the notion that there is any danger to be feared from the retention of the whole of the tail. Yet the opposition to a reform in this matter is so strong that when the Royal Agricultural Society passed a resolution some thirteen years ago tending to the discouragement of the exhibition at its shows of docked horses it was practically forced to rescind it without loss of time. The truth is that docking is "fashionable" and that is the explanation of the continuance of the practice. So was ear-cropping of horses at one time, but it has died out, and we may hope that the same fate will soon befall the practice of clipping the tail.

We hold strongly that, save in exceptional cases, docking is an act of cruelty, and this is not merely on account of the operation itself. It is painful, of course, but when carefully performed the result of the wound is not serious, and it heals quickly enough. The cruelty consists in the result of the operation upon the animal's comfort. It is held to be of advantage to dock foals when young, on the ground that the operation is less painful then, and doubtless it is less painful; but when these are turned out in the summer their sufferings are great. The tail is a natural flywhisk, but when it is cut short the animal is deprived of an essential weapon of defence, and is practically powerless against its tiny enemies. This may seem a small matter—it is not so to the horses, and in fact they show there sufferings in loss of condition; they cannot feed in comfart, they cannot rest, and of course they cannot make the desired progress.

But unfortunately the operation is often not performed carefully. We have heard of such barbarous methods as putting the tail across a block of wood and chopping off a portion! This, we are happy to believe, is an exceptional case, but unskilful hands, dirty instruments, and lack of proper treatment of the wound afterwards often result in sloughing of the joints, and of a good deal of torture to the animal. If docking is to be performed at all—and we repeat that in the vast majority of cases there is no need for it—it ought to be done by some one who knows something of surgery, can make the cut in the proper place and quickly, and knows also how to treat the wound afterwards so that it may heal readily. The result of the sloughing is that the tail has to be cut again, and when eventually healed may be so short that the animal is quite disfigured; while the clumsy wounding may result in poisoning the whole system and perhaps in the death of the animal.

TAILING.

The tailing of lambs is on a different footing, for, singular as the custom may appear to outsiders, there are good good grounds for holding that it is of benefit to the sheep, because when the tail is left the wool on the hind quarters is apt to become dirty and to invite the attentions of the "fly," which often causes torture and even death, so that the animal may in the long run suffer a good

BELOW is the big plant of the Waterous Engine Works Co., Limited, manufacturers of Sawmill Machinery, Road Rollers, Engines, etc. These workers in Iron are compelled to by the nature of their business to roof their valuable plant and its contents with the next best thing to an ***imperishable*** roofing. deal more from the presence of the tail than from the sharp cut which removes it. It is a fact that the lamb operated on may generally be seen resuming its feeding as if nothing had happened. But here again the need for clean instruments is imperative, and shepherds would do well to use carbolic disinfectants for their knives, &c., and carbolised oil for the hands in preference to some of the preparations that are so popular owing to the respect paid to a privately owned recipe.

POLL EVIL, FISTULAS AND QUITTOR.

Much of the unnecessary suffering that animals undergo is due to the fact that those in charge of them neglect to get expert advice in time. Take the case of poll evil as an example. This is often due to the low stable entrances which are to be met with. The horse may be able to walk in alright, but some time or other he jerks his head up suddenly and strikes it against the lintel. A lump is caused, and if this is neglected it may develop into a case of poll evil. Or the same result may follow on repeated pressure by a head collar. Now it is of no use whatever poulticing or "dressing" a case of developed poll evil. From the posieion of the injury there is no escape for the "matter" that forms, and if the treatment is not vigorous and prompt it will burrow its way downwards, forming canals or "tubes" until the poor animal is in a pitiable condition. What is wanted in a case of this kind is not the doubtless well meant poultice and ointment but a clean cut with the knife which will lay bare the canals and make an opening for the escape of the pus or matter.

It is work for the surgeon, and it is folly to delay sending for him until the trouble has progressed so greatly as to be come almost impossible to cure it. So difficult indeed are some of the cases that it is safe to say that the average veterinary surgeon would much prefer to be without them. The same thing may be said of fistulous wither and the disease of the coronet called quittor. We have known people dabble about with these things with "dressings" that might just have been applied to the manger for all the good they did to the horse, and in the meantime the trouble has been getting worse and worse and, apart altogether from the prolonged suffering, there is less chance of a cure and the treatment is bound to be prolonged and therefore costly.—The Farmyard Series.

Why Leafy Potato Plants.

The most nutritive part of the potato, the part that gives to the potato its excellent flavor, is the part that contains the greatest number of starch cells. If anyone will cut a potato through the middle he will notice that the potato substance is not homogeneous. Around the outside of the potato, just beneath the skin, is a layer, separated from the inner layers by a vascular sunifibrous partition that is visible on close examination. This outer layer is called the corticel, and contains most of the starch of the potato. The best potatoes have this corticel layer thick instead of thin—that is, have more starch than the others.

The principal chemical element of starch is carbon. The potato plant gets all of its carbon from the air through the leaves, none of it from the soil. The leaves have the power to dissociate the carbon from the car, bon dioxide in the air, and store much of this carbon in the tuber. The larger the leaf capacity and vigor, the more carbon it will be possible for the plant to utilize from the air. If the leaf growth is scanty, or if it is injured and lessened by either insects or disease, the less carbon will the plant be able to take from the air and store in the tuber. This is the reason why a liberal leaf growth in the plant is necessary in order to produce the highest quality in the tuber. It is also the reason why ever grower should protect his plantfrom the ravages of insects.

IHC Wagons Are As Good As They Look

TO really know the value of a wagon you must know of what material it is made, how it is built and about how many years of satisfactory wagon service you may expect. When you know all there is to know about I H C wagons it is safe to say that your next wagon will bear the I H C trademark—the stamp of quality and honest value.

Every piece of wood used in I H C wagons is carefully selected and air-dried. Only in air-dried lumber does wood retain its full strength and elasticity. All steel or iron is selected with the same care to secure the greatest possible strength. Thorough knowledge of the strain each part must stand is necessary because a wagon, like a chain, is no stronger than its weakest part. Every part of I H C wagons

Petrolia Chatham

has the same relative strength. The men who build I H C wagons know why one part is built stronger than another, know the exact strain it will have to bear. This same thorough knowledge has enabled them to build a wagon of light draft, which puts the least strain on the horses, without impairing the strength or durability of the wagon.

The finishing touch, the thing that adds to the life and appearance of an I H C wagon, is pure paint. Cheap paint may improve the appearance of a wagon for a short time, but after that is a positive detriment. Only pure paint is used on I H C wagons. It fills the pores of the wood, prevents shrinking, swelling, warping and twisting, and acts as a wood preservative.

There are many other reasons why I H C wagons are such good wagons, why owners say they are the best and most satisfactory. Have the I H C local agent show you an I H C wagon, or, if you prefer, write the nearest branch house for catalogues.

This label has no "second grade"

THERE'S only one quality of Canada Cement. It is the highest quality that can possibly be made with modern equipment, scientific methods and rigid inspection by expert chemists.

The Canada Cement you buy for a garden walk is the same cement that is sold by the trainload for great dams, elevators and bridges. The engineers in charge of these great works have ample facilities for testing the quality of cement.

Canada Cement

comes up to their most rigid requirements.

The farmer has not these facilities for testing the quality of cement. He must buy a product upon which he can depend for a grade that is *always of highest quality*, and that therefore does not *need* to be tested.

You can place absolute reliance upon the quality of Canada Cement.

It's always the same and always the best. The large output—which enables us to *keep the price down*, enables us also to maintain the factory equipment and organization that *keeps the quality up*.

A Canada Cement label appears on every bag and barrel of genuine Canada Cement. See that it's on the bags and barrels of cement that you buy.

WRITE for our free book "What the Farmer Can Do With Concrete." It has told a hundred thousand Canadian farmers of the money-saving and profit-making possibilities of concrete.

Lower Gagetown, N. B.

Farmer Ads. will Bring Results.

P. E. Island Crop and Live Stock Conditions.

HAY—Clover has saved fairly well throughout the Island, except in some of the hillier parts and in Western Prince, where it has been badly killed. There is no scarcity of hay in any part of the Province, but there is very little for sale, the market price depending entirely upon the quality. In King's County correspondents report the prospects for pasture to be poor, resulting from the dry weather of two years ago. The outlook is for a better than average hay crop.

WHEAT—The usual amount of ground is being prepared for wheat. White Russian seems to be the favorite variety in all parts of the Province, with White Fyfe a close second. About West Devon and Coleman quite a lot of Colorado Bearded is grown. White Chaff is regarded with favor about Bedeque and Freetown. Neither Blue Stem nor Marques seem to be increasing in popularity. Imported wheat is not as generally used as formerly.

OATS—About 164,000 acres are annually seeded to oats. In some sections banner is grown almost exclusively, and in others Old Island Black. It is worthy of notice that the districts in which all kinds of oats are being raised report the lowest price for seed oats, averaging 40c, while those districts in which Old Island Black is reported to be the chief variety give an average price of 50c a bushel for seed, and the Banner oats districts an average price of 60c. Old Island Black predominates in Western Prince and in Eastern King's. Banner in Eastern Prince and in certain districts scattered through Queen's and King's Counties. It is also noticeable that in a few districts which use imported seed oats, the prices quoted are not among the best. Correspondents report a large amount for sale still in the hands of the farmers.

BARLEY—Very little barley is grown in this Province, except as a mixture with oats and peas. Six-rowed barley is becoming more common than formerly, quite a lot of No 21 O. A. C. will be sown this year in Prince Caunty.

POTATOES—There are a good many potatoes yet for sale in all parts of the Province. The demand is very small and the prices reported vary from 15c to 25c per bushel, being better in King's and Southern Queen's than elsewhere. MacIntyres are the popular variety in Prinre County, Dakota Reds in King's and Southern Queen's, while in the remainders of Queen's several varieties claim equal attention. Green Mountains are not growing in popularity.

TURNIPS—Turnips kept particularly well through the winter. The number of silos is not increasing.

LIVE STOCK CONDITIONS.

Live Stock—All clasees of live stock have come through the winter in good condition.

In some sections winter dairying is on the increse, but in others it is declining. The same is true of the quality of milch cows. One correspondent says: "There can be no improvement in the quality of the cattle till they are better fed and cared for." Pigs are very scarce and are bringing about eight dollars a pair for feeding at four weeks of age.

The following are the market prices May 10th, 1913:—

Oats (white)	38 to 40
Oats (black)	40 to 42
Pork	11½
Straw (per ton)	$5.50 to $6.50
Potatoes (per bushel)	20 to 22
Hay (per ton)	$12 to $15
Beef (quarter)	7 to 10
Butter	30 to 32
Eggs (per dozen)	17 to 18
Turnips (per bushel)	15

Calf Should Be Raised in Barn

(Continued from page 611)

age the calves consume very little, if any, grass. The ideal way is to have the calves born in September and October. The first few months of a calf's life it requires considerable personal attention, and during the winter months especially there is more time to devote to the stock than in the busy summer months. When spring comes, the calf is six or seven months old and can be turned to pasture to advantage; it is past the period when it needs very much close attention. If the grass is good, and plenty of water supplied, the calf will largely look after itself.

Get a Start Cheap!

Six Sicilian Buttercups eggs, four Turkeys eggs, (Bronze), five of my best Single Comb Rhode Red eggs, $2.00 for the fifteen.

Four handsome pairs of Sicilian Buttercups $5.00 A pair

Sicilian Buttercups generally agreed among those who breed them to be the best layers known $3.00 for 15 eggs.

Breeder and Importer of

Clydesdale horses of the highest quality and breeding—the stud includes the noted show and breeding horse "Baron Kelvin." Every brood mare is a first prize winner at Scotch and Canadian shows. Driving horses generally on hand. Shetland ponies of the smallest type and best breeding. Polled Angus cattle of the most fashionable strains. Herd won first prize Toronto in 1906 and many other shows. Also small herd of Shorthorns from imported deep milking families.

The "BURLINGTON" English Model. This shows the most popular style of suit worn by well-dressed men in England.

PRICE $12.50

Duty Free and Carriage Paid.

Sign The Coupon

and we'll send you 72 pattern pieces of the finest English Suitings you ever saw

With the patterns will come our 1913 Style Book and a letter telling you all about our successful system of made-to-measure tailoring for Canadians.

We guarantee to prove to you that we can save you from 33 p. c. to 50 p. c. on the purchase of any suit. All you need to do is to sign the coupon and get the patterns and "be shown."

So confident are we that you will be satisfied with the value of our suitings, that we suggest you make this test: When you receive patterns, pick out the one you like best, take it to your local tailor, Say to him:—"What will you charge to make me a first class tailored suit of that quality of material?" Then compare his price with the one we ask, and act on your own judgment. That's fair, isn't it? Mail the coupon now, before you forget it.

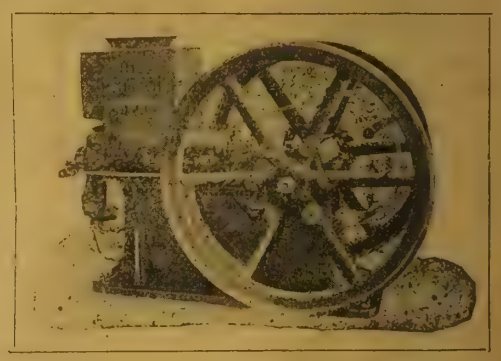
Dept. Maritime Farmer.

USE THIS COUPON NOW

Plan Now to Own This Summer Our "Monarch" Engine --The Very Best Value Money Can Buy.



WE want you to select for your farm a "Monarch" Engine, and the reason why we offer it to you is that we have made it for you as though you had a big engineering staff waiting to test it severely.

We don't make "cheap" engines. The "Monarch" is a farm engine, but made as carefully as an automobile engine in every part. We put into the "Monarch" extra large parts, a carbon-steel piston rod, adjustable bearings, timing and safety devices --qualities and fittings not found in "cheap" engines.

These fittings and materials cost money, and we have to charge you for them, when you buy a "Monarch." But, really, in the end, these devices and the quality-material save you a great deal of money for fuel, a great deal of inconvenience and time, and reduce the chance of breakages to the very lowest point. In addition to this, a "Monarch" will last over a longer period of years on your farm--it costs you less per year than any ordinary farm engine. It costs you less for fuel.

The farm engine is a good thing. Even the poorest of them pays its way in making the farmer less of a slave and drudge. But a perfectly designed farm engine, well made in good material, such as the "Monarch" is the greatest boon in the world for a farm.

In a "Monarch," due to its design, you get these very important things--all these things together in the one "Monarch" purchase--$\frac{1}{4}$ to $\frac{1}{2}$ fuel cost saved over 15 to 20 years; easy starting at all temperatures; great variation in power; easy change of speed; easy shifting or moving without breakage; easy take-up of wear. "Monarchs" give more power than their rating.

We want you to investigate a "Monarch" Engine. We will send our "red circle" folder showing its parts, part by part. Within 2 years the "Monarch" constantly used will have saved its cost by reduced fuel bills. You can get Monarch Engines in sizes from 1 1-2 horse power up to 35 horse power, ready for farm service.

Frost & Wood Binders

REDUCE Harvest Wages-INCREASE Harvest Profits

THIS is the time to make a decision on a binder. The one binder to consider is the famous Frost & Wood. Behind this binder are 75 years of experience in farm implement building.

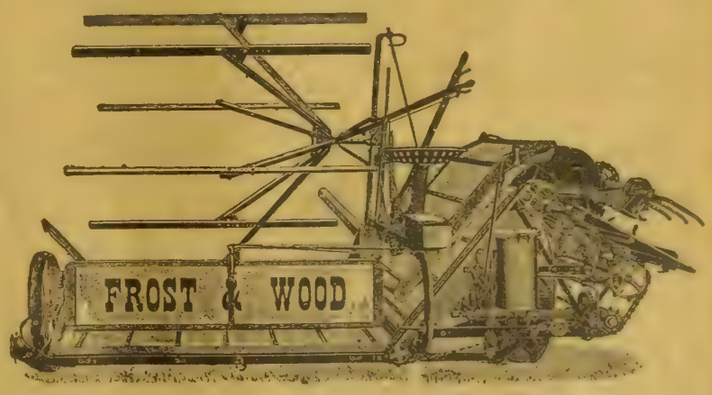
We claim that the Frost & Wood is one of the very best machines a farmer can use, especially if he depends on a single team. The reason is that the "eccentric sprocket" device on the knotter shaft uses the team's strength economically. The extra power needed for tieing the bundle and ejecting it is obtained by leverage, and not by the direct draft of an ordinary binder.

With a Frost & Wood there is no "chug" and slowing down at each sheaf. The horses pull steadily at even speed. In a day's work, a Frost & Wood Binder covers much more ground. The gain is especially great during the afternoon, giving a full day's drying-out to the stooked sheaves. This saves a day or more on each field—saves time, saves harvest wages, saves possible damage from wet weather.

The Frost & Wood Binder has roller bearings throughout. The frame is stiffened and braced at every corner. This means that the light draft of the binder from roller bearings cannot be destroyed by sagging of the frame and twisting of shafts out of line.

Besides saving your Harvest cost, Frost & Wood Binders increase your net profits. Grain does not "thresh" either in the elevator or on the deck. Your wheat, oats or barley all get into the sheaf, and from the sheaf to your barn.

Grain scattered on your field is a serious loss in cash. The Frost & Wood quickly pays for itself by the savings it makes on your farm. Save harvest wages. Save all your crop for your granary. Do it with a Frost & Wood Binder.



SEE a complete description of the Frost & Wood Binder in our illustrated Frost & Wood Farm Implement Book. This binder merits a careful examination and a comparison after examination with any other binder. It will cut quicker, bind better, and wear longer than any ordinary machine. Get this book from us today.

Write us for Catalogue or see the Frost & Wood Agent about any Farm Implement you need, especially if you seek years of perfect service in your machinery.

Note the Color of *your* flour—
And the Bread it makes for you.
Delicately *creamy* is FIVE ROSES flour.
Because it is *not bleached*, don't you see.
Clear—Immaculate—Desirable.
A *pure* Manitoba wheat flour—FIVE ROSES.
And the healthy sun-ripened spring wheat berries are *naturally* of a *golden* glow.
And the meaty *heart* of the polished kernels is *creamy*.
Milled from *this* cream, FIVE ROSES is delicately "creamy."
The only *natural* flour from Manitoba's prime wheat.
Which gets whiter and whiter as you *knead* it.
And *your* bread is most appetizing, *unusually* attractive in appearance.
Looks good.
And *is* good.
Bake this purest *unbleached* flour.

Dustman's Book of Plans *and* Building Construction

By U. M. DUSTMAN, (*Licensed Architect*)

10,000 Sold in 30 Days

Price $2.00 Prepaid

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an authority on the construction of medium priced homes.

Everyone interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns. farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS :

General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying out a building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions For Mixing and Placing Concrete - Proportions—Sand and Gravel—Itamized List of Material Costs—Writing of Specifications.

This book will be sent, together with a year's subscription to THE MARITIME FARMER to any person upon receipt of $2.00. That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscription. If you are not already a subscriber and want the book, you may obtain it and THE MARITIME FARMER for $2.00 These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.

Montreal Halifax St. John Toronto Winnipeg

The Easiest Way To Take In Your Crop

With the BT Sling Unloader you cut in half the work required to harvest your crops. and save *half* the time. Your horses do *all* the hard work. By hitching them to the draft rope you can tighten the Slings about the bundle and hoist it into the mow *in a jiffy*.

You can take in bound green feed just as well as hay with the BT Unloader. Handles the biggest load in two bundles. No barn complete without it. Write today for Catalogue telling all the facts about

The BT Sling Unloader

It is simple in construction and heavily built all through. There are no springs to get out of order. The rope grip is sure and never injures the draft rope. Any sized rope up to one inch in diameter may be used with the BT car—most cars will not use anything larger than 3-4 inch rope, which is too light for sling work. Large Draft Rope Wheel makes it much easier to elevate bundles than with other styles of cars.

THE BT SLINGS

are made from best soft-laid manila rope. The slats are of selected Maple, well oiled and finished. The trips are all maleable and cannot be broken or tramped apart. They will lock easily in any position and trip easily no matter how the bundle twists.

BT SINGLE RAIL TRACK

The BT Steel Track will carry three thousand pounds with rafters three feet apart. No other track will stand this strain. It is easily and quickly erected.
Our line includes Sling and Fork outfits for Wood Track, Rod and Cable Trucks. Write for Catalogue. It is Free.

SEE AND TRY A DE LAVAL CREAM SEPARATOR

Be Your Own Judge

We cannot believe that there is a sensible man living who would purchase any other than a DE LAVAL Cream Separator for his own use if he would but SEE and TRY an improved DE LAVAL machine before buying.

It is a fact that 99% of all separator buyers who do SEE and TRY a DE LAVAL machine before buying purchase the DE LAVAL and will have no other separator. The 1% who do not buy the DE LAVAL are those who allow themselves to be influenced by something other than real genuine separator merit.

Every responsible person who wishes it may have the Free Trial of a DE LAVAL machine at his own home without advance payment or any obligation whatsoever. Simply ask the DE LAVAL agent in your nearest town or write direct to the nearest DE LAVAL office.

The new 72-page De Laval Dairy Hand Book, in which important dairy questions are ably discussed by the best authorities, is a book that every cow owner should have. Mailed free upon request if you mention this paper. New 1913 De Laval catalog also mailed upon request. Write to nearest office.

DE LAVAL DAIRY SUPPLY CO., LIMITED

An Ideal Green Feed Silo

Soon pays for itself

This is true whether you are keeping cows for dairy purposes or are a stock raiser

It has repeatedly been stated by some of the best posted authorities on farm economics that even if a dairymen or stock raiser had to buy a silo every year he would still be money ahead.

There is absolutely no question about the advantage of erecting a silo. It insures for the dairyman a larger milk flow in the winter or during dry weather and takes the place of grass for steers or sheep during drought.

If you are considering the silo question, a little investigation must convince you that the **IDEAL GREEN FEED SILO** will give you the best service and keep your silage in the best condition.

All our silo staves are thoroughly air dried and then saturated with a solution which prevents rot and decay and adds many years to the life of silo.

You will find our new silo book contains much information about the erection of silos and the many advantages of silage, and we will be very glad to send this book to any cow owner upon request.

Proved Value of Spraying Potatoes

Six Applications of Bordeaux Increase Crop 125 Per Cent--Economical Methods of Making Spray Mixtures.

By Daniel Dean of Tioga County New York.

THE fact is patent to all our readers that blight and insect pests tend to very materially reduce the potato growers' profits. The leaves are what may be called the stomach of the plant and when the stomach gets impaired the whole system is thrown out of alignment.

Stripped of their leaves by bugs and blight the potato plant cannot thrive and thus only attains a minimum growth.

The following thoughts from the columns of the New England Homestead is well worthy of the thoughtful consideration of every potato grower in the Maritime Provinces.

"Last year spraying was even more profitable than usual in this vicinity. Frequent and heavy rains in July, August and September made conditions favorable for severe attacks of late blight, which rotted over 50 per cent. of the local crop. A neighbor spraying six times with bordeaux increased the yield from 152 bushels an acre on the unsprayed check rows to a yield of 334 bushels an acre where sprayed, a gain from spraying of 182 bushels an acre. I sprayed 14 times and know that the extra spraying paid me. The sprayed stock was salable at 7 cents a bushel more than the unsprayed, because of freedom from rot. The trouble of careful sorting at digging time was saved, and storage made much safer. I always begin to spray very early. It is often hard to find the first blighted leaves, because they are usually next to the ground.

IMPORTANCE OF HAVING POWER SPRAYER.

Spraying is so profitable that horse power sprayers should be used on all but small areas. A good sprayer should have a pump powerful enough to develop at least 125 pounds pressure while covering several rows so thoroughly that every leaf will be covered at each application. The pump should be as simply constructed as possible, preferably with single-acting, outside-packed cylinders.

The pump must be made of brass where exposed to bordeaux, as that quickly rusts iron. While more costly it may pay to have the spray boom and other piping also of brass. Rubber piping deteriorates so quickly that I never use it except a single length between pump and spray boom to permit quick movement. A large air chamber makes even pressure and makes the pump wear longer. I am particular to have the whole machine strongly built and of good material, to stand the strain of pumping.

Last year, 1912, I had profit enough from spraying each one of my 18 acres to buy a first-class traction sprayer. Where the tops are large enough nearly to meet in the rows, the sprayer wheels may cause great injury by crushing them. This can be prevented by an arrangement to draw them out of the way of the wheels. I have a home-made top protector made of a 2x4 scantling. It reaches across and under the foot of the machine. Four old hayrake teeth are fastened to it, one just inside and one outside each wheel and just touching the ground. A lever lifts the teeth off the ground for turning at the ends of the rows and for traveling. Experiment will tell just how far ahead of the wheels the rakes should work.

Time is money in the spraying season. It can be saved by a convenient apparatus for making the bordeaux. Much depends on the water supply; if from a well a small gasoline pumping engine saves labor and the cost is small, as the engine can be used for many other purposes about the farm and in the house. An elevated platform with a mixing tank of larger capacity than the tank on the sprayer, a smaller tank or barrel half the capacity of the first and two barrels with wooden hoops makes the arrangement, I have found, very efficient and economical.

METHOD OF MAKING SPRAY MIXTURE.

Here is my method of making: One barrel has, say, 40 gallons of water, measured into it at night, and 80 pounds of blue vitriol in a bag suspended at the top of the water. Thi will dissolve by morning, and when stirred will give a solution of two pounds blue vitriol to the gallon. Fresh stone lime, the lumps only, is slaked in the other barrel. If kept covered with water, it will keep its strength all summer.

For a 100-gallon tank sprayer 50 gallons of water is pumped into the mixing tank, six gallons of the blue vitriol solution added and thoroughly stirred. For the first one or two sprayings some experiment stations advise using only two-thirds as much blue vitriol. Thirty or 40 gallons of water is pumped into the second tank which is elevated above the first, and about 12 pounds of lime stock added and well stirred. The lime solution is then added to the blue vitriol solution and well mixed at the same time. The more diluted the solutions when mixed the better and more adhesive the bordeaux.

After mixing I test with a solution of ferrocyanide of potassium, which may be had at any drug store. Ten cents' worth can be dissolved in an oil can of water and left ready to test with a few drops. If a brown color shows where the test solution strikes the bordeaux, I add more lime, stir up and test again till no color appears. If not enough lime is used, the tops of the plants may be injured. On the other hand, too great an excess of lime makes a mixture which does not stick nearly so well to the foliage as when just enough lime is used to neutralize the blue vitriol.

For late potatoes, I spray with bordeaux every year, beginning when the plants are 6 inches high, again at least every 10 days till danger of blight is past and always just before rain if possible. No one should be satisfied with any sprayer that will not cover every leaf of large vines at each application. Spraying costs just as much for a poor crop as for a good one, so I use good seed of the right variety for my soil, fertilize well and keep free from weeds. The largest gains an acre from spraying come from the best crops.

In my section of Western New York potatoes are subject to the attack of many diseases which, without spraying, often make the crop unprofitable. For instance, last year. In its wild state the potato blossomed before setting tubers. Now, under cultivation both processes overlap, usually at a time of great heat. This is the critical period in the life of the crop. With main crop potatoes in my locality it is when various forms of blight and sun scald are most active.

BORDEAUX REDUCES INSECT ATTACK.

I have found that insects are much less troublesome where bordeaux is used. Paris green is much more efficient when applied with bordeaux than where applied in other ways. It sticks much better and is evenly distributed over the leaves by the bordeaux. Also there is no danger of burning the foliage. I apply from four to eight ounces an acre just as the slugs of the beetle are hatching. Then the slugs are easily killed.

When I use paris green, I always make a stiff paste of it with a little water in a pail, then dilute to three or four gallons and put into the sprayer in proper quantities. I am always careful to mix it just before using, as it settles quickly. Arsenate of lead may replace paris-green where bordeaux is not used. It is more expensive and less efficient, but is safe to use alone.

In western New York the little black flea beetles do great damage during dry seasons by making many small holes in the leaves. Bordeaux greatly reduces the damage done by them. Hot, dry weather, particularly following a wet period, may also cause the leaves wholly or partly to die. This tip-burn or sun scald is often mistaken for blight. It is not helped directly by spraying, but spraying increases the vigor of the plant.

Fusarium disease hurts the tops by destroying the roots. Spraying helps it indirectly. Late blight and rot is the most destructive potato disease we have. It does most damage in northeastern states from Maine to Wisconsin, although in wet seasons it may spread farther south and west. I have found it the easiest one to control when spraying is well done. To do this several conditions must be observed. In the first place the disease passes the winter in the tubers. I select the seed from a crop which has been free from the disease the year before, and better for several years.

When the soil is full of water from rains the disease germs multiply on the seed tuber and then rise in the water to the surface of the soil. As the plants have been beaten to the ground by storms the germs attack the leaves and easily multiply very fast if the weather is damp and cloudy. As the leaves are destroyed new crops of germs are constantly found on the under sides covering that part of the leaves with a gray fuzzy growth. These spores or germs are spread by the wind and beating rains and may sometimes destroy the whole fields in a few days. After the potatoes are formed in the hill, the germs may fall from the leaves to the ground and rot the tubers. This is especially likely to happen if the fall is wet.

HOW FUNGICIDE ACTS.

The action of bordeaux on blight depends on the fact that the germs of blight are easily killed by a solution of copper, even if very weak. Bordeaux is a solution of copper sulphate in water, with just enough lime to keep the copper from burning the foliage. When sprayed on the potato

plants the water evaporates, leaving the solid parts on the plant.

Perfect protection against the late blight demands that all the foliage be covered with bordeaux all the time through the blight season from July to October. As late potatoes are growing rapidly growers cannot keep the tops always covered, but can spray often enough and thoroughly enough to make the amount of damage very small.

Blight reduces the crop in two ways, by killing the tops and by rotting the potatoes. The germs fall from the leaves to the ground and when that is wet penetrate down to the tubers. I always spray potatoes in blight years till the tops are all gone. Often potatoes growers stop spraying late in the season because most of the tops are dead. Last year two neighbors stopped spraying after two and six sprayings respectively. Heavy rains followed for several weeks. The one lost half his field, the other probably 5 per cent. In a very wet fall I believe it may pay to spray the ground when only a few plants are yet living; this may be made very effective."

The Importance of Keeping Accounts on the Farm.

Farming as a business will never be placed on a satisfactory basis until the farmer keeps a system of accounts to show whether he is gaining or losing by his method of management. We believe we are right in saying that a very large proportion of farmers keep no system of accounts at all; as a result they do not know whether they are gaining or losing in the year's operations. It may be that they are making a good profit in one line, and losing in another, but they are unable to know the sources of the gains and losses without some system of keeping accounts. Some farmers will tell us that they have no need for keeping accounts so long as they are making money, but this attitude is unbusinesslike. It is probable that if their management were put to the test it would be found that they are carrying on some operations at a loss, or that they could make more money by changing the emphasis on certain crops in the rotation. The cow-testing Association has shown many a farmer to his great surprise that he was keeping cows that did not pay for their feed. In a similar manner keeping accounts would open the eyes of many a surprised farmer to the fact that he was growing crops that did not pay for the work put upon them.

The keeping of farm accounts does not require much time or much education. The simpler the accounts are the better, at first, but as experience is gained and more information is desired the system will gradually become more complex from year to year.

The first thing to do is to make an "inventory" of all the property, the cash, the debts, and all outstanding accounts, so as to arrive at the exact condition of the business at a certain fixed time of the year. The complete list of all the animals, machinery, etc., should be made in a book, kept for the purpose, and the actual value of each put down. (See Chart 1.) This stock-taking would require a few days perhaps but it is usually done at the beginning of the year when other work is not pressing.

Next, it is necessary to keep a detailed account of all receipts and expenditures. As many of the items will be of a cash nature a "Cash Account" should be opened (See Chart 2). If these are notes these should be recorded in a "Notes Account (See Chart 3). At the end of the year when the inventory is taken these accounts are balanced,

CHART 1.—HOW AN INVENTORY BOOK MAY BE KEPT.

and the "Financial Statement" made out, to show the gain for the year. It may be put down like this:

Jan. 1. 1912 Total Inventory	$8250.00
Jan. 1 1913 "	9050.00
Net profit for 1912	$800.00

But the foregoing does not show the sources of the profits, hence some thing more is necessary. Separate accounts should be kept of every field on the farm; these may be called "Field or Crop Accounts." The field or crop is charged with all the labor manure, seed, etc., put upon it, and credited with the proceeds. A good plan, and one suggested by Mr. Fixter while Superintendent of the Macdonald College Farm, is to rule an account book after the accompanying chart 4, reserving two or three pages for each field; and at the end of the year to make a statement thus:

(1) BARLEY CROP—FIELD OF 23 ACRES.

Cost of Production—	
Rent of land at $4.00 per acre	$92.00
Manure, 1-3 of portion used in rotation at $6 per acre	138.00
Plowing, 16 1-2 days at $3.00	49.50
Harrowing and discing, 4 days at $3.00	12.00
Seed, 40 bushels at 75c	30.00
Sowing, 2 4-10 days at $3.00 per day	7.20
Rolling, 1 5-10 days at $3.00 per day	4.50
Reaping, 6 days at $3.00 per day	18.00
Twine, 80 1-2 lbs. at 11c	8.85
Shocking, etc., 14 days at $1.50 per day	21.00
Horse raking, 4 days at $2.25 per day	9.00
Drawing, 7 6-10 days at $3.00 per day	$2.10
Loading, unloading, 13 days at $1.50	19.50
Use of farm machinery, 30c per acre	6.90
Gathering stone, 2 days at $2.25	4.50
	$444.05
Yield of Barley per acre—46 bus. 13 lbs.	
Yield of Straw per acre—1 ton 1650 lbs.	
Allowing $3.00 per ton for the straw —$126, the grain cost nearly 30c. per bushel.	

(2) OAT CROP— FIELD OF 40 ACRES.

Cost of Production—	
Rent of land at $4.00 per acre	$160.00
Manure, 1-3 of rotation, at $6.00 per acre	240.00
Plowing, 31 2-10 days at $3.00 per day	93.60
Harrowing and discing, 24 1-2 days, at $3.00	73.50
Seed, 80 bushels at 75c	60.00
Sowing, 3 9-10 days at $3.00 per day	11.70
Reaping and mowing, 11 1-2 days at $3.00 per day	34.50
Shocking, etc., 22 days at $1.50	33.00
Drawing, 10 6-10 days at $3.00	31.80
Loading, unloading, 16 8-10 days at $1.50	25.20
Horse raking, 4 days at $2.25	9.00
Twine, 140 lbs at 11c.	15.40
	$787.70
Yield per acre—56 bushels 17 lbs.	
Yield per acre straw—1 ton 1809 lbs.	
Allowing $3.00 per ton for straw, 76 tons—$228.00, the grain cost 24 3-4c. per bushel.	

But some will say that these details demand too much labor on the part of the average farmer. In reality very little time is required if the items are jotted down every evening in an account book. Occasionally it may require the services of a teacher or a book-keeper to sum up all the details in a financial statement where the owner carries on several enterprises and is anxious to locate the sources of the profits.

One of the most valuable features in keeping farm accounts is the revelation they give of the amount of money spent on farm machinery, buggies, sleighs, etc., every year. Here is where the profits of the farm are often wasted, and here is where good management is clearly exhibited by the cutting down of unnecessary expenditures.

Moreover, the keeping of farm accounts enables the farmer to determine the most profitable crop out of a group of competing crops in a rotation. A most important feature of good management is to plant crops which bring the largest money returns and that require the most advantageous use of labor. For example, since horses and help must be maintained, it is not economical to plant crops requiring the labor or horses and men for only a portion of the season. The largest returns will, as a rule, be secured from those enterprises that require labor at different seasons of the year.

Successful farming demands the keeping of accounts just as much as any other successful business but, as we have already stated, very few farmers make any kind of an effort in this direction. It is becoming recognized more and more that the information gained by the farmer in keeping accounts is most valuable, and in some sections of the United States, a book-keeper or accountant is employed by a group of farmers in a district. Moreover, some of the colleges of agriculture in co-operation with the U. S. Department of Agriculture at Washington are helping farmers to keep their books. And so the movement is growing. It is hoped that it will spread to the farmers of the Maritime Provinces.

Improvement of the Dairy Herd.

(The following paper on "Herd Improvement" was read by Mr. Walter M. Lea, of Victoria, before the recent meeting of the P. E. I. Provincial Dairymen's Association.

Mr. Lea is one of the most successful and enterprising dairyman on the Island. His herd supplied the greatest amount of fat and butter per cow in that province for the year ending June 1st, 1911. In this contest he had to count every cow that was milked even for a month, consequently he had to average on 16 cows, whilst he only milked 11 for the year the others being heifers of a few months, or cows that were sold.

The cow testing records, show the following:

For greatest amount of fat per cow furnished a creamery during the year ending June 1st, 1911.

1st. Walter M. Lea, number of cows 16, lbs. fat delivered 4293, estimated lbs. butter 5010, avreage per cow 313⅛ lbs.

The above is only for the amount of fat sold per cow and gives no credit for the amount of fat fed 12 calves, used at home, and lost during the five weeks absence of a large number of cows, following the different shows.

During the year ending December 31st 1911, when the year in the cow testing association ended, Mr. Lea's herd averaged 9113 lbs. milk per cow for the 11 cows which completed the full year.)

HERD IMPROVEMENT.

Within the last few years the cow testing associations have been doing good work for the dairy in Canada, by endeavoring to awaken farmers to the necessity of learning the producing abilities of the different members of their herds. This is certainly the first step in herd improvement and is of inestimable value to the industry but we must not stop here for when we cull out an unprofitable cow, we must see that a better one takes her place.

Breeding from pure bred dairy sires whose ancestors are heavy producing stuck, and properly raising and growing the calves, is good advice easily given, but when we consider the conditions under which the majority of calves are now raised we fear improvement will be very slow.

We learn so much about the unprofitable cow, the boarder, or robber cow, that is seems has been for ages secretly, and sometimes in disguise robbing the industrious dairyman, that I fear many cows will be condemned before a fair trail is given them, to decide whether it is their or their owner's fault that their production has not been satisfactory.

And while I commend the yearly testing of dairy herds and the keeping of milk and fat records I think them of little value for comparison excepting to their owners, for the reason that, taking any one year, some cows in a herd are almost sure to have a more favorable season than others, slight accidents especially at calving, the season of the year they happen to freshen, condition of flesh at starting, and many minor hindrances will make a remarkable difference in the returns per cow shown on the sheet, that is known only to the owner of the herd, and I often wonder at the deductions drawn, by dairy instructors from the record sheets between the different members of the herd with the supposition, that each cow was on equal footing.

Now, I have been keeping herd records for the last seven years, and will continue to do so as long as I breed cattle for dairy purposes as the knowledge thereby gained, is such that I simply cannot afford to quit.

Besides the benefit of knowing just how much milk and fat each cow has produced, we can by weighing at once detect the effect of changes of feed, changes of temperature, lack of any care, and how each cow is satisfied with her milker, etc., so that we are enabled to help correct many otherwise secret hindrances, before any serious loss occurs.

Milk records also increase the value of a cow and her offspring, if we offer them for sale, and I consider those who drop cow testing after one season, with the idea that now they know their cows, are making a great mistake, for this I have invariably found that we never yet in one single instance came across a cow that had been "properly raised and grown from calfhood" that did not exceed the 6,000 pound limit, and in every instance, where a thin cow was put in good condition before again freshening that her "per cent fat" as well as milk flow was greatly improved.

So if we would have better cows we must pay more attention to the raising of the young heifers.

So much has been said and written on this subject, that it seems wearisome to take it up in this article, but when we see the conditions of the calves of this Province in general we must conclude, that either our farmers don't believe it pays to grow them properly, or simply to appear to have yet learned how. Every farmer knows, or should know that the younger the animal the cheaper the growth, that a milking two-year-old heifer will pay many times the extra cost of her feed (if properly fed) over her three-year-old freshening sister and will be a better cow for all time.

Why then do we have so many heifers with first calf at three years old? Is it because we don't believe it pays to grow them faster, or are we still following the old system of feeding only the producing cows?

Now, while I consider dairying the most profitable line of live stock husbandry for our fathers to engage in, we must admit, that to lay the foundation for a good dairy herd, we must invest considerable capital, such as feed, in the young stock, and it is not by any means a line of the least resistance in farming and requires considerable intelligence and skill to make it a success.

And to the man who has been accustomed to marketing considerable of his farm products in their raw condition, to turn at once to properly feeding his dairy cows, and at the same time "grow the young things better," it will strike him as taking an alarming lot of feed.

Here is where the most of the trouble comes in, to see a lot of good saleable hay, grain and roots go into calves and yearlings, (that could be cashed at once) with only the hope that some day he will be able to realize profits on his investment, requires more faith and patience than most farmers possess, added to this (even where the faith is strong and intentions good,) when milk is furnished cheese factories from spring calved cows, it is impossible to properly grow a calf without an almost prohibitive amount of whole milk.

With the patrons of a cream gathering creamery it is altogether different, and where winter dairying is carried on, and an easy matter to any one of experience, and valuable grade herds can be raised at a moderate cost.

It is quite evident that a few dairymen have yet realized, that not only is a well raised herd of grade cows much more valuable for their owner's business, but a splendid market is open to him who would raise surplus condition," bring all the way from $50 to $100, in and around our Maritime towns, we sold some eighteen head of fresh grade cows last season and could not nearly supply the demand, having enquiries from as far as Medicine Hat, Alberta, and as a sample of what can be accomplished in herd improvement by breeding, feeding, etc., I will instance one case that I know the particulars of.

Just ten years ago a farmer in our vicinity started breeding his common cows to our pure bred bull, and has persistently followed this up from year to year, always using the best pure sire, and keeping all the heifer calves, growing the young stuff properly as well as the producing cows, improving the quality as well as increasing the number, until at the end of ten years he has a high grade herd that closely resembles the pure breds in appearance and production, and are a pleasure as well as a profit to their owner.

This past season I paid him $475 for seven head of grade heifers and cows for the Nova Scotia milkmen, and it's needless to add that as this man regularly weighs and tests his milk, that while I got good cows ("he has no other kind now") I didn't get the pick of the herd. These were only his "yearly surplus," and I wish to emphasize, that it is easily possible to breed up a high class herd at a moderate cost. Don't envy the owner of some record-making cow and think her kind beyond your reach a son of her's or her like will, sire on your common cows, heifers that if properly fed and developed, may crowd her close, only be certain that when you do select a sire for your herd, that he is from a real good dairy cow. Remember that all records for yearly or weekly work are made by clever men who by their knowledge of the business can make a very creditable record from a pretty ordinary cow.

But when you do get the opportunity to purchase or secure the service of a high class sire, you must expect to pay a fair price for him. I don't think there is any line of improvement in live stock husbandry equal to the value to be obtained by the use of a "good dairy sire." When we consider that in a pure bred bull we have handed down to us the result of the skill and labour of intelligent men for hundreds of years, and at the price usually obtained for a sire of merit I consider this a remarkably cheap method of obtaining high class cows.

The wonder is why with the Government assistance given institutes, that every cow in the province is not bred to one, and as an example of what improvement is possible with even the first cross let me instance one case. A twenty-eight dollar ($28) scrub cow (as she was bought for) was bred to our pure bred sire, and at an Auction Sale we bought in the yearling heifer from this mating. She freshened at 26 months and proved a most profitable cow, giving in one season 11,000 lbs. milk and 532 lbs. estimated butter, we afterwards sold her for $100. She cost her breeder $1.00 and myself probably $15 or $20 more than a scrub grown one would have cost. She was sold for $100 or about $75 more than had she been sired by a scrub bull, and was fed "scrub" feed.

Now I have endeavored to point out the direct financial gain to be had through intelligently and persistently following up cow feeding, testing and breeding.

Another point I would draw your attention to is that as we breed from strongly constitutioned animals as most of the good ones of necessity are, and keep them in strong growing condition we suffer much less from sickness and loss of stock. The old saying that farmers must be losers is not altogether true. How many calves do you imagine after consuming considerable new milk fail to reach one year old? I think a sufficient sum is yearly lost to keep a pure bred sire within the reach of all.

Nor is this all. A well kept high grade herd is a valuable asset to the farmer in their attractive appearance. There is no man, woman or child but takes pride in stock, that draw the attention of every passer by. They are a pleasure to handle and the sort of property that can be disposed of at a good figure, at any season of the year. But in passing through the country when cattle are on pasture, it is hard to find a herd, that show by their conformation and markings, that they are all of the one breed or grade.

Now for the patron of a cream gathering Creamery, there is no good excuse for not always raising good calves every year.

We have not only never lost one since starting the cream gathering system, but have always grown them to their limit. We lately slaughtered one grade at a year and three months that dressed 448 pounds baby beef. This was only an average calf, some grow much larger.

With patrons of a cheese factory however, who have all the cows freshen in the spring, it must be a very difficult matter, as there is to my knowledge no "good substitute" for skim milk, and as the cheese factories open about the time the great majority of cows calve in the spring there is always a temptation to cut the calves very soon off milk, for the milk in them is capital invested in the business, while milk at the cheese factory can be cashed at once. This is the reason why our dairy cows are not improving faster, and why dairying is often thought not to pay; the young heifers are neither well enough bred, fed nor cared for.

However, this condition of affairs can be easily improved with little cost, and were I a patron of a cheese factory, I would have at least a few cows freshen in February. This would give the calves four months of milk before the cheese factory opened, then if I could not induce the company to put in a plant to manufacture the butter, (and the other patrons to do the same) churn it at home, as we must and can only improve dairy conditions through the young stock, and cannot afford to neglect the raising of the calves.

If properly fed, cows calving at this season will milk fully better than those indifferently cared for through the summer until the end of

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

ORGANIZING A FARM

To some men a farm is merely a rude, rough, abiding spot for them and their family a few years, till they can move to another of like character, or till they die. There is no other ideal in their mind and there is no other outcome of their hands. To others, a farm is a center around which group large possibilities. It is a place for the building of a home from which radiates light and warmth for all the better elements of worthy character. It is a place for the exercise of a noble affection for wife, children, animals, orchard, fields and all. Children born in such a home carry with them all their lives the fondest of recollections and the impulse of a finer manhood.

If we look over such a farm, and there are thousands of them, we will find in every instance that here lives a man who has the power to organize forces for their best expression. Such a man lives a rich life, even though it may not bring him public acclaim and recognition. His children, his buildings, his animals, even, his crops, "rise up to call him blessed" and he is blessed. There is no sense of the favor of Heaven and the respect of men that can compare with it.

The man who can thus organize a complete farm home, one that becomes an inspiration to himself and all men who behold it, is always mated to a woman of like character and purpose. Here is seen, as no where else on earth, the fruitage of a complete union.

The careers of other men, the lawyer, the doctor, the merchant, or the banker shows no such results of united effort, no such contribution of woman to man, and of both to a beautiful expression in life. There is no picture so powerful in its appeal to the human heart as the picture of a complete farm and farm home. There is no spot on earth where so much can be done that will bring lasting satisfaction to the souls of men, for so little expense, as on the farm.

Every word we have said is true, absolutely true. Why then do we see so few of such homes? Why do we find so many men who look with sordid eyes upon this noblest of opportunities for human living? Why is it that so many farmers look upon the farm home as a prison pen, a place of toil, suffering and privation, a place to get away from, both for their children and themselves, as soon as opportunity will permit, a place where the least money possible shall be expended in the way of good architecture, flowers, trees and those adornments they would gladly lavish on some home in a village or city?

Everywhere we find in the minds of such men a lack of ambition and pride for their farm and home, a looking forward to the hope of disposing of it and ending their days elsewhere. It does not seem to occur to them that here is a fit place for the finest thought, ambition and purpose. Here is a place where they can demonstrate to the world that they have the ability to organize to the highest perfection in art, in beauty of surroundings, in financial profit, as proportioned to capital. Rich men from the cities vainly seek to do this by a wasteful expenditure of money on costly buildings, but it is as empty of perfect expression as the furebelows of a milliner in place of a true woman. The crying necessity of Maritime agriculture today is not more land. It is not for a chance to emigrate somewhere else, but it is for men who will put more thought more conscience, more patriotism, more pride, more taste, in short, more brains into this pursuit called farming.

MACHINERY VERSUS HAND LABOR

In the minds of many intelligent people there is an unreasoning prejudice against the use of "labor saving machines." The history of obstructive policies adopted by mill operatives and other skilled laborers during the past two hundred years in their blind efforts to stop the introduction of certain types of machines would make a good story, but too long for these columns. The cotton spinning laborers fought the introduction of the loom and the jenny with strike and the torch. Shoe making machines were as bitterly opposed by thousands who were led to believe that the shoe makers would all soon be out of work. It did not work out so in any of these cases. So many of the southern farm people who have dreaded the invention of cotton-picking and cotton-chopping machines will find that in due course, when these things have come about, the machines will prove blessings to mankind and especially to the class it would, at first sight, appear to compete with.

Labor saving machinery is as useful as the burden bearing horse which takes the place in our civilization of the human pack carriers of the less civilized countries. Like the railroad, the telegraph, and telephone they are calculated to save human labor, drudgery, human time and soul-killing efforts by permitting the education and upbuilding of the mental and moral natures through devoting a large part of our time to the use of uplifting agencies.

The sowing of grains which formerly required 10 hours and 35 minutes by hand, can now be accomplished in 32.7 minutes by machinery; harvesting and threshing, which required 46 hours and 40 minutes by hand can now be done in one hour by machinery. The mowing machine performs in one hour and six minutes what a man with a scythe formerly could accomplish in 7 hours and 20 minutes. Potato planters will now plant as many potatoes in one hour and 25 minutes as formerly required 15 hours to accomplish by hand.

Who is benefited by farm machinery? First, the user, second, the consumer, and finally all of those associating and trading with these first beneficaries. How shall the time thus "saved" to the human family by labor-saving devices in all the walks of life be employed? By increasing production? Yes, and by wisely devoting a part of that time to educating and training the producer to a right use of the increased blessing by which he is now surrounded. How shall we increase the influences for mental instruction and moral development? By devoting time and energy daily to these matters while not neglecting the material or business routine of our lives. Farm machinery may thus prove the means of leading us to higher planes of thought and daily living.

THE DUST MULCH

If one turns over a board or scraps away some straw lying upon the ground, the ground is seen to be moist while the surrounding exposed ground may be dry. If one scatters straw upon dry grodnd, it will be found in a few days that the dry ground has become moist. The upper few inches of surface will be seen to have accumulated moisture. This moisture would have been given up to the air and thus lost to the soil had not the straw been applied. A layer of dry soil acts in the same way when applied to land. It is plain that this layer of dry soil can be applied to the land from the land itself, by the use of suitable machinery. The dirt mulch can be applied with but little cost and because of this, it saves the moisture so well, it becomes of incalculable value to farming. After a heavy rain, one observes the soil in the garden or in the root field to be packed and hard; by running over the ground with a cultivator, the packed soil is broken and a mulch is established. The formation of the mulch prevents in great measure the loss of moisture. The loss of moisture is prevented by the stoppage of the capillary movement of water. It would be much the same if one were to cut off a lamp wick and fasten the two cut ends by wires. Oil would not pass from one part of the cut wick to another. Forming a mulch on land does not entirely prevent the loss of moisture but the moisture saved may amount to 50 per cent or even more.

There are several conditions that affect the dirt mulch. The deeper soil mulch is the more effective but the deep soil mulch is more expensive to make and the deeper the mulch the more fertile soil there is lost for the plants. A soil mulch becomes poorer with age and so it may have to be renewed occasionally. This is especially true if the rain should come. Dirt mulches can be better made when the soil is moist.

THE CANADA THISTLE

A prominent weed pest which farmers should exert an effort to exterminate as soon as it makes its appearance in the fields is the Canada thistle. This weed is unlike any other that grows and is easily found by its extremely prickly surface. It spreads at the base and is a cumberer of the ground as soon as it makes its appearance. A full grown plant will often cover a ground space of eighteen to thirty inches in diameter, which it completely controls, there being no animal, except the mule, that attempts to feed on it foliage, and this is only when the thistle is young and tender. The thistle usually acquires its growth, throws out its seed top, blossoms and prepares for spreading its seeds in the latter part of July and first of August. In the month of August the harvest is completed and the ripened seeds are sent broadcast over the country in a little tuft of cotton-like fibre.

The only successful warfare that can be waged against the Canada thistle is the hoe in the hands of the interested land owner or the attentive hired hand. The thistle may be cut with a sharp hoe before it has acquired much growth and thus destroyed, or it may be cut later with a briar or weed cythe, close to the ground, any time before the seed top is formed and thus completely destroy the chances of growth.

This variety of thistle is not a hard thing to destroy or keep in check, when a little attention is given at the proper time. It inclines to grow in pastures and meadows, in tame grass lands, in waste places about the farm. It is not a plant that proves troublesome in cultivated fields. The sharp hoe in the hands of the attentive boy or hired hand during odd hours in the month of June will keep the Canada thistle from proving a serious annoyance.

EDITORIAL

Almost every dairy farmer who commences to weigh and sample his cows' milk individually says at the end of a few months "I find some in my herd were kept at a loss." Some men find only one or two cows, others state that they have found too many in the herd play a losing game.

What does this mean? Just this: that despite all the exuerience gained from years of practical dairying, the farmer finds that in order to become thoroughly 'practical' he must requisition the aid of dairy records. Neither the cow's appearance, nor the owners knowledge of some short-period yield of milk (extraordinary as that yield may have been for a day, or one week, or a month) will testify with certainty to each individual cow's ability eo pay her way for the whole year. Cow testing provides a simple and eminently practical way of discovering, not only if each cow pays, but which cow pays the most profit on the twelve months' transaction of feed consumed, and milk and fat produced. Those large profit cows are revealed only by practical cow testing.

Cows are apt to cheat the unsuspecting dairyman unless he keeps tabs on the performance of each one; many dairymen have found this out to their utter astonishment and regret. Don't take chances with your herd, be certain that each cow pays; it pays you to find out. Individual cow records help the practical farmer to build up a profitable herd.

Raising Green Ducklings.

In his book entitled "Poultry Truths," Stephen B. Twinging, proprietor of the Afton Farm at Yardley, Pennsylvania, says, according to an exchange:

A man can go into the duck business on a much larger scale than he can any other branch of the poultry business, i. e., he can depend more on hired help. There is not near the amount of fine labor in duck raising as in chicken, guinea or turkey growing. Freedom from disease also makes it possible to have larger duck farms than chicken farms. Successful large duck plants are the rule, while successful large chicken farms are the exception.

In starting a duck farm it is important to have sandy or well-drained soil. Water in the right place is good, but remember the day of the puddle duck is past. To get the price today your ducks must be raised under sanitary conditions and ducklings so raised show the benefit of such treatment. Too great care cannot be used in the selection of breeders. Get stock with long, low hanging keel, with large heads and thick necks. Heavy legs of a rich, reddish orange shade. Watch the eyes. They should be of good, wide, deep leaden-blue in color and have a firmness. Weakness in the vitality will show up as quickly in a duck's eyes as anywhere. Watch out for weak, watery eyes. Ducks hatched the first two weeks of May are considered to make the best breeders. On Afton Farm they are grown the same as the market ducks up until eight weeks of age. They are then selected and put into lots covered with good sod and having a stream of clear water running through them. They are now fed twice daily a moist mash of equal parts bran, cornmeal and middlings, with eight per cent. of beef scraps added. Here they are allowed to play in the water, roam over and eat the grass and enjoy light feeds till about the middle of November, at which time they are again sorted and put into the laying quarters. (Any birds not up to expectations are dressed for market. Better have less breeders than breed from any inferior birds.)

In feeding for eggs thay are given one part bran, one part low grade flour, one part whole corn, two parts whole wheat, two pares cornmeal, four parts cut clover hay, 12 per cent. beef scrap, sand, grit and oyster shells, all they will eat; mix with water till crumbly. The mixture is by bulk measurement.

This is the main food for getting eggs. However, no set formula will get the very best results. Vary according to conditions. Use more middlings if bowels are very loose, less if too tight. Vary the corn according to the weather, as corn is heatening. Amount of cornmeal should be regulated so as not to keep breeders too fat or too thin. Meat scraps affect the fertility; if you are getting a lot of rotten eggs you are using too much scrap and make the birds averous. The clover hay affects size of eggs, also, to an extent, the yield.

Early may hatched breeders should drop their first eggs by Thanksgiving, and be right down to business by Christmas. They should now lay heavy until June 1, when they will start to drop off in egg yield, and be practically through by the first of August. A good strain of Imperial Pekin ducks, with proper care, will yield about 150 eggs in eight months, then they will lay off for four and get busy again. During these four months they should be on a grass range, with plenty of clear water and light food. It is best for them, and the cost of maintainance during the inactive season is normal.

Ducks lay between four and eight in the morning. The eggs should be promptly gathered at eight, lest some get broken as they lay on the floor.

Lightly wash the eggs but do not rub them unless very dirty. Put them on trays and set as soon as you get a machine full. Duck eggs on Afton Farm are set daily and better results are secured than when set every four days.

It is the common opinion that ducks are hard to hatch and easy to raise. Mr. Twining runs his machines at 102 degrees the first two weeks, 102½ third week and 103 the last week of the hatch, when it reaches 104 or 105. Eggs are turned once a day till first test (seventh day), then twice daily till they pip. He then places all the pips up and closes the machine until the hatch is over. A three-sixty hen egg machine will accommodate two-eighty-eight duck eggs, and if you average 150 good ducklings per hatch throughout the season you are doing well.

After the egg shells are removed the ducklings are left in the machine until thoroughly dry. They are then taken to the duck nursery, where there are pens 12x4 with brooders 4x2. Overhead hot water heat is used. Pens are heavily bedded with straw. Temperature of brooders is ninety and it is endeavored to maintain absolutely even heat. There is water and coarse sand put before the ducklings right away and is left there till night, when they are fastened close to the brooder. They get their first food the next morning, which is Pratt's Patent No. 5, which, though an expensive food, they find well worth using. They are fed on this food five times a day for four days then gradually weaned onto a mash of (by bulk): six parts bran, two parts cornmeal, two parts middlings, one part low grade flour, five parts cut greens, 10 per cent. beef scrap, sand, grit and oyster shell, all they will eat up clean. They are fed this until eight weeks of age, when they are gradually changed to the fattening food, consisting of four parts cornmeal, two parts low grade flour, one part bran, 12 per cent. beef scrap; add a little cut greens to make it tasty, also sand, shell and grit for the digestion.

Many feed good food but fail to provide proper grinders to digest it. The cut greens are either lawn clippings, cut green clover, corn fodder, dwarf Essex rape or wheat.

At ten weeks they are in the best condition to kill. If they have been carefully fed and attended to they will average ten pounds to the pair or over. Now if they are properly prepared for market they will command a price that makes production profitable.

The breeding ducks have a stream of clear water to bathe in. It is not essential, but it gives better fertility. When the drakes are forced to tread on land they ofttimes slip and rotten eggs or dead germs result. Ducklings raised for market have water only to drink, and every precaution is taken to keep them out of it. A muddy or dirty duck will not thrive. Keep the pens as clean as possible. Feed the best and purest of foods, and be extremely careful not to have any sour food lying around, and keep their water absolutely pure and fresh.

Many succeed is raising a good duck only to spoil it by carelessness in preparing it for market. At Afton Farm they dry pick. Dry picked ducks bring a cent per pound more than scalded ducks. This is five cents per duck. The cost of picking dry is two cents per head over scalding. Thus there is a gain of three cents per head or six hundred dollars per year. Is it worth while?

The ducks to be killed are put six each in rows of pens 18 inches square. The picker comes to the pen, grabs a duck, sticks it in the throat and knocks it over the head with a club. The bird is thoroughly dead and the feathers loose. An expert picker will kill the bird instantly. This will leave the muscles that hold the feathers lax. When a bird dies slowly the muscles tighten and hold the feathers vise-like. As the picker walks to his seat he pulls out the tail feathers and throws them into a box provided. He sits down to his work, brushing most of the feathers off. He wets his hand in a basin of water and by experience knows just how and where to touch the duck to push the feathers off without damaging the flesh. Of course there are some he has to pull out and the pins and down he shaves off with a keen edged shoe-makers knife. The wing feathers are left on beyond the first joint and the neck is only picked about an inch from the body. The pickers pick fifty ducklings a day and do it right. They get six cents per duck. The feathers are carefully saved and about half pay for the picking.

After the picker has finished his duck he puts it into a tank of running artesian well water. Here they are left until an hour after the pickers have finished for the day, when they are counted out, head and feet washed and put into a tank of ice water. Here they remain until the next afternoon, at which time they are thoroughly chilled through and can be shipped on long journeys with little ice and arrive in good condition. Many make the mistake of cooling too rapidly. If you plunge a duck just killed into ice water it makes the surface suddenly very cold and the bird seems cold throughout. It is then rushed off to market, but arrives soft and flabby and sometimes slippery. You blame the commission man for not getting your full price when you shipped him the goods so they arrived in an inferior condition. Let's straighten ourselves out before we start on the commission man. We have found them as honest a lot of men as poultrymen are.

Have sandy or well drained land, comfortable houses, good vigorous breeders; feed plain, wholesome food; give them plenty of clear water to drink; keep their quarters clean and sanitary, attending to your duties at the right time, and you will find the duck business an excellent investment for your money.

The Feeding of Roots.

There are few foods for animals regarding which we find such a conflict of opinion as we do in the case of roots. Chemical anylysis shows about 90 per cent. of water in our leading root crops, and this fact is variously interpreted by those interested in feeding animals. Some claim that the water in roots is of no more value than the water in animal drinks, and that feeding roots is an expensive method of watering animals while others claim that the water in roots is different from ordinary water, and has an actual feeding value. As a rule, truth lies midway between extremes, and the present paper is an attempt to present a rational view of the question. Experiment stations have done considerable work with roots, and their findings are of importance in arriving at conclusions regarding the feeding value of roots.

In the first place, it may be noted that the Maine, Pennsylvania, Ohio, and Ontario Experiment Stations compared the yield of dry matter per acre from roots and corn. Maine obtained 3,415 lbs. of dry matter an acre from Swede turnips, and 5, 580 lbs. from fodder corn. Pennsylvania obtained 4,554 lbs. of dry matter an acre from mangels, and 6,763 lbs. an acre from corn; Ohio, 3,000 lbs. dry matter an acre from mangels, and 6,-080 lbs. from corn; and Ontario, 5,-034 lbs. dry matter from mangels, and 8,135 lbs. from corn. So far as yield of dry matter per acre is concerned it will be noted that corn shows a marked advantage over turnips and mangels. By dry matter is meant what is left after all the moisture of the product has been driven off by heat.

The Ohio Pennsylvania and Vermont Stations compared the dry matter of corn, silage and roots for milk production. The following table taken from "Feeds and Feeding," shows results from these trials:

MILK FROM 100 LBS. OF DRY MATTER IN CORN SILAGE AND ROOT RATIONS

Station	Root ration	Silage ration
Ohio, 1889	59 lbs.	62 lbs.
Ohio, 1890	59 "	60 "
Ohio, 1891	62 "	66 "
Ohio, 1892	69 "	76 "
Pennsylvania	87 "	82 "
Vermont	113 "	119 "

From the above table it will be seen that in every case but one, the dry matter in the rations containing silage proved more effective in the production of milk than in the dry matter in the rations containing roots. It is difficult to explain why such should be the case, unless the dry matter in the silage rations were underestimated. At the Central Experimental Farm turnips proved more expensive and not much more effective than corn silage for milk.

The Cornell Station found that one pound of dry matter in mangels is slightly superior to one pound of dry matter in corn silage. Also that one pound of dry matter in mangels is equal to one pound of dry matter in grain, and that mangels may replace half the grain ordinarily fed in a ration composed of grain, mixed hay and silage.

At the Copenhagen Station, very extensive trials go to show that one pound of concentrates in the form of grain, bran and oil cake is equal to 10 pounds of mangels. Also, that for cows, 1 lb. dry matter in roots is equal in feeding value to one pound of Indian corn, mixed grains, or three-quarters of a pound of cotton-seed meal. It was also shown that the water content of the milk was not increased by the liberal feeding of roots.

The results of tests quoted above are not exactly uniform, yet they all point to one thing, namely, that for dairy cows, the dry matter of roots is not materially different in feeding value from the dry matter in other foods.

At the Ontario Agricultural College roots have been fed in comparison with corn silage for fattening steers, and in all cases the roots did not make so good a showing, pound for pound, as silage. In one series of tests, silage showed 25 per cent. higher value a ton than roots, and in other tests the difference in favor of silage was greater.

A review of British methods of steer feeding shows a very heavy use of roots, as high as 150 lbs. per steer a day in some cases, accompanied by a comparatively light meal ration. The relatively low cost of labor in Britain and the high price of concentrated foods renders it advisable for the British farmers to use roots as a substitute for a large portion of the meal ration. In this country, such a practice would not be the most economical, more especially because we can raise corn for silage better than they can in Britain, and corn silage has been shown to be a cheaper food for fattening steers.

HORTICULTURE.

Executive of Hillcrest Orchards, Limited 1913-14.

The annual meeting of Hillcrest Orchards Ltd., was held at Middleton on Thursday, May 8th at which the following directors were appointed for the coming year:

Ralph S. Eaton, Kentville, N. S., President and Managing Director.

S. B. Chute, Berwick, N. S., Vice-President.

Mr. Chute is manager of the United Fruit Companies of Nova Scotia, and one of the largest individual growers in the province.

R. J. Messenger, Lawrencetown, N. S., Secretary-Treasurer.

Mr. Messenger is a graduate of Dalhousie University, was President of the Nova Scotia Fruit Growers' Association, 1911, Chairman of delegation to Second Dominion Fruit Conference at Ottawa, 1912, Lecturer at Short Courses Agricultural College, Truro, Farmers' Institute Speaker, and a large fruit grower.

E. E. Archibald, Wolfville, N. S.

Mr. Archibald is a Silver Medalist Royal Horticultutal Show, London, for boxed apples, and one of the most scientific fruit growers in the valley. He was President N. S. Fruit Growers' Association 1910.

Herbert Stairs, Wolfville, N. S.

Mr, Stairs is one of the largest fruit growers and one of the best known and most conscientious business men in the valley.

Mr. J. Rufus Starr, Starr's Point, N. S.

Mr. Starr was manager of Nova Scotia Horticultural Experiment Station, Kentville, 1911, has been a judge of fruit and stock at several county exhibitions, and has large orchard interests in Kings County, and is Ex-President of the N. S. Farmers' Association.

Captain F. A. Brown, Middleton, N. S.

Mr. Brown is President of South Far ington Fruit Company of Annapolis County, and has some forty acres of orchards of his own besides being interested in several other local enterprises.

In spite of it being the worst season for fruit in the valley since 1896 Hillcrest was able to clear up 4 per cent. profits on its year's business. When we consider that the apple trees average only 17 to 18 years of age and the profits of the last two years above all current expenses were 7½ per cent and 4 per cent as above, the shareholders may judge of the probable dividends in the near future.

Cutworms.

Cutworms are the most generally destructive garden caterpillars. There are many different species, but they look much alike and are similar in habit. They are most destructive in spring and early summer. Cutworms are naturally grass-feeding insects. The parent moths are the familiar "millers" that fly about lights at night. In early autumn these millers lay eggs among grass stems, and the eggs soon hatch into grayish or brownish worms, that eat the leaves of grasses and clovers. They feed for a few weeks before cold weather comes. By this time, they are, perhaps, half grown. Now they find such shelter as they can at the soil surface and remain through the winter.

In spring they come hungarily back to life and attack the grasses and clovers greedily. They continue to eat for several weeks. Then they are full-grown, smooth-bodied worms, an inch or more long, and are ready to change to the pupa state.

So the cutworms burrow into the soil a short distance, generally an inch or less. Here each wriggles around to form an oval cell. Then it casts off its larval skin and changes to a brown pupa. About two weeks later the pupa wriggles into the soil surface, the brown skin splits open, and the moth comes forth. This moth is like the "miller" that laid the eggs in grass land so many months before.

This is the life history when the cutworm remains in the grass land throughout its life as a larva. But very often the grass is plowed under in fall or spring and there are no grasses or clovers for the hungry larvae in spring. They must eat or starve, and so they wander around over the bare soil until they come to some garden plants, young peas or corn or cabbages. They attack the stems of these and cut them off with their sharp jaws, swallowing the green tissues greedily. After the plants have fallen they may eat part of them, although they seldom eat them completely.

In case the grass ground where the cutworms have been feeding is next to a garden or field, the insects often wander over the latter in search of food. Small gardens surrounded by grasslands are especially liable to cutworm injury. In setting out tomatoes, cabbages or other vegetables in such gardens it is generally worth while to tie a bit of pasteboard 2 or 3 inches high about each stem. This serves as a collar that prevents cutworm injury

COMBATING IN A LARGE WAY.

In fields liable to injury by cutworms the poisoned bait treatment is effective. The bait is made by mixing ¼ pound sugar or a small quantity of cheap molasses with about a pound of bran. Stir these up in a gallon of water to make a rather thick mash. Now stir in an ounce or two of arsenate of lead or paris green, mixing the poison thoroughly with the bran.

This bait should be scattered in little piles, about a heaping tablespoonful, over the harrowed field. If placed on immediately after planting to corn it will be likely to do much good by killing the worms before the corn is attacked.

Another effective bait to use in the field is made by spraying freshly cut clover with poison or dipping bunches of the leafy stems in a mixture of arsenate of lead and water. Such leaves scattered over the field after harrowing will be eaten by the cutworms. I find this very effective.

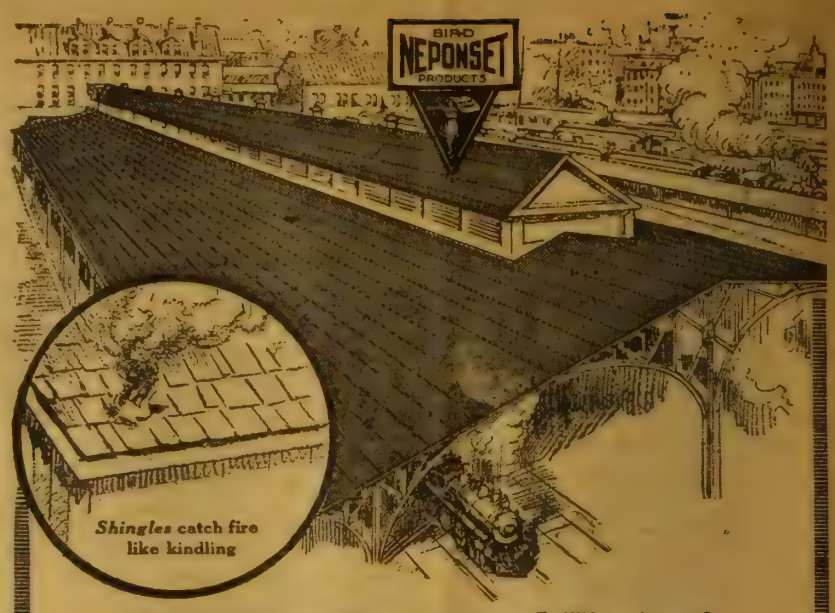
Care must, of course, be taken that chickens do not eat the mash bait, or sheep, calves or other animals the clover bait. After a few days either may be cultivated or harrowed into the soi,.

Conserving Soil Moisture.

Unless cultivation be given promptly after each shower of any consequence crops are apt to suffer faster than you suspect. It is often remarked and with a great deal of truth too, that "showers" cause soils to dry out rapidly. This is true under certain conditions, but it is not the whole truth.

As a matter of fact when there is a good mulch on the surface soil and just enough rain to wet this but not enough to cause the "moisture to meet," unless cultivation be soon given and the mulch reestablished, capillarity will be greatly accelerated and an enormous amount of moisture be lost. The damp surface soil starts the upward movement of the soil moisture and since the surface mulch has been made firm and established connection with the lower layers of moist soil, moisture is rapidly evaporated on the surface of the soil and lost so far as the crops are concerned.

To obviate this cultivate promptly, reestablish a mulch and thus sever the connecting tubes or capillary movement of moisture to the surface. This will cause the moisture to rise to the lower level of the mulch, but the mulch serpes as a "blanket" to



This Roofing Used Twice!

Most roofs have but "one life." This roof pictured above had "two lives." When the Old Wells Street Station of the Chicago and Northwestern R. R. in Chicago was torn down, its roof of NEPONSET **Paroid,** after fighting smoke, burning cinders and storm for eight years, was rolled up and used to roof other stations.

It's still giving perfect service. NEPONSET **Paroid Roofing** is constantly doing this—giving better, longer and safer service than you would think it possible for any roofing to give.

"Covered with NEPONSET **Paroid**" means that you have protected your stock, implements, grain, etc., with the safest, sanest and surest product which the development of prepared roofing affords. It's a quality product. Anyone can lay it.

NEPONSET

Waterproof Building Products

Roofings

NEPONSET roofings are a fire protection, leak-proof and long lived. Anyone can lay them. NEPONSET Paroid Roofing is for general use. NEPONSET Proslate Roofing is an ornamental roofing for dwellings. Attractive colors.

Building Papers

If NEPONSET Waterproof Building Papers are built into walls and floors, the building will be warmer, will cost less to heat and will last years longer. Recommended by architects, engineers and building owners everywhere.

Wall Board

NEPONSET Wall Board is a scientific product which takes the place of lath and plaster; comes in sheets 32 inches wide. Remember, it is the only wall board with waterproofed surfaces that requires no further decoration. Anyone can put it up.

Are you going to build? Write for more facts about the products in which you are interested. Send for samples, free booklet and name of nearest NEPONSET dealer

It Needs No Painting

Amatite ROOFING

THE superiority of Amatite over all other ready roofing is apparent to anyone who uses it.

Amatite does away with all roofing troubles and unnecessary expenses because it is made with a real mineral surface which *needs no painting.*

It is durable, fire retardant, practical, economical.

Don't buy any other roofing till you look up Amatite. Write to nearest office for samples.

Creonoid *Lice Destroyer and Cow Spray*

Creonoid sprayed on cows keeps away flies. Use it before milking and cows will yield better.

Everjet Elastic Paint

Save money by using this black paint wherever the color is no objection. Elastic, heat-proof, durable. Use it for "rubber" roofings and all exposed iron and wood.

A sprained ankle may as a rule be cured in from three to four days by applying Chamberlain's Liniment and observing the directions with each bottle. For sale by all dealers.

keep the moisture from coming to the outer surface where it would evaporate and be lost to crops.

Soils that are tenacious require especial promptness and care in cultivation for they are easily "packed" and "crusted" and hence unless cultivated at the right time after rains lose much moisture and may be in a condition that future cultivation will be greatly handicapped. A light sandy soil retains the mulch longer and, as a rule, is not so rigid in its requirements for cultivation after showers. A sandy soil does not "pack" and for this reason does not lose moisture so rapidly.

As a rule the finer the soil particles the faster moisture will move under the law of capillarity, but the slower will be the rate of percolation, or downward movement under the law of gravitation. This means that soil that have fine particles of clay, clay-loam, "buckshot," etc., will require more cultivation than sandy or loam soils, but will when cultivated properly retain the moisture longer.

The point to remember is that we must study our own soils and learn to manage them economically.

Watch for Noxious Weeds.

The greatest care should be taken to keep weeds from producing seeds on the farm, in the orchard or in the garden. Not all weeds are pernicious pests but many of them are. All of them cost money to destroy and every weed plant that bears seeds is increasing your expense for cultivation.

During the busy season the turn rows are apt to be neglected and before one is fully aware of it weeds have made a start. It is then only a few weeks more until there are millions of seeds to propagate the species and thus your labor and expenses are increased.

Years ago when the old rail-fence was used, the corners of the fence were a hot-bed breeding place for noxious weeds. These not only caused an unsightly appearance, but they usurped moisture and plant food that crops needed and what is more serious produced seeds to propagate the species and thus contaminate the fields. There are yet in some locations a few rail fences and the greatest care should be used in keeping the corners clean.

On many farms there are sloughs, breaks, slashes or other places that for various reasons can not be cultivated. The farmer should see to it that these places do not breed weeds to cause him trouble and expense. Usually such places can be utilized so that they will not breed weeds, but on the contrary produce something that the farmer or his stock can consume.

Marking Imported Fruit.

Hon. Martin Burell, Dominion Minister of Agriculture, has given notice of an amendment to the Inspection of Sales Act of 1906 to provide that the Governor-in-Council may prescribe the kinds of imported fruit, the packages containing which must be branded or marked, the marks to be used thereon and the manner and places in and at which such fruit is to be inspected and such packages branded and marked.

All packages of fruit not branded or marked in accordance with such regulations are to be forfeited. Persons violating any regulation will be liable to a fine of not more than fifty dollars and costs.

DAIRYING.

Why Send Cream Instead of Milk?

Progressive farmers re beginning to appreciate the advantages of separating milk on the farm in preference to sending the whole-milk to a creamery. Each year more separators are introduced on farms and a greater number of farmers do the separating at home and deliver the cream to its destination.

When a creamery is patronized and the whole-milk is delivered, there is a needless haul of large quantities of milk both ways. For example, if the daily output is 300 pounds and whole-milk is delivered, this quantity must be hauled to the creamery. Here it is separated and about 40 pounds of cream is removed. The skim-milk, about 240 pounds, must be hauled back home again. Thus in order to deliver only 40 pounds of cream, the the farmer must haul both ways the total amount of milk.

When it is separated on the farm, the skim-milk has a greater feeding value for the calves. Then it can be fed to them while it is yet warm with the original animal heat. The milk is always sweet, being only a few hours old. When one has to depend upon that brought from a creamery, there is always more or less trouble with sour milk, especially in hot weather. It is not available for feeding until the return trip from the creamery is made. This delays the morning feed and as half of the milk is held over until night this is often sour.

When whole-milk is delivered to a creamery, one may not get a correct test of the milk. After cream has set once on the milk it is difficult for the buttermaker to get a representative sample. Unless it is most thoroughly mixed at the creamery, the sample for testing is apt to be either too low or too high in butter-fat. When cream is delivered there is less danger of making this error.

Another reason in favor of delivering cream is the time saved both going to and from the creamery and in not having to wait one's turn at the creamery for the milk to be weighed. Every one, who has had experience in drawing milk, knows what it is to wait in line behind a dozen or more milk wagons for an hour or more and then often have to wait again in line for the separgted milk to take home. When cream is delivered one can drive up to a side door with a small can of cream and it is received without any waiting on the part of the farmer. On account of the several hundred pounds lighter load which can be taken in a buggy, quicker time can be made in going back and forth. This saving, when one's time and the horses are needed for pressing farm work, is an important consideration.

The practice of sending cream is becoming more popular each year. Farm separators have been perfected, so that the work can be done easily and quickly. The separators are durable, easily taken care of and are valuable machines for each dairy farm.—Lynford J. Haynes in Kimball's Dairy Farmer.

Satisfactory Guernsey Records.

The Guernseys continue to demonstrate by actual test that they are producers.

Recently a number of cows owned by some of the leading Guernsey breeders of Eastern Canada have made the following very satisfactory records and have qualified in the Canadian Record of Performance.

"Berwick Queen Bud" four years old, owned by John N. Chute, Berwick, N. S., produced in 12 months 9119.5 lbs. milk, 421.163 lbs. fat.

In the herd of D. G. MacKay and Son, Heath Bell, N. S., three have qualified:

"Flora's Heiress" mature cow produced 8107 lbs. milk, 418.257 lbs. fat.

"Heiress Daisy" two-year-old produced 6318.5 lbs. milk, 282.586 lbs. fat.

"Lady Pauline 2nd," of Spruce Grove, two-years-old produced 6121 lbs. milk, 359.54 lbs. fat.

Two heifers in the three-year-old class owned by Hugh A. Dickson, Central Onslow, made good records as follows:

"Gipsy of Willow" three-year-old produced 7852.3 lbs. milk, 368.668 fat.

"Beauty's Belle" three-year-old produced 8540.25 lbs. milk, 466.864 lbs. fat.

The six cows whose records appear above consist of one mature cow, one four-year-old cow, two three-year-old and two-year-old heifers; their average production is nearly 8000 lbs milk each, and 386.082 lbs. fat or 450.429 lbs. commercial butter. Their average butter fat test is above 5 per cent.

What more convincing evidence do the Guernseys need to demonstrate their ability to produce?—Howard W. Corning, Secretary Canadian Guernsey Breeders' Association, Chigoggin, N. S.

The Shape of the Udder.

Among the leading attributes sought for in a good dairy cow, both from a show point of view and that of ordinary practical utility, there is none which is deemed of more vital importance than the possession of a well-developed and shapely udder. The key-note of a good milk vessel should in all cases be capaciousness, for this, more than anything else, constitutes a sign of milkiness, and formerly a large size was usually considered to be practically the only criterion that really mattered; but with the high standard of perfection which has now adays come to be looked for as regards the shape of this organ—in consequence of the increased attention which breeders have latterly bestowed upon improving it—there are several other very exacting requirements which it must fulfil if it is to pass muster satisfactorily. Mere expansiveness in itself in no wise means a good udder, and there are various faults of shape, etc., which may utterly mar even the largest bag.

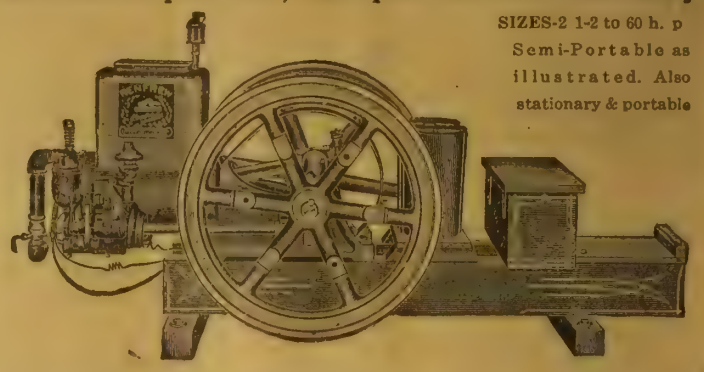
SYMMETRY.

Next to possessing the necessary capacity, the great thing is that the udder should be symmetrical and well-proportioned, hanging down evenly and squarely, showing an equal degree of development in the fore and hind quarters, having a broad, flat sole, and with teats placed well apart. That the sole (i. e., the bottom of the bag) should be as broad and level as possible is probably the most important detail as regards the question of shape. A sole such as described imparts a symmetrical underline to the vessel, but it is by no no means a mere fancy point, for it is most desirable, also, from a utilitarian aspect, inasmuch as it goes materially to enhance the capaciousness of the organ. Two other leading points to look for are that the udder should extend well forward under the belly, and be carried high up behind between the thighs, while the back of the bag, as seen when one is standing in rear of the cow, should look wide and full, and the more it bulges outwards at the back when filled with milk the better. A very full, outward curve behind is a point of special attraction, and this is seen in the greatest perfection most often among well-bred Jersey cows. It is a bad fault if the udder shows a narrow or attenuated formation when viewed from behind, for a vessel of this shape cannot really be capacious however pendulous it may be.

Perhaps the most common fault of shape seen in the udders of dairy cows, and more particularly so in those of Shorthorn breed or which are of Shorthorn descent, is that of the fore-udder—that is, anterior half of the bag—not being sufficiently well developed in proportion to the rest of the organ. The symmetry of the vessel is utterly spoiled in this case, for, instead of its coming down squarely in front, as it should do, which insures a full form and level sole, it slopes away or recedes, imparting a shapeless and unbalanced appearance to the whole, while it naturally also reduces the bag's capacity. Breeders of dairy cattle will do well to concentrate some special attention upon the elimination of this defect from their strains. It is averred by some that a certain degree of improvement may be artificially brought about in the shape of the bag of a young cow, when her fore-udder is not full enough, by plentifully massaging this part, and by pulling the two front teats, as if the cow is being milked, for a short time after every milking. It is quite probable that these manuipulations may have some effect in stimulating the development of the interior portion of the vessel, when done to young cows which have produced their first and second calf, and in which the udder has not yet attained its full development. But it is very doubtful whether the results produced by such a course of treatment will improve the shape of the bag to a perceptible extent, and to be worth the trouble which it entails. In mature cows this treatment would, in any case, be quite ineffectual.

Here Is The Engine They're Talking About

All sizes in portable, semi-portable and stationary



SIZES-2 1-2 to 60 h. p Semi-Portable as illustrated. Also stationary & portable

Today, the sensation in the Canadian gasoline engine field is the success of the Renfrew-Standard Engine. People started talking about the

Renfrew-Standard

when they saw it at the Big Fairs last autumn. Here was an engine that started without cranking—that was so perfectly balanced it did not need to be anchored down—that had a governor of the flyball steam engine type—that had a remarkably simple carbureter—that had no pipes, fittings, cooling pumps or fans to freeze or get out of order. Was it any wonder that people talked?

It will set you talking too when you see it. You'll want one right away. That seems to be the case with everyone, judging by the way our sales are increasing by leaps and bounds. Write for our engine bulletin and name of nearest agent.

Better Butter And Better Prices

These are the two big reasons why you should use Windsor Dairy Salt.

If you make your living out of the butter you sell, then anything that will make the butter better will make more money for you.

WINDSOR DAIRY SALT

has proved its quality and superiority in thousands of dairies and in hundreds of contests.

Successful creamery men have used and are still using Windsor Dairy Salt—because it gives them the best results always.

Are YOU using it? 71D

To Women Who Dread Motherhood

Information How They May Give Birth to Happy, Healthy, Children Absolutely Without Fear of Pain—SENT FREE.

No woman need any longer dread the pains of childbirth. Dr. J. H. Dye devoted his life to relieving the sorrows of women. He has proven that the pain at childbirth need no longer be feared by woman and we will gladly tell you how it may be done absolutely free of charge. Send your name and address to Dr. J. H. Dye Medical Institute, Canadian branch, Dept. 110 St. Mary's, Ont., and we will send you, postpaid, his wonderful book which tells how to give birth to happy, healthy children, absolutely without fear of pain, also how to become a mother. Do not delay but write TO-DAY.

No Summer Vacation

We would greatly enjoy one, but as many of our students come from long distances and are anxious to be ready for situations as soon as possible, our classes will continue without interruption.

Then, St. John's cool summer weather makes study during the warmest weather just as pleasant as at any other time.

Students can enter at any time.

Say I Saw It in The FARMER

THE TEATS.

To come finally to the teats. Both the way in which these appendages are set on and their shape are points to be taken into consideration. They should be placed wide apart, especially the front pair from the hind one, and they should hang perpendicularly from the soil, being set on quite low. Very often the teats are placed too high, and project from the sides of the bag rather than from its sole. Such a position is faulty, and looks bad. In this case they will also frequently straddle more or less outwards, instead of hanging in a perpendicular position, which is another defect. But the worst fault, as regards the teats, is for them to be unduly close together—a position usually described as "bunched together." This defect is very commonly associated with a poorly shaped and insufficiently developed udder, and more often than not it is the mark of a bad-milking cow. It practically never occurs in well-shaped milk vessels. The more cylindrical in form the teats are the better, and they should be of medium size. In the Jersey and Ayrshire breeds they are, in fact, preferred small, and in the latter breed especially a very small teat is fashionable, though it is not the most practical. Very big fleshy teats are ungainly, and constitute a sign of coarseness. Sometimes the teats are very puffy or swollen-looking and thick at the base, while tapering much towards the end; these are known as windy teats. This is deemed a most unsightly defect, and it quite mars the appearance of an otherwise shapely vessel. As cows get older their teats very often lose their original good shape, and become larger and coarser, and this fact should always be duly allowed for in sizing up the udder.—F.

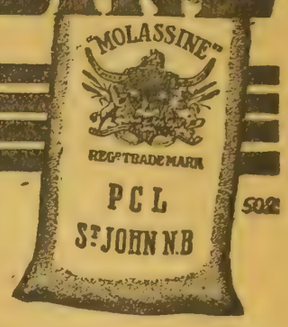
The Art of Milking.

The art of milking is considered as being on a level with pumping water, or any other simple work, and yet there are many points needed to stamp a man as a good milker. Too many children are allowed to attend to this important work and many of the chronic troubles of cheese and the cheese factory originate here.

A good experienced milker can soon tell if there is something wrong with the udder and milk, and will not allow such milk to be delivered to the factory, but what can you expect of a child? Cleanliness is absolutely necessary to success in the factory. Everybody knows this and yet you can notice cows being milked that have udders covered with dirt, mainly caused by the swamp-like condition of some of the barnyards.

Do the milk utensils always get proper care? Are they properly washed with hot water and kept in proper places? Are they used exclusively for their purpose alone? I think not, or else the collection of things of all variations delivered with the milk would not be so large as it is. It seems to me that it would be a step in the right direction if we would follow the example of the dairy farmers of Switzerland, who arrange milk courses every year, where the proper care of cow and the milking is taught in all its important details. We certainly need something of this kind.

MOLASSINE MEAL



is as good as pasture all the year round. Your horses, milch cows, steers, pigs and sheep will be in the pink of condition in the spring and can be turned on grass without any loss if fed regularly with MOLASSINE MEAL through the winter.

This Fence Has Vast Strength

For a fourth less than the price we pay, we could get hard-drawn steel wire. But that kind, though used in most other wire fence, hasn't the *life*, the springiness, the strength we insist on for Maritime Wire Fence.

• • • •

So we make this fence of extra-heavy hard drawn steel wire of nine-gauge. Constantly we test it for quality. And so we *know* this fence has *more* strength than it probably will ever need.

• • • •

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime Fence is far longer—and the fence surely reliable.

• • • • •

On this extra-quality wire we put a smooth, even heavy coat of galvanizing. We put on more than enough—that's our way. You gain by the longer life of this better fence. And we lock laterals and upright wire rigidly, yet springily, with a cross-leverage lock that simply CANNOT let go under the hardest strain.

• • • •

You can bank on the strength of this fence Make the test for yourself and your neighbors. Then get the agency—it will pay you well. Address

MARITIME WIRE FENCE

Protect Your Property With Peerless Lawn Fencing

Ornamental fencing serves a double purpose. It not only enhances the beauty of your premises, but also protects it and your children, as well. It keeps out marauding animals and trespassers. It protects your lawns and flowers and always gives your property that orderly, pleasing appearance.

Peerless Ornamental Fencing

is the result of years of fence building. It is built to last—to retain its beauty and grace for years to come and should not be confused with the cheap, shoddy fencing offered by catalog houses. Peerless fence is built of strong, stiff wire which will not sag and the heavy galvanizing plus the heavy zinc enamel is the best possible assurance against rust.

Mammary Inflammation in Sows.

The causes of the inflamed condition of the udder in sows, resulting in cessation of milk secretion, and commonly in the death of the offspring, with great pain and loss of condition in the sow, often miscalled "milk fever," are varied, but the most fertile is injudicious feeding and management prior to and immediately after farrowing. Cold and exposure, and lack of attention to cleanliness are said to be causes, and so, no doubt, they are in some cases, and they should certainly be provided against; but we are quite convinced that the most common cause is the well-intentioned practice of feeding sows highly before they farrow, with a view of forcing the milk, or in stuffing them with all the rich, stimulating, milk-producing food they will take as soon as the pigs are born—of course, with a like object. This feeding for milk is laudable enough if practised at the right time; indeed, it is essential to the vigor and quick growth of the pigs; but it is a poor sort of sow, and one that should not have a place in a breeding herd, that does not produce enough milk for her offspring during the first few days of their existence on very ordinary fare. Experience goes to show that the sows most likely to suffer from so called "milk fever" directly after farrowing are those that have large pendent mammae, and normally give a large quantity of milk—popularly recognized as "good mothers"—and that have been highly fed as the date of parturition approaches in order that the supply of milk may be abundant The quantity secreted is larger than the newly-born pigs require, or can take, and as they cannot get it away fast enough, the teats become what the pigman calls "caked," the gland structure swollen and hard, and in flammation results from retention. There is also every reason to believe that high feeding and insufficient exercise, with which is generally associated constipation, during the closing days of gestation, and continued, as regards the former, immediately after farrowing, induce a feverish condition of body which accounts for many of the cases of sudden stoppage of secretion or "drying-up" of the milk, concerning which complaints are common, especially among breeders lacking proper convenience for this branch of pig-keeping, and whose sows are kept entirely in confinement, and often in very restricted quarters at that. We rarely come across one of these cases of loss of milk and difficulty of dealing with the practically orphaned little pigs, but that investigation shows that the sow has been highly fed in order that she might produce plenty of milk for them.

INJUDICIOUS FEEDING FOR MILK

It should be obvious that young pigs at birth, and for several days after, do not want, and cannot take, the quantity of milk they require as they get older and bigger. Yet a great many begin at once to feed their sows as though the very existence of the young pigs depended on it. Their existence is, on the contrary, often imperiled by it, for when the sow loses her milk when they are a few days old, the bringing of them up by hand is difficult, often a failure, and always troublesome and unprofitable. All large breeders of experience deprecate high feeding as parturition approaches and immediately afterwards, and recommend that in-pig sows should not be kept in too high condition. Needless to say, there is a vast difference between having a sow so fat that she can hardly wadle and having her farrowing down in a state of weakness due to a poor or insufficient food. The happy medium —that best described as "nice breeding condition"—is what should be aimed at.

VEGETABLE FEEDING

A grass run, supplemented by a few beans, peas, or other dry grain is the ideal place for the in-pig sow, but everyone who breeds pigs has not a suitable place for his sows to run out —those who have often neglect to use it—and in these circumstances vegetable food, with a little mixed meal, should form the diet until within a week or so of farrowing, when roots, and especially mangels, should be stopped, and sharps substituted. The same kind of feeding, with a little bran added, should be continued for a month after farrowing. All the time better results are obtained by teaching the youngsters to eat early than by overfeeding their mother with heating foods.

TREATMENT OF INFLAMMATION.

When, soon after farrowing, the mammae of the sow are found to be red, hot, full, hard, and tender to touch, so tender that she refuses to let the pigs suck—the first thing to be done is to give a saline aperient, which it may be necessary to repeat several times in smaller doses as a febrifuge. A full dose of Epsom salts in combination with nitrate of potash is as good as anything that can be given. If fever runs high, and there is much constitutional disturbance, as there generally is in bad cases, tincture of aconite should be given in small doses at intervals of two hours until the temperature falls. Local treatment should consist in free fomentation with hot water—it is practically impossible to poultice as in the case of the cow—followed by careful drying, and gentle rubbing or working with the hands—call it massage—using camphor ointment or camphorated oil as a lubricant. Where the udders are much swollen and very painful, an ointment or lotion containing extract of bella-donna, which any chemist will supply, is excellent for relieving the tension. Complete recovery is, unfortunately, the least common result of mammary inflammaeion, and animals that have suffered from it are generally best fattened out for the butcher. In any case where there is induration or atrophy of any of the udders, or blind teats, no attempt should be made to breed from the animal again, or there will inevitably be trouble at the next farrowing. There is invariably a necessity for removing the pigs, but how to deal with them is another story.—Pately Bridge in Farm and Home.

WILSON'S FLY PAD. POISON

Good housekeepers commence using Wilson's Fly Pads early in the season. **Do it now.** You will not kill many, but every one represents thousands that would infest your home later on.

Ox Warble Flies.

The ox warbles or bots (Hypoderma bovis Geer and Hypoderma lineata Villers) belong to the Diptera family Oestridae. Both are found in Europe. According to Railliet, H. bovis is also found in Asia and Africa. Up to now only H. lineata has been met with in North America. According to a communication from the Government of the Commonwealth of Australia, that continent is free from warble flies. On imported cattle in some cases warbles were observed, but the animals were quarantined and the larvae destroyed.

HOW THE EGGS ARE DEPOSITED.

An official of the United States Bureau of Animal Industry observed that the female of H. lineata deposited its eggs, about 1 mm. in length, by means of a blunt ovipositor on the hair of the cattle, most frequently preferring the hair of the forelegs. As many as six eggs have been found on one hair. Every egg has an appendage, which adheres to the hair. The eggs contain fully developed young larvae. Egg-laying takes place during the warmest part of the year. Cooper Curtice found in 1890 young larvae of H. lineata in the throat of cattle, and it is probable that the eggs are licked off by the animals and thus find their way into the cavity of the mouth, where the larvae hatch out. They migrate thence into the muscular tissue of the gullet and moult after some time. Later, in the winter months, warble larvae are found in the adipose tissue of the spinal cavity and towards spring they appear under the skin. Here they moult twice, producing abscesses. They bore an aperture through the skin, which at first serves for the introduction of air; then, when they have completed the bot or maggot stage, as a passage by which they leave their host. They then fall to the ground on which, or just under the surface, they turn to pupae and emerge, after from three to six weeks, as perfect sexually mature flies. In the Southern States of the United States the first warble flies appear in the spring; in Europe their appear-

NEXT TO CONSUMPTION

THERE ARE MORE DEATHS

From PNEUMONIA

Than Any Other Lung Trouble.

Pneumonia is nothing more or less than what used to be called "Inflammation of the Lungs."

Consumption may be contracted from others, but as a rule pneumonia is caused by exposure to cold and wet, and if the cold is not attended to immediately serious results are liable to follow.

There is only one way to prevent pneumonia and that is to cure the cold on its first appearance.

Dr. Wood's Norway Pine Syrup will do this for you if you will only take it in time.

Dr. Wood's Norway Pine Syrup contains all the essence and lung healing powers of the famous Norway Pine tree.

Mr. Hugh McLeod, Esterhazy, Sask., writes:—"My little boy took a very severe cold, and it developed into pneumonia. The doctor said he could not live. I got some of your Dr. Wood's Norway Pine Syrup, and he began to improve. Now he is a strong healthy child, and shows no sign of it ever coming back."

The price of this remedy is 25 and 50 cents per bottle. It is put up in a yellow wrapper; 3 pine trees the trade mark; and is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Annapolis Valley Fruit Farm

Overlooking the Minas Basin

62 acres with 475 choice apple trees, a splendid opportunity to develop large commercial orchard; 55 acres machine-worked tillage; splendid 9-room house with 36-ft. piazza; barn with tie-up for 12 head; carriage house; owner a merchant has not use for the farm; located in a thrifty town where in a few years farm will cut into bldg. lots; going now for only $5300, part cash; for full details and traveling instructions to see this and other farms in many different sections, see page 67, our "New Mammoth 75-Page Farm Catalogue No. 36"; beautifully illustrated and filled with a wonderful assortment of money-making farms; send today for your free copy, it will save you lots of time and money,—Box D, Sussex, N. B.

ance is limited to the summer months from June to August. The fully developed warble fly has only rudimentary mouth paths; it consequently takes no food and lives but a short time.

What has been said of H. lineata holds good for H. bovis, with the exception that until lately no investigator had been able to ascertain whether this oestrid also laid its eggs on the hair of cattle and which part of the animal it preferred. In the summer of 1912, Glaser, however, was enabled to observe an unfecundated female of H. bovis laying eggs. He set the fly on the back of a bull, and saw after some time that this fly drove its ovipositor into the coat of the animal. He then found, on a spot about half a square centimetre in extent, eight eggs, and on another, about one square centimetre, upon which the fly had also stopped, six eggs adhering to the hair on the back of the bull, and rather close to the skin. The eggs were visible only when the hair was rubbed the wrong way. According to this observation it is very probable that under natural conditions normally developed and fecundated females of H. bovis lay their eggs on the coats of cattle, and, like H. lineata, attach them to the hairs. In support of this view is the fact that the eggs of both species are provided with an appendage which serves for fastening the eggs to the hair. Carpenter supposes that H. bovis also lays its eggs by preference on the hair of the feet, because he observed that in Ireland warble flies swarmed especially round the feet of animals.

Opinions are still divided as to how the larvae of H. bovis find their way into the body of the cattle. Hinrichsen had (according to Railliet) already in 1884 discovered larvae of these flies in the throats of cattle. Other investigators have found larvae in the midribb, in the spinal cavity, and in the muscular tissue under the skin. Stub sets up the theory that the larvae found in the throat do not attain full development, but perish in the body of the animal. According to him the larvae of H. bovis can only develop normally when they have bored a passage through the skin from the outside. Peter is of opinion that the larvae enter the animal by the gullet, bore through the hide from the inside as far as the roots of the hairs, and from this point to the outside the opening is completed indirectly by inflammatory processes. In support he gives several figures showing cross sections and a longitudinal section of such passages.

PROTECTIVE EXPERIMENTS.

Carpenter has been conducting experiments for some years past in Ireland with the object of ascertaining how Hypoderma larvae enter the bodies of cattle. He kept during the year 1904 and 1905 four calves always covered with a cloth together with other calves on the pasture; in the summer of 1905 four other calves were provided with coverings for their limbs also, and further six calves completely covered were kept on the pasture. Of these only one lived to the next spring. The average number of warbles found on the calves protected by clothing differed very little from that found on the unprotected animals. Only the completely clothed surviving calf was found in spring to be quite free from the larvae. (At the last counting of the larvae in May it was not possible to ascertain with certainty which of the calves had been completely clothed during the preceding year.)

In the summers of 1906, 1907, 1908 and 1909 Carpenter provided several calves with leather muzzles and kept them with other calves on a pasture. The muzzles were to prevent the calves from licking themselves and thus affording warble larvae of their eggs the means of passing through the calves' mouths into their bodies. During the night, and whilst feeding their necks were fastened in such a manner to a kind of wooden frame that the animals could not lick themselves, besides which, the forelegs were clothed. Nevertheless, in the spring of 1907 five of these muzzled calves had ten to twenty-seven warble larvae on them; only one was completely free. Two calves which had worn muzzles in 1907 bore no warbles in 1908. In the summer of 1908 other six calves were kept muzzled on pasture. Instead of clothing their forelegs, a kind of apron formed by a sack was hung around the animals' necks to prevent them from licking their forelegs. The above-mentioned wooden frame was also used. In spite of these measures, in the following spring, all the protected calves had an average of 4.66 warbles, against an average of 4.33 warbles on the nine unmuzzled control calves. In the summer of 1909 five muzzled calves were kept on the pasture. Over the leather muzzle a large wire one was placed so as to prevent the calves taking up larvae through the openings in the leather muzzle. The other precautions were the same as had been previously taken. Together with these five calves fifteen control calves were sent into the same pasture. Each of these latter calves had in the spring of 1910 an average of 6.33 warbles. Threee of the muzzled calves had only one warble each, one had three and one had four. Carpenter adds that by means of the double muzzle at least a partial protection against the larvae was obtained. The results would probably have been better if the wire muzzles had been immediately used with the leather ones. But the former arrived only at the end of May, so that the calves were protected during the very warm last week in May only by the leather muzzles. Carpenter is continuing his experiments.

INJURY CAUSED BY WARBLE FLIES.

There can be no doubt that warble flies injure cattle in various ways. In the first place, their presence disturbs grazing cattle. The injury that the animals suffer from the larvae can consist in lower milk yield and in the depreciation of their flesh and hides. The loss in milk is valued by some as high as 20 per cent. but this estimation cannot be accurately checked. The injury to the flesh consists in the inflammatory modifications it undergoes in consequence of the presence of the presence of the larvae; the inflammation is revealed by the effusion of serum in the connective tissue and renders the meat unsightly; so-called "licked beef." The most mischief is that done to hides. Krause calculated that in 1910 about 24 per cent. of all the hides in Germany were damaged by warbles. The total number of damaged skins amounted to 941,994—a total loss in Germany of £178,142 8s. The English Board of Agriculture was informed by a tannery that out of 132,000 hides which had been worked, 40,000 were damaged by warbles. In another tannery only 1,500 hides out of 20,000 were damaged. The depreciation amounted to from 2s. 6d. to 5s.

From the United States no recent figures are available. In Canada warble infection is especially considerable in the provinces of Manitoba, Saskatchewan and Alberta. It is customery to reduce the purchase price by two dollars for every head of cattle found suffering from warbles.

DESTRUCTION OF WARBLE FLIES

This has not hitherto been rendered compulsory by legislation in any country except the German State of Oldenburg. In Great Britain, Belgium, Switzerland, Austria, the United States and Canada official action has hitherto been limited to instructing farmers by means of publications on warble flies. The State Entomologist for Queensland has psoposed to the Australian Government to render the Commonwealth Quarantine Act more stringent in respect to cattle affected by warbles. The Government will take an amendment of the quarantine measures into consideration.—"Bulletin of the International Institute of Agriculture."

An Insect Injurious to Cattle Raising

Cattle raisers in almost all parts of Canada are familiar with the small lumps that appear on the backs of their animals during the winter months and from which white grubs or maggots emerge at a later date. Many theories exist as to the exact life history of the insect, known as the Warble Fly, of which the white grub is the larva. The opinion generally held that the eggs are laid on the backs of the cattle, and when hatched work their way beneath the skin, is proved by careful investigation to be incorrect. Dr. Seymour Hadwin, 1st. Assistant Pathologist of the Health of Animals Branch of the Dominion Department of Agriculture, who has studied the subject, claims that the eggs are not laid on the back but on the legs of the cattle. This appears to bear out the theory that the newly hatched insects are licked by the animals and thus taken into the system and ultimately find their way to the backs where they develop beneath the skin.

The matter of chief importance to the cattle raiser is not the exact course taken by the insect within the body of the cattle beast but rather the economic effect of the grubs upon the business of cattle raising. To throw light on this phase of the subject Dr. Hadwin has written a bulletin, which is numbered 16 of the Health of Animals Branch, dealing with the economical aspect of warble flies. In this it is shown that enormous losses occur each year through damage to hides caused by these insects. Tanners consulted on the subject claim that during the "grubby season," extending from January to July, from 25 to 75 per cent of hides are warbled and that about 20 per cent of Canadian hides are more or less damaged. The extent of damage is variously estimated by 16 large tanners to be from about 50 cents to $1.00 per hide; the estimate of one Ontario tanner was 10 per cent which is equal to $180.000 per annum. The author observes that the man who undoubtedly loses is the farmer; the tanner does not want warbled hides at any price and several of them testify that they buy hides only during the season when hides are not grubby. He estimates the annual loss to be between 25 and 30 per cent.

This bulletin of twenty pages, which is the first to have been issued on the subject in Canada, is helpfully illustrated. Copies will be made in response to applications made for it to the Publications Branch of the Department of Agriculture at Ottawa.

FARMS FOR SALE!

Englishman, farming in America must through trouble sell two of his farms. One of 67 acres, suitable dairying, poultry, fruit; good land, house, barn, outbuildings, large orchard; near school, church, electric cars, telephone, stores. Mail delivered. Beautiful healthy country, fishing, shooting, good cash markets; Butter, now 35c.; eggs, 25c.; hay, $18.00, etc. Sacrifice for $2000, half down. Investigation invited. Also portion of home farm of 250 acres, about 170 acres, with good 10 roomed house, furnace heat, 90 ft. barn, icehouse, implement sheds, etc., productive orchards, large fields. $4000. Easy terms. CHAS. ELVIN, Winthrop, Maine, United States.

Annapolis Valley Orchard

75 Acres, 600 Apple Trees

Fine chance for large commercial orchard; 30 acres used for tillage; brook pasture for 10 cows; 15 acres wood and timber; cellar; stable, granary; etc.; owner's other business forces immediate sale, hence the low price; only $4000, easy terms; for details and traveling instructions for this and a 220-acre farm for only $3200 with income of $3050 last year, see page 67, our "New Mammoth 75-Page Farm Catalogue No. 36"; beautifully illustrated and filled with a wonderful assortment of money-making farms; send today for your free copy, it will save you lots of time and money. Box D, Sussex, N. B.

Each age of our lives has its joys. Old people should be happy, and they will be if Chamberlain's Tablets are taken to strengthen the digestion and keep the bowels regular. These tablets are mild and gentle in their action and especially suitable for people of middle age and older. For sale by all dealers.

Dr. de Van's Female Pills

A reliable French regulator; never fails. These pills are exceedingly powerful in regulating the generative portion of the female system. Refuse all cheap imitations. Dr. de Van's are sold at $5 a box, or three for $10. Mailed to any address. The Scobell Drug Co., St. Catharines, Ont.

"Monarch" Engines Save Running Cost

"Monarch" Engines give more power than their rating, yet use no more fuel. This is due to good material and design. The fuel tank is one solid piece, preventing leakage. Every drop of "Monarch" fuel gives a return in power, and full power at that. It pays to get a "Monarch." The "Monarch" pays for itself by saving fuel.

THE HORSE.

Parasitic Mange in Horses.

Parasitic mange is the name given to a condition of the skin caused by parasites, which are known as mites or acari. They belong to the family Acaridae. Mange assumes the character of a contagious disease, since the parasites may be conveyed to other equine animals. The mange mites are exceedingly small, round or oval in shape, and usually only visible when magnified by the use of a hand lens or microscope.

FORMS OF MANGE.

Three varieties of parasitic mange affect horses, asses, and muffes, viz.: (1) Sarcoptic, (2) psoroptic ,(3) symbiotic. Each is caused by a special mite which has a somewhat different mode of life.

The Sarcoptic form spreads slowly, but is the most serious on account of its being the most difficult to cure. The mites, known as the Sarcoptes, bore their way through the outer skin, burrow underneath it, and cause irritation to the animal, setting up inflammation of the skin. In the small galleries or tunnels thus formed the mites lay their eggs. It is on accodnt of this burrowing habit that it is difficult to reach the parasites with destructive agents. The mites may attack any part of the body, but they usually settle first about those parts which come in contact with the saddle or other harness, from which they may spread to other parts. The psoroptic form of mange is analogous to the itch or scabies of man. The Psoroptic form generally spreads more rapidly over the body. It is more prevalent than the Sarcoptic form. At first it is usually confined to those parts situated near the long hair of the body, such as the neck, withers, rump, and base of tail, but in advanced or neglected cases the parasites may spread all over the body, and be found on the buttocks and inside the thighs. The mites, which are known as Psoroptes, live on the outer surface of the skin, and cling to it by means of their mouths and limbs. They bite the skin to obtain food, causing irritation and inflammation. Over the injured parts scabs are formed and scurf accumulates, amongst which the mites shelter, feed, and breed. The scab increases in size as the mites increase in number, and each new generation of young parasites selects fresh feeding ground, usually around the edge of the older scab, or the mites may, through the grooming, be disturbed and distributed, setting up additional centres of disease on other parts of the skin. The Symbiotic form is probably the most prevalent, but it is not so serious as the two former. This form is usually confined to the extremities of the legs, but may also affect the tail. It develops slowly, and only exceptionally invades other parts af the body. An animal may harbour more than one form of mange at the same time.

SYMPTOMS.

Mange may not always be detected until it has made considerable progress, or the early symptoms may not have been regarded with importance by the owner or the attendants. The first indications are that the animal is restless, appears to be itchy, is incessantly rubbing against any objects within reach, including the pole or shafts of the cart, or against other horses, as is frequently seen at grass. Affected animals will even bite and gnaw the parts attacked by the parasites, scratch the parts with the hind limbs if accessible, and stand rubbing one leg against the other. They may be seen or heard scraping, pawing, kicking, or stamping the feet a good deal, especially during the night in a warm stable. There may also be switching and rubbing of the tail. When the scabby parts are touched with the hand or passed over the grooming tools, the animal will lean towards the attendant and manifest a sense of pleasure, which is frequently accompanied by a nibbling movement of the lips. The hair over the affected parts bristles or stands erect, and in more advanced cases is twisted or broken off short. Bare patches of skin are seen, due to the hair falling out or having been pulled or rubbed out. The skin may show an inflamed, pimply surface, with some long or broken hairs still in place, or the part may be quite bare and scurfy. The parasites cause pimples to appear on the skin wherever they bite. Yellowish lymph exudes from the pimples, and helps to form small scabs. This lymph may mat the scabs and hairs together into a hard mass, which may be partly or entirely rubbed off, leaving an excoriated surface. On the hairless parts red, scabby spots may be seen, which readily bleed, and there may be patches of scab containing blood adhering to the skin. In advanced, neglected, and bad cases the skin loses its elasticity, becomes dry and hard, and is wrinkled or corrugated into folds. Finally the scabby skin may crack, forming deep fissues. These may bleed and leave nasty, unhealthy-looking sores, which in turn may fester or suppurate. There is also an offensively smelling discharge in many cases. If

Horsemen Attention!

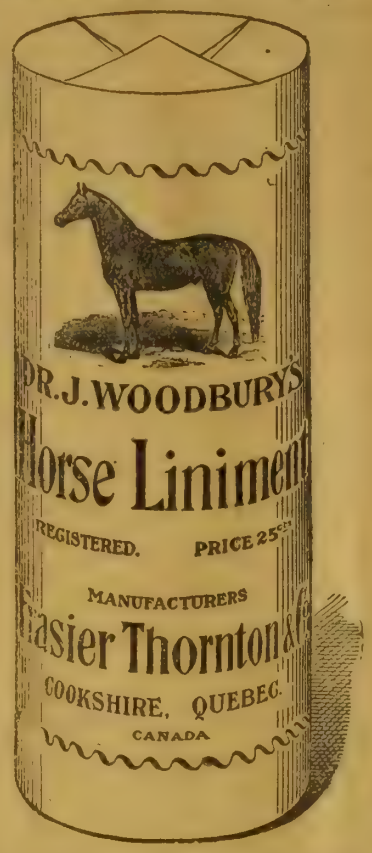
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Thier use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pinkeye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Troubl, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsemen of the Dominion endorse Dr. J. Woodbury's Horse Liniment

For Sale all Dealers

Price 25 cents



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

Removes Bursal Enlargements, Thickened, Swollen Tissues, Curbs, Filled Tendons, Soreness from any Bruise or Strain; Stops Spavin Lameness. Allays pain. Does not Blister, remove the hair or lay up the horse. $2.00 a bottle, delivered. Book 1 K free.

ABSORBINE, JR., the antiseptic liniment for mankind. For Synovitis, Strains, Gouty or Rheumatic deposits, Swollen, Painful Varicose Veins. Will tell you more if you write, $1 and $2 per bottle at dealers or delivered. Manufactured only by W. F. YOUNG, P.D.F. 124 Lymans Bldg., Montreal, Can.

It is now well known that not more than one case of rheumatism in ten requires any internal treatment whatever. All that is needed is a free application of Chamberlain's Liniment and massaging the parts at each application. Try it and see how quickly it will relieve the pain and soreness. Sold by all dealers.

the disease is allowed to proceed unchecked the animal speedily loses condition, and becomes emaciated. The animal gets no rest from the incessant irritation, the appetite fails, the animal has a very dejected and repulsive appearance, becomes weaker and weaker, and may even die in a state of exhaustion.

In the Symbiotic form of mange a horse may do serious injury to its limbs, particularly to the coronet, by bruising it with the opposite foot in making attempts to relieve the itchiness.

TREATMENT.

Mange is not primarily a disease, but a condition of the skin resulting from the presence and action of the parasites or mites, which obtain their nourishment by piercing the skin. The treatment must be directed to the destruction of the parasites and their eggs, and it is possible to use effective local remedies in the form of skin dressings, which will not only destroy the mites without causing further injury to the inflamed and irritated areas, but will act beneficially by allaying the irritation. The treatment is essentially an external one, but plenty of good food should be given, and if the animal's condition has been reduced or the health materially impaired, tonic medicine given internally may be indicated. Usually, however, recovery is affected without internal treatment.

PREVENTION.

All newly-purchased animals should be carefully examined for suspicious areas on the skin, and if such are present the animals should be isolated and kept under observation until expert advice can be obtained, but those in charge must not forget that mange caused by Saroptes or Psoroptes in equine animals is a notifiable disease. Care should be taken not to use second-hand or borrowed harness, clothing, grooming and stable utensils which have not been thoroughly cleansed and disinfected. Owners should be particular about the livery stable which their horses frequent, and litter which has been used for other animals should be regarded with suspicion.

In addition to the isolation and treatment of an animal actually affected with mange, particular attention must be paid to cleansing and disinfecting the stable, litter, harness, and all articles that have been used about the patient. The premises and articles to be included in the disinfection must be reckoned from a time prior to the recognition of the disease.

Depraved Appetite.

W. A. R., has a driving horse that has for some time been troubled with pimples on shoulders and sides, and has also eaten his dung when he could get at it. All symptoms are worse when not on grass, and when off grass he steadily grows poor on good feed. Symptoms are usually attributed to a lack of mineral matter in feed. Keep before this animal at all times a mixture of salt, 2 parts, sulphur 1 part, wood ashes 1 part, and powdered charcoal 2 parts. Begin by giving on an empty stomach at one dose, 1½ quarts raw linseed oil and 2 ounces of turpentine well mixed, followed in three days with powder given below in feed twice a day. Powdered sulphate of iron 2 ounces, powdered nux vomica 1 ounce, sulphate of soda 4 ounces, and powdered licorice root 4 ounces. Feed liberally with coarse bran, and give the molasses if you choose. It works very well with some horses. Dose, a tablespoonful morning and night.

Scratches.

Scratches, also called cracked heels, or mud-fever, can be prevented by careful stable management. Cases are rarely met with in well kept barns, but are often seen in dirty, poorly-drained stables. Dryness and cleanliness of the floor of the stall are the two most important factors in the prevention of scratches.

Horses should not be allowed to stand in piles of manure and decomposing urine. These irritate and inflame the thin skin in the fold of the ankle, just below the fet-lock. The skin then becomes thickened, due to the inflammation, and breaks or cracks in it appear and if allowed to go untreated, the condition grows gradually worse. The affected area grows larger, the cracks become deeper, and the animal is in an unsightly and painful condition.

Owners of horses can prevent the trouble in the majority of cases, by doing two things. Do not allow manure to accumulate behind your horses, and see that your stalls are so constructed that the urine will drain away promptly. If your horses show any tendency toward the condition, apply a small amount of carbolized vaseline, benzoinated lard, or zinc oxide ointment, well rubbed into th affected parts. These remedies will soften the skin and protect it from external moisture and irritating substances. During wet weather, or when the roads and streets are muddy or slushy, extra precautions should be taken to prevent the condition. Do not wash cracked heels, as water and rubbing only aggravate the condition. —Dr. H. Preston Hoskins, University Farm, St. Paul.

POULTRY.

Eggs to be Bought and Sold on Quality Basis After June 1st.

After June 1st next eggs will be bought and sold in Canada on their merits of freshness, cleanliness and quality. Such was the resolution adopted by the Canadian Farm Produce Association at their recent meeting in Toronto.

For a long period the wholesale egg dealers in this country have been dissatisfied with the case count basis, upon which eggs are bought and sold. The chief fault is that it put a premium on bad eggs; just as much is paid for bad eggs as good ones. For years anything and everything covered with a shell went as salable eggs, whether one hour, one month or one year old. This is manifestly unfair to shipper of even reasonably fresh eggs, he getting no benefit, being placed on the same price level as the careless, indifferent producer. The aim is to put the egg trade on a better basis. All who handle eggs, the producer, merchant and consumer have to pay their share for the bad eggs that are marketed. The purpose is to remedy this.

Eggs will be candled by receivers and paid for according to grade. Rots will not be paid for, but a higher price will be given for good eggs.

Legislation has been proposed, to penalize for the sale of impure (stale and rotten) eggs. Education does not seem to remedy this evil and legislations must be had to give more force to the teaching.

The poultry Superintendent will be pleased to render any assistance to dealers in the way of instruction in testing eggs. With the present facilities of egg testing it is an easy matter to detect any impure egg, and thus prevent the loss of receiving bad eggs and have them turned down by the dealers, after expressing them long distances.—Seth Jones, Poultry Superintendent.

The Brahma as a Utility Fowl.

Uncle Isaac Felch, in recent writings, is again extolling the merits of the Light Brahma fowl as a utility bird. Mr. Felch in his contention is correct. He has shown that this variety cannot only be made excellent winter egg producers, but that for broilers or roasters they have no superior.

The writer has bred Brahmas for years—probably as long as has Mr. Felch. Tae first love was the Dark variety, but since the introduction of the Light Brahma that former variety seems to be placed in the background.

Between the two varieties, however—the Light and the Dark—the former far excel. In point of plumage they about equally divide honors. But it is to the Light variety that we wish to particularly refer.

As winter layers, Light Brahmas, if properly feh and cared for, will give more eggs than any other breed the writer has ever tried; not only do they show their ability in numbers, but the size of the egg exceeds that of any of the American or Asiatic classes, and, besides, the color—a rich brown—is of the best, and just such a shade that would fill the breeders of the American class with joy.

It does not end with their laying. They will make quick broilers—in ten weeks from the time they are born they are plump chickens. We can never forget a lot of young stock we some years ago saw on a farm in Massachusetts. They were but sixty-one days old, and the weights were, cockerels,—we weighed only eleven—three pounds and one ounce for heaviest, and two pounds and four ounces for lightest. The pullets weighed two pounds and eight ounces for heaviest, and two pounds for lightest. These were live weights.

Mr. Felch himself accompanied us to that farm so that he might prove his contention that Light Brahma chicks at eight weeks of age make good, plump broilers.

But there is a market objection to the Brahma as a broiler. It comes not in quantity nor quality of flesh, neither is it in the time of maturity, but simply in the fact that the American fad does not want feathers on the legs. And why not? We do not eat the legs, but the peculiarity of our market buyers say it spoils the appearance. We must cater to the whims of the market.

However, there is a place for them where there can be no objection, and that is in the roaster class. In this way they are ideal. Large enough and fit enough for a king. There is both quality and quantity of meat. At six months of age they are in prime condition, weighing easily a pound for each month's age—six pounds for six months—and if they are kept over for a full year, all that time properly fed and cared for, they will give twelve full pounds for that year's lease of life.

Truthfully it has been said the Light Brahma is the king of the roasting fowls, but we wish to add

High Quality Builds Big Telephone Business

THIS business was organized to manufacture telephone equipment for independent local and municipal systems. Right from the start our equipment made records for efficiency. It did not take long for our goods to acquire a reputation for quality and reliability. As a result, our business has grown by leaps and bounds.

It Is a well known fact that we have been securing over 80 per cent. of the new telephone business in Ontario. The business, too, has been secured with less effort than business secured by competitors. The satisfaction our telephones and equipment have given under all conditions has paved the way for easy business getting.

To judge how fast our business is growing, you'll remember we stated in a previous announcement that our business last year doubled that of the year before. Well, this year the first two months' sales total more than twice the 1912 sales for the same period. More and more is it being recognized by those in the local telephone business who are interested in depreciating the success of the independent telephone movement and the development of municipal systems. On the other hand, our business lies wholly and directly with the independent telephone systems, and it is to our own best interests to look after these systems well, as on their success depends the growth of our business.

If you would like a list of the large independent telephone systems built in Ontario during the last twelve months, just drop us a line. We would be glad to send you a list of the systems, with the make of the telephones they are using. In fact, if you'll name over the large independent systems built during the last year in Western, Northern and Eastern Ontario you'll find that nine out of every ten are using our telephones and equipment.

You are absolutely safe in equipping your system with our telephones. We guarantee them as regards material and workmanship. In fact, we guarantee all Our equipment and materials. And in addition we offer to send our telephones for ***Free Trial,*** so you can test and compare them with others right on your own lines before risking a dollar.

Ask for our No. 3 Bulletin—containing the latest information about building telephone lines—Also No. 4, describing our magneto telephones, is free on request.

an amendment—it is the Peer of the Utility Class.

It is not only hard to sell a lean chicken in market, but it also is poor eating. A little care and feed will make them more inviting.

It is claimed that a single comb fowl fattens best. An English authority says that he has found that a single comb fowl always grows fatter and plumper than any others.

It is a waste of food to keep young cockerels after they weigh five pounds to the pair, as they are sold as "old roosters" after their combs grow. While the market rate for old roosters is from five to nine cents a pound, young ones often sell at from 15 to 20 cents per pound. It is a loss to keep them longer than when they are old enough to sell.

One part of cedar oil and two parts of vaseline is an excellent treatment for sore head.

When the hens become too fat the result is apt to be egg bound, soft and irregular shaped eggs, dizziness, applexy, liver complaint and kindred diseases.

It is claimed that nux vomica is a specific for liver complaint in fowls, if taken in time. The dose is given in Homeopathic form, allowing six pills three times a day to a large fowl and less to a smaller one.

The following formula for roup pills is recommended: Half a dram each of cayenne pepper, ginger, mustard; half ounce of plain vaseline or clear lard; mix thoroughly and add enough flour to make a tough dough. Make into pills the size of a pea. Dose, one night and morning.

The following is said to be the recipe for making Vale's roup pills, a popular English remedy: Hydrastin, 2 grains; sulphate of iron (dried) and sulphate of copper, 3 grains each; powdered capsicum, 12 grains; oil of copaiba, 20 drops; Venetian turpentine and calcined magnesia, of each enough to make 24 pills. Dose for adult fowls, one or two pills, night and morning.

Diseases of the liver are caused by overfeeding of fat producing food or by the use of too much spice or stimulating substances. This particular trouble, is hypertrophy of the liver, which is an enlargement of that organ, and is often found in hens kept over the second winter. It is due to feeding too much fatty food, combined with a lack of exercise. In the early stages the disease may be arrested by feeding lightly on bran mashes and green food, and to each quart of drinking water adding one-half teaspoonful of muriate of ammonia.

The trap nest is a regular detective. It tells the facts of the case, it tames the hen, it gives accurate reports, it it arrests the robber hens, it gives an honest count, and it exposes the fraudulent hens.

Some egg farmers candle all eggs each day as they are received from the nests. Their reason for so doing is to throw out all such that show blood clots—that is, every now and then a hen in straining to lay her egg is apt to rupture a minute blood vessel and this clot of blood sometimes shows itself inside the egg, and at other times we find the blood on the shell. When candling, this blood clot is easily seen if in the egg.

The Houdan is a small-bound fowl, having a thick breast, and the flesh is tender and juicy. They make fine broilers and the best roasters.

Some poulterers, in order to obtain the best prices for their broilers, hatch from October 1 to February 1, and have all the stock marketed by July 1.

The skin of the Langshan is a pure white, and not a dark or bluish white. The meat is fine grained, tender and juicy; thin skin and small bone, and while possibly not so much admired in the market as the yellow-skinned breeds, none surpasses it for tenderness and flavor when served on the table.

Capon and poularde rearing is a general industry in Normandy, Maine and LaBresse (a capon is a castrated male bird; a poularde is a female that has been operated upon.) Poulardes are peculiar to the LeFleche and LeMans breeds. It is the peasant farmer who fattens the young hens and creates the industry.

The main reliance of the poultry breeder is the certainty that he will always have a fairly profitable market for his meat and eggs. This is the bedrock of the industry.

The late Morgan Bates once said that the class of poultrymen that are supplying the market with eggs and poultry, are the bulwark of the poultry industry of the nation.

Because there are failures with poultry is no argument that the business is a failure. There are lots of people who never make a success of anything they undertake. Work out your own salvation, and nver mind what the croakers have to say.

A correspondent gives the following advice for trapping minks, skunks, weasles, etc.: Minks, weasles, skunks, etc., often visit the poultry house and in one night destroy from six to twenty fowls. The best way to capture minks is with a steel trap properly concealed and baited with a bird or fish. Minks travel several miles to get in a poultry yard or house. If there is a pond or stream near the house it is best to trap them along the place of their natural haunts. Take the fat from some fish and [illegible] out and pour it in a bottle. Leave the cork out and expose it until the oil decays and becomes very strong. A few drops of this placed upon any bait will attract a mink a long distance. Cover the trap with fine leaves or break up coarse leaves so that the jaws of the trap will not be filled up when it springs. If trapping the minks near the water it is best to set the trap under the water and make a fence with weeds so as to compel it to come out at the place where the trap is set.

Whiteduck feathers average in price in the market at from 37 to 39 cents per pound. Colored feathers bring from 17 to 23 cents per pound.

Indian Runner ducks are to the duck family, in egg production what the Mediterranean Class of fowls is to the chicken world. They are small ducks, averaging about four pounds in weight. English breeders claim that an Indian Runner duck at eight years old will lay as many eggs as a year-old duck of any other variety.

David Copperfield.

By Charles Dickens.

(Continued from last issue.)

Here Peggotty paused, and softly beat upon my hand a little while.

"The last time I saw her like her own dear self, was the night when you came home, my dear. The day you went away, she said to me, "I never shall see my pretty darling again. Something tells me so, that tells the truth, I know."

"She tried to hold up after that; and many a time, when they told her she was thoughtless and light-hearted, made believe to be so; but it was all a bygone then. She never told her husband what she had told me—she was afraid of saying it to anyone else—till one night, a little more than a week before it happened, when she said to him: 'My dear, I think I am dying.'

"It's off my mind now, Peggotty," she told me, when I laid her in her bed that night. "He will believe it more and more, poor fellow, every day for a few days to come; and then it will be past. I am very tired. If this is sleep, sit by me while I sleep: don't leave me. God bless both my children! God protect and keep my fatherless boy!"

"I never left her afterwards," said Peggotty. "She often talked to the two down stairs—for she loved them; she couldn't bear not to love any one who was about her—but when they went away from her bedside, she always turned to me, as if there was rest where Peggotty was, and never fell asleep in any other way.

"On the last night, in the evening, she kissed me, and said: "If my baby should die too, Peggotty, please let him lay in my arms, and bury us together." (It was done; for the poor lamb lived but a day beyond her.) "Let my dearest boy go with us to our resting place," she said "and tell him that his mother, when she lay here, blessed him not once, but a thousand times."

Another silence followed this, and then another gentle beating on my hand.

"It was pretty far in the night," said Peggotty, "when she asked me for some drink; and when she had taken it, gave me such a patient smile, the dear!—so beautiful!

"Daybreak had come, and the sun was rising, when she said to me, how kind and considerate Mr. Copperfield had always been to her, and how he had borne with her, and told her, when she doubted herself, that a loving heart was better and stronger than wisdom, and that he was a happy man in hers. Peggotty, my dear, she said then, "put me nearer to you," for she was very weak. "Lay your good arm underneath my neck," she said, 'and turn me to you, for your face is going far off, and I want it to be near."I put it as she asked; and oh Davy! the time had come when my first parting words to you were true—when she was glad to lay her head on her stupid, cross old Peggotty's arm—and she died like a child that had gone to sleep!"

Thus ended Peggotty's narration. From the moment of my knowing of the death of my mother, the idea of her as she had been of late vanished from me. I remembered her, from that instant, only as the young mother of my earliest impressions, who had been used to wind her bright curls round and round my finger, and to dance with me at twilight in the parlor. What Peggotty had told me now, was so far from bringing me back to the later period, that it rooted the earlier image in my mind. It may be curious, but it is true. In her death she winged her way back to her calm untroubled youth, and cancelled all the rest.

The mother who lay in the grave, was the mother of my infancy. the little creature in her arms, was myself, as I had once been, hushed forever on her bosom.

CHAPTER X

I Become Neglected, and am Provided for.

The first act of business Miss Murdstone performed when the day of solemnity was over, and light was freely admitted into the house, was to give Peggotty a month's warning. Much as Peggotty would have disliked such a service, I believe she would have retained it, for my sake, in preference to the best upon earth. She told me we must part, and told me why; and we condoled with one another, in all sincerity.

As to me or my future, not a word was said, or a step taken. Happy they would have been, I dare say, if they could have dismissed me at a month's warning too. I mustered courage once, to ask Miss Murdstone when I was going back to school; and she answered dryly, she believed I was not going back at all. I was told nothing more. I was very anxious to know what was going to be done with me, and so was Peggotty; but neither she nor I could pick up any information on the subject.

There was one change in my condition, which, while it relieved me of a great deal of present uneasiness, might have made me, if I had been capable of considering it closely, yet more uncomfortable about the future. It was this. The constraint that had been put upon me was quite abandoned. I was so far from being required in the parlor that on several occasionssions, when I took my seat there Miss Murdstone frowned to me to go away. I was so far from being warned off from Peggotty's society, that, provided I was not in Mr. Murdstone's, I was never sought out or inquired for. At first I was in daily dread of his taking my education in hand again, or of Miss Murdstone's devoting herself to it; but I soon began to think that such fears were groundless, and that all I had to anticipate was neglect.

I do not conceive that this discovery gave me much pain then. I was still giddy with the shock of my mother's death, and in a kind of a stunned state as to all tributary things. I can recollect, indeed, to have speculated at odd times, on the possibility of my not being taught any more, or cared for any more; and and growing up to be a shabby, moody man, lounging an idle life away, about the village; as well as on the feasibility of getting rid of this picture by going away somewhere, like the hero in a story, to seek my fortune: but these were transient visions, day dreams I sat looking at sometimes, as if they were faintly painted or written on the wall of my room, and which, as they melted away, left the wall blank again.

"Peggotty," I said in a thoughtful whisper, one evening, when I was warming my hands at the kitchen fire, "Mr. Murdstone likes me less than he used to. He never liked me much, Peggotty; but he would rather not even see me now, if he can help it."

"Perhaps it's his sorrow," said Peggotty, stroking my hair.

"I am sure, Peggotty, I am sorry too. If I believed it was his sorrow, I should not think of it at all. But it's not that; oh, no, it's not that."

";How do you know it's not that?" said Peggotty, after a silence.

"Oh his sorrow is another and quite a different thing. He is sorry at this moment, sitting by the fireside with Miss Murdstone; but if I was to go in, Peggotty, he would be something besides."

"What would he be?" said Peggotty.

"Angry," I answered, with an involuntary imitation of his dark frown. "If he was only sorry, he wouldn't look at me as he does. I am only sorry, and it makes me feel kinder."

Peggotty said nothing for a little while; and I warmed my hands as silent as she.

"Davy," she said at length.

"Yes, Peggotty?"

"I have tried my dear, all ways I could think of—all the ways there are, and all the ways there ain't in short—to get a suitable service here, in Blunderstone; but there's no such a thing, my love."

"And what do you mean to do, Peggotty," says I, wistfully. "Do you mean to go and seek your fortune?"

"I expect I shall be forced to go to Yarmouth," replied Peggotty, "and live there."

"You might have gone farther off," I said, brightening a little, "and been as bad as lost. I shall see you sometimes, my dear old Peggotty, there. You won't be quite at the other end of the world, will you?"

"Contrary ways, please God!" cried Peggotty, with great animation. "As long as you are here, my pet, I shall come over every week of my life to see you. One day every week of my life!"

I felt a great weight taken off my mind by this promise; but even this was not all, for Peggotty went on to say:

"I'm a going, Davy, you see, to my brother's, first, for another fortnight's visit—just till I have had time to look about me, and get to be something like myself again. Now, I have been thinking, that perhaps, as they don't want you here at present, you might be let to go along with me."

If anything, short of being in a different relation to every one about me, Peggotty excepted, could have given me a sense of pleasure at that time, it would have been this project of all others. The idea of being again surrounded by those honest faces, shining welcome on me; of renewing the peacefulness of the sweet Sunday morning, when the bells were ringing, the stones dropping in the water, and the shadowy ships breaking through the mist; or roaming up and down with little Emily, telling her my troubles, and finding charms against them in the shells and pebbles on the beach; made a calm in my heart. It was ruffled next moment, to be sure, by a doubt of Miss Murdstone giving her consent; but even that was set at rest soon, for she came out to take an evening grope in the store-closet while we were yet in conversation, and Peggotty, with a boldness that amazed me, broached the topic on the spot.

"The boy will be idle there," said Miss Murdstone, looking into a pickle jar, "and idleness is the root of all evil. But to be sure, he would be idle here—or anywhere, in my opinion."

Peggotty had an angry answer ready, I could see; but she swallowed it for my sake, and remained silent.

"Humph!" said Miss Murdstone, still keeping her eye on the pickles; ";it is of more importance than anything else—it is of paramount importance—that my brother should not be disturbed or made uncomfortable. I suppose I had better say yes."

I thanked her, without making any demonstration of joy, lest it should induce her to withdraw her assent. Nor could I help thinking this a prudent course, when she looked at me out of the pirkle-jar, with as great an access of sourness as if her black

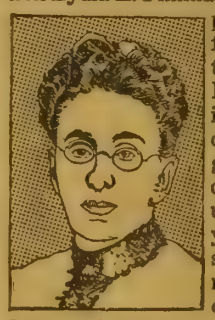
Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

SUFFERED EVERYTHING

For Years, Restored To Health by Lydia E. Pinkham's Vegetable Compound.

Canadian women are continually writing us such letters as the two following, which are heartfelt expressions of gratitude for restored health:



Glanford Station, Ont.—"I have taken Lydia E. Pinkham's Vegetable Compound and never found any medicine to compare with it. I had ulcers and falling of womb and doctors did me no good. I suffered dreadfully for years until I began taking your medicine. I also recommend it for nervousness and indigestion." — Mrs. HENRY CLARK, Glanford Station. Ont.

Chesterville, Ont. — "I heard your medicines highly praised, and a year ago I began taking them for falling of womb and ovarian trouble.

"My left side pained me all the time and just before my periods which were irregular and painful it would be worse. To sit down caused me pain and suffering and I would be so nervous sometimes that I could not bear to see any one or hear any one speak. Little specks would float before my eyes and I was always constipated.

"I cannot say too much for Lydia E. Pinkham's Vegetable Compound and Liver Pills, for there are no medicines like them. I have taken them and I recommend them to all women. You may publish this testimonial." — Mrs. STEPHEN J. MARTIN, Chesterville, Ontario, Canada.

"FOR THE MAN WHO WORKS"

Hard work is no excuse for an untidy appearance. A Challenge Waterproof Collar with its dull linen-like finish will keep you neat and well-dressed. Sold at all Gents' Furnishing and Dry Goods Shops, or send 25c. for sample collar.

Electric Restorer for Men

Phosphonol restores every nerve in the body to its proper tension; restores vim and vitality. Premature decay and all sexual weakness averted at once. **Phosphonol** will make you a new man. Price $3 a box, or two for $5. Mailed to any address. **The Scobell Drug Co., St. Catharines, Ont.**

eyes had absorbed its contents. However, the permission was given, and was never retracted; for when the month was out, Peggotty and I were ready to depart.

Mr. Barkis came into the house for Peggotty's boxes. I had never known him to pass the garden-gate before, but on this occasion he came into the house. And he gave me a look as he shouldered the largest box and went out, which I thought had meaning in it, if meaning could ever be said to find its way into Mr. Barkis's visage.

Peggotty was naturally in low spirits at leaving what had been her home so many years, and where the two strong attachments of her life—for my mother and myself—had been formed. She had been walking in the church yard, too, very early; and she got into the cart, and sat in it with her handkerchief at her eyes.

So long as she remained in this condition, Mr. Barkis gave no sign of life whatever. He sat in his usual place and attitude, like a great stuffed figure. But when she began to look about her, and to speak to me, he nodded his head and grinned several times. I have not the least notion at whom or what he meant by it.

"It's a beautiful day, Mr. Barkis!" I said, as an act of politeness.

"It ain't bad," said Mr. Barkis, who generally qualified his speech, and rarely committed himself.

"Peggotty is quite comfortable now Mr. Barkis," I remarked, for his satisfaction.

"Is she, though?" said Mr. Barkis.

After reflecting about it, with a sagacious air, Mr. Barkis eyed her, and said:

"Are you pretty comfortable?"

Peggotty laughed and answered in the affirmative.

"But really and truly you know. Are you?" growled Mr. Barkis, sliding nearer to her on the seat, and nudging her with his elbow. "Are you? Really and truly, pretty comfortable? Are you? Eh?" At each of these inquiries Mr. Barkis shuffled nearer to her, and gave her another nudge; so that at last we were all crowded together in the left hand corner of the cart, and I was so squeezed that I could hardly bear it.

Peggotty calling his attention to my sufferings, Mr. Barkis gave me a little more room at once, and got away by degrees. But I could not help observing that he seemed to think he had hit upon a wonderful expedient for expressing himself in a neat, agreeable, and pointed manner, without the inconvenience of inventing conversation. He manifestly chuckled over it for some time. By-and-by he turned to Peggotty again, and repeating "Are you pretty comfortable, though?" bore down upon us as before, until the breath was nearly wedged out of my body. By-the-by he made another descent upon us with the same inquiry, and the same result. At length, I got up whenever I saw him coming, and standing on the footboard, pretended to look at the prospect; after which I did very well.

He was so polite as to stop at a public-house, expressly on our account and entertain us with broiled mutton and beef. Even when Peggotty was in the act of drinking, he was seized with one of those approaches, and almost choked her. But as we drew near to the end of our journey, he had more to do and less time for gallantry; and when we got on Yarmouth pavement, we were all to much shaken and jolted, I apprehend, to have any leisure for anything else.

Mr. Peggotty and Ham waited for us at the old place. They received me and Peggotty in an affectionate manner, and shook hands with Mr. Barkis, who, with his hat on the very back of his head and a shame-faced leer upon his countenance, and pervading his very legs, presented but a vacant appearance, I thought. They each took one of Peggotty's trunks, and we were going away, when Mr. Barkis solemnly made a sign to me with his forefinger to come under an archway.

"I say," growled Mr. Barkis, "it was all right."

I looked up into his face, and answered, with an attempt to be very profound: "Oh!"

"It didn't come to an end there," said Mr. Barkis, nodding confidentially. "It was all right."

Again I answered, "Oh!"

"You know who was willin'," said my friend. "It was Barkis, and Barkis only."

I nodded assent.

"It's all right," said Mr. Barkis, shaking hands; "I'm a friend of your'n. You made it all right, first It's all right."

In his attempts to be particularly lucid, Mr. Barkis was so extremely mysterious that I might have stood looking in his face for an hour, and most assuredly should have got as much information out of it as out of the face of a clock that had stopped, but for Peggotty's calling me away. As we were going along, she asked me what he had said; and I told her he had said it was all right.

"Like his impudence," said Peggotty, "but I don't mind that! Davy dear, what should you think if I was to think of being married?"

"Why—I suppose you would like me as much then, Peggotty, as you do now?" I returned, after a little consideration.

Greatly to the astonishment of the passengers in the street, as well as of her relations going on before, the good soul was obliged to stop and embrace me on the spot, with many

You May Have Some Trouble Reading This!

But if it serves to call your attention to the trouble you can save in your own kitchen, where Someone is trying to do good work with a poor stove, it is worth it.

And it will be doubly worth it if you decide to Act, and avoid *future* troubles for that Someone (whether yourself, your wife, the cook or all hands) by installing an—

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know women's sufferings.
I have found the cure.

I will mail, free of all charge, my home treatment with full instructions for all forms of women's ailments. I want to tell all women about this cure — you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men cannot understand women's sufferings. What we women know from experience, we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhoea, Whitish discharges, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head; back and bowels, **bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar** to our sex.

I want to send you a **complete 10 days' treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to test the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address,** tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost,** my book—**"WOMAN'S OWN MEDICAL ADVISER"** with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all woman's diseases and makes women well, strong, plump and robust. **Just send me your address,** and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. protestations of her unalterable love.

"Tell me what should you say, darling?" she asked again, when this was over, and we were walking on.

"If you were thinking of being married—to Mr. Barkis, Peggotty?"

"Yes," said Peggotty.

"I should think it would be a very good thing. For then you know, Peggotty, you would always have the horse and cart to bring you over to see me, and could come for nothing, and be sure of coming."

"The sense of the dear!" cried Peggotty. "What I have been thinking of, this month back! Yes, my precious; and I think I should be more independent altogether, you see; let alone my working with a better heart in my own house, than I could in anybody else's now. I don't know what I might be fit for now, as a servant to a stranger. And I shall always be near my pretty's resting-place," said Peggotty musing, "and be able to see it when I like; and when I lie down to rest, I may be laid not far off from my darling girl!"

We neither of us said anything for a little while.

(To be continued)

Home-Made Toilet Powders.

A woman can save considerable by making her toilet powders at home, and when she prepares them herself she knows they are safe to use. A good and safe powder for the face is made with the common prepared chalk. Get the best quality of chalk, put it in a china bowl and break the pieces into small bits; then cover with cold rainwater, stir it up well and let stand over night. Then pour all of that water off and pour more water on and stir it up again; let stand all day or night and repeat this four or five times. When the last water is poured off, place the dish in the sun until the chalk is thoroughly dried out. Keep the dish covered to keep out all dust, and when perfectly dry a little perfume and a little pink powder can be added if desired. The best covering for the dish is a piece of white cheesecloth.

Another good powder is made by mixing well together half a pound of pure rice powder, twelve drops of oil of rose and six grains of carmine. Mix and sift several times through a fine hair sieve. A cake of sulphur soap is excellent in itself for pimples and blackheads, but used by the same person with a powder containing mercury would ruin the complexion. Great care should be given to the selection of powders or pastes used for cleansing the teeth. There are several good powders that can be made at home and with very little trouble or expense. An excellent powder is made with one part each of pulverized castile soap and boric powder and two parts precipitated chalk. This must be well mixed and sifted three or four times. For a greasy or shiny skin add boric powder to the prepared chalk. There is nothing better to use as a powder for perspiration than one part af the chalk and two parts of the boric powder. For young children use equal parts of pulverized starch and the boric powder well mixed, and if this is used every day it will prevent chapping and soreness of the skin.

A little of the dry boric powder sprinkled on the inside on the soles of the shoes every morning will absorb the moisture and make the shoes feel much easier on the feet. When the feet are irritated and hurt it causes numerous worried lines in the face, and this makes wrinkles.

The Selection of Wall Paper.

Although the selection of wall paper is largely a matter of personal

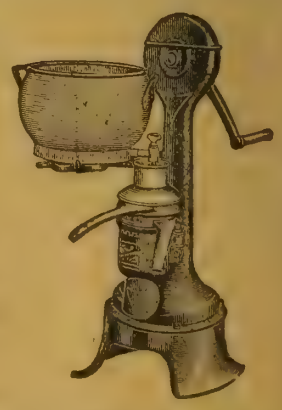
Cut Your Work in Two

By starting in to use a large capacity

Waterloo Boy Cream Separator



The favorite everywhere it goes. Note the heavy compact construction, with low down handy supply can.

The 900 lb. size Waterloo when at speed and skimming takes no more power than the ordinary 500 lb. size separator of other makes.

The large capacity Waterloo hand separator will save you time, labor and expense, because it will cut the labor of skimming the milk more than in two, not only because it turns easier than most other hand separators, regardless of capacity, but because it does the work in half the time.

In these busy days, when labor is so scarce and so expensive and so unsatisfactory, a saving in time is a great direct saving in money to you.

Please write us a post card to-day asking for Free book describing this cream separator.

The Sussex Motor Co., Ltd.,
SUSSEX, N. B.

We have for sale a few second hand machines of other makes that we have taken in exchange for our Waterloo Boy. Come in and see them.

WAS SO NERVOUS
COULD NOT EAT OR SLEEP.

There are many people who become worn, weak and miserable because their nerves become so unstrung they cannot sleep, and wherever there are ones troubled in this way they will find that Milburn's Heart and Nerve Pills will restore the deranged nerves to full life and activity.

They do this by their invigorating effect on the nerve centes, and will tone up the whole system to a perfect condition.

Mr. George McBeath, Round Hill, N.B., writes:—"I take the pleasure of writing to tell you the great benefit Milburn's Heart and Nerve Pills did for me. I was so nervous I could not eat or sleep, and could not even do my work, and I failed to a shadow. Finally I consented to try Milburn's Heart and Nerve Pills, and have only taken two boxes, and am able to work as well as ever, and can eat and sleep as well as ever I did. I can't praise your medicine too highly. My wife is taking them now for palpitation of the heart and is improving greatly."

The price of Milburn's Heart and Nerve Pills is 50 cents per box, 3 boxes for $1.25.

For sale at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Quality Butter

That's the kind you make with Maxwell's "Favorite" Churn.—

Maxwell's "Favorite" is used all over the world—in Denmark, the butter country of the world—in the United States, in spite of high tariffe—and in every Section of Canada. Our Agricultural Colleges and Govt. Inspectors recommend it, because it is the finest butter-maker in the world.

Write for catalogue if your dealer does not handle it.

THE ORIGINAL AND ONLY GENUINE

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited

taste, there are a few rules or truths that must be taken into consideration. The whole family should have something to say about the selection of wall paper and a final vote taken of three or four patterns sifted down from a possible fifteen. There are several little things which should govern the selection of colors and patterns. Deep and ornate borders should never be used in low rooms. Highly figured patterns are also bad for these rooms or, in fact, anywhere, for they are very fatiguing and confusing, and the eye soon tires of them. Striped or plain papers have a tendency to add to the apparent height of a room. Gaudy and unusual patterns should be avoided, for they spoil the effect of the furniture.

A room occupied by an invalid should be papered in plain, restful colors, for a large-figured, confusing design will drive one almost frantic if they have to live with it all the time. A plain background is best where pictures are to be hung or where there is much bric-a-brac. Large figures and varied colors are too confusing for such rooms. Color plays a very important part in our health, happiness and comfort.

Each room should be treated in relation to the others around it so that conflicting colors will not spoil the harmony. With this idea in view, many people successfully treat an entire floor in one color. Color sometimes makes a room look larger or smaller than it really is. Red has a tendency to contract a room and make it coty and small; that is why this color is used so much in dens. Green and brown do not seem to make any difference, but blues, yellows, tans, pinks and grays seem to add space. Yellow is a delightfully sunshiny color, very good for a north room. Red is a stimulating color, but should be in awell lighted room, as it absorbs light. Blue is usually a failure in a much used room, for it has a depressing quality. Green is restful, but, like red, absorbs light. Delicately tinted papers are the most expensive, for they fade easiest. Light sunny rooms should have good, substantial colors. In the long run it pays best to get papers of a good grade, for where the hanging must be hired done it costs as much to hang the poor as the good, and the latter will last much longer.

Prevent Moth Injury.

Plenty of sunshine and fresh air are the most effective helps the housewife has in her fight against the insect pests in our homes. Clothes moths infest closets and drawers where unused garments are stored, and while the moths themselves are harmless, they should be killed whenever seen, because they lay eggs from which the caterpillars develop. These feed mostly on woolens and carpets, fur and feathers. Fortunately they are rarely seen in winter, and are short-lived, but articles that are stored away should be taken out in the sunshine and air occasionally, and carefully examined and brushed to prevent serious damage. Moth balls and various other repellants may keep moths out of an article, but have no effect on those already there. Another moth, which is often mistaken for the smaller clothes moth, infests all kinds of dried grains and fruits.—Alice McFeely, University Farm, St. Paul.

Visitor (to facetious farmer): "I'd like to know why on earth you call that white pig 'Ink'?"—Facetious Farmer: "Because he's always running from the pen!"

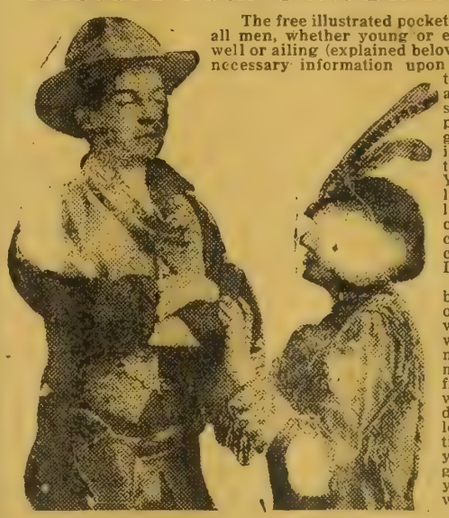
Something New for Men
Restore Your Own Strength--No Drugs



Manly Men Fascinate the Whole World

The free illustrated pocket compendium of private advice for all men, whether young or elderly, single or married, whether well or ailing (explained below), not only contains a great fund of necessary information upon certain avoided private subjects, telling you what to avoid, what to do and what not to do, but also fully describes a new small mechanical appliance called a VITALIZER which generates a natural force and which is now being worn by men all over the world who seek new manly vigor. You, yourself, no matter where you live, may easily have one of these little VITALIZERS to try out in your own case. Therefore, please use the coupon below and get this free pocket compendium by return mail. SANDEN, AUTHOR.

How would YOU, reader, like to be strong, vigorous, vital and manly once more, without an ache, pain or weakness? If you really seek and want this new vigor, this rugged manly strength, then please call at my office or write today and get my free book that you may know the whole wonderful story of this great, drugless, self-treatment, this marvellous little VITALIZER of my invention, which you wear comfortably on your body, and which sends its steady gentle, silent supply of FORCE into your nerves, blood and organism while you sleep.

Real manhood with a perfect manly strength is not only nature's own gift, but, according to my belief, may easily be within the reach of practically any man. Of course, we all know that it is the husky, vigorous, vital fellow who attracts both women and men to him, and it is he, also, who is ever sought out and who achieves the really big things of life. Sturdy, vital manhood is, without doubt, the one great, silent universal power which fascinates us all, no matter how we may argue to the contrary. Therefore, reader, I care not what may be your age, nationality or creed, whether you are married or single, whether you are a bank president or work on the farm or in the shop, nor do I care how unstrung or nervous you may feel, or what past acts may have left you debilitated and enervated, I say to you in all seriousness, if I can show you an easy, drugless way by which you may treat yourself with the object of bringing back full vigor to your organism, then I will show you the road to new hope and new manhood. A man may be small in stature, yet as strong and attractive as a giant, or he may be big in stature, yet unstrung, nervous and unmanly. It is all a question of your own vigorous strength. Therefore, let me suggest that you call or write at once, then, after reading my book, if you decide you want to try out my little vitalizer in your own case, and will write to me saying so, I will reply to your letter and guarantee to make an easy proposition which should enable you to have one of the vitalizers at once. At all events, you need the knowledge that my little book contains, whether you ever get a vitalizer or not, so please call or fill in and send the coupon.

NOTE—With special attachments my VITALIZER is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, nervousness and general ill health.

Free Self-Help Book For Men

I publish a little illustrated pocket compendium in booklet form, as mentioned above, which is meant to guide both single and married men along the road of Vigorous Health and Moral Rectitude, so they may be as vigorous and strong as the best, and may live to a ripe, healthy old age. There is a lot in this little compendium which every young or elderly man should know and can refer to from time to time with great profit to his own physical health. The booklet in one part fully describes my new VITALIZER, the great drugless self-treatment. If it is not convenient or if you are too far away to call, please write for this booklet today. It will come to you in plain, sealed envelope by return mail. Please use coupon. Office hours, 9 to 6.

Fishy Flavor in Butter.

The fishy flavor of butter has been known for a number of years, one of the first references being of its presence in Australia butter sent to England in 1900. A considerable depreciation in prices resulted and a dairy expert in New South Wales set to work to discover the cause. In his opinion the fishiness of Australia butter was due to a mould and pasteurization was advised.

Later in 1909, L. A. Rogers, of the United States Department of Agriculture, published a bulletin on fishy flavor in butter, in which he states that the trouble is widespread in occurrence, but most noticeable in newer dairy sections. It occurred at times in fresh butter made during the summer months, but usually appeared in cold storage butter after it had been held over some time in cold storage, and even low temperatures did not prevent the development of the fishy flavor.

In the opinion of this author, fishy flavor is caused by a slow, spontaneous chemical change by which acid is developed and which is favored by small amounts of oxygen. As a means of prevention be advocated making butter from pasteurized sweet cream; and butter made from pasteurized sweet cream with a starter, without ripening, seldom, if ever, becomes fishy.

OPINIONS OF DEALERS.

Several large exporters of butter in Montreal were asked if they had any experience with this defect in Canadian butter, and if so to what extent and to what degree it depreciated the value of the article. The replies may be summarized as follows:

"There have been many theories as to the cause of "Fishy Flavor" in butter. Formerly "Fish" was given as a reason, then "Salt," then "Salt that had been near fish," then "Salt stowed in vessels crossing the ocean:" but more recently the fault has been attributed to "Dirt" in various forms, the flavor being taken in through the milk or cream or through the salt. Probably the fault comes more frequently through the salt than in any other way, but we are satisfied that there are other causes."

"We have met with this flavor in butter quite frequently, and fishy flavor butter usually sells at one to two cents per pound under the price of finest, the depreciation, of course, depending upon market conditions. It has been our experience that fishy flavor is not often met with in new butter, but generally arises in butter that has been held in cold storage for some length of time. We have also noticed that when butter is very mild salted and fishy flavor does not seem to develop to the same extent as in higher salted butter,"

"Re Fishy Flavored Butter. This is a common fault with all held butter, and we think only an exaggerated term for "staleness," at least the two go hand in hand. It is a question of degrees. The lower the temperature the slower the process. We think salt sometimes turns butter fishy. "Saltless" butter is rarely fishy in low temperature. As to the value of the faulty flavored butters, it is a question of degree again. Personally, I would not have fishy butter on my table as a gift, but there are many people who seldom or never get anything else; of course, they don't know as I do. Ordinarily, such butters have to be sold at 1 to 4 cts. per lb., under finest, mild, fresh flavored. Canadian tastes have changed very much the last few years as regards butter, and it is more difficult to sell low grades than formerly, even at the reduction. There is not so much fishy butter as formerly be-

RU-BER-OID
TRADE MARK REGISTERED

The original prepared roofing, which for 22 years has withstood the severest climatic conditions, on all classes of buildings. RU-BER-OID has over 300 imitations, but no equal. It is weatherproof, fire resisting, easy to lay, and gives longer service per dollar of cost than any other roofing.

cause we think it goes into consumption more regularly now than in former years."

MAY BE DUE TO SALT.

I think it is reasonable to assume that fishy flavor may be imparted to butter by poor salt, probably of sea origin, and by certain small crustacea, but we may set these reasons aside, for under our conditions these are seldom, if ever, met with. Let us discuss, therefore, those most likely to occur under our own conditions. I think most makers who have to make butter from gathered cream will agree with me that during the hot weather the cream received at the factory is over-ripe. It has quite a high degree of acidity, and in many cases a secondary fermentation is commencing. The task of the maker to produce a first-rate article from such raw materials becomes at once a very difficult one, for the control of the acid fermentation is beyond his control, and secondary products are being formed in the butter by a variety of organisms. Even pasteurization of stale cream would not bring the best results, for many of the changes go on without the organisms, but through the agency of enzymes, elaborated by them.

MEANS OF PREVENTION

Undoubtedly Roger's remedy of making butter from pastiurized sweet cream prevents fishy flavor, but this remedy cannot be carried out under our present system of making butter from gathered cream.

We must either take precaution to obtain cream in better condition or use some method of treatment in the factory.

The most obvious method of improving the gathered cream is a campaign of education to show patrons the necessity of cleanliness in each detail connected with milking and separating, and the importance of immediate cooling and holding the cream at a cool temperature, until it arrives at the factory. These details have been given so often that I need not enlarge on these at the present time.

The proper treatment of the over-ripened cream at the factory is a more difficult question. Some recent experiments have shown that ozone may be used for deoderizing stale cream. The cream is first parteurized and then carried on to an agitator and treated with ozone for 40 minutes. The cream is slightly bleached by this process and completely deodorized and the acidity reduced one half. After cooling the cream is churned into butter. Butter made by this process grades as No. 1. Such a process would have to be carefully investigated under factory conditions, and the cost carefully computed before it could be adopted with certainty, but if makers are finding it difficult to manage gathered cream successfully, and if they cannot obtain cream sufficiently sweet for the best manufacturing result, then some process such as that described would seem advisable in order to secure the best results.—From an address by Dr. F, C. Harrison at Western Ontario, Dairymen's Convention.

Profitable use of the By-Products of the Dairy.

By the term by-products we mean buttermilk, milk and whey.

BUTTERMILK.

When allowed to stand 12 hours and the water taken off buttermilk is one of the best of foods for pigs and chickens. It is not only valuable in itself but it helps to digest other foods and so makes them valuable. It is specially good for fowls who are in a winter range as the acid in the milk supplies the lack of vegetable acid and so aids digestion. It is only by using up the by-products to feed the different animals that Dairy Farming pays. Butter-making alone does not pay. It is by making butter and cheese and using the by-products to feed the different animals that Dairy Farming is a profitable business.

Buttermilk may be utilized in two ways:

(1) As a drink for man.

(2) As a food for animals.

BUTTERMILK as a drink for man has lately been very highly recommended by medical men. It is recommended as an aid to digestion owing to the large percentage of lactic acid waich aids digestion and prevents fermentation. In summer it is used largely as a cooling drink.

Its composition varies according to the making of the butter, but if the butter is churned at the proper temperature and no loss of fat takes place the average composition is as follows:—

Water 94.44 p. c., Fat .20 p. c., Casein and albumen 3.56 p. c. Milk sugar with lactic acid 1.10 p. c. Ash .70 p. c.

Buttermilk itself is rather thin and tasteless. To make it more palatable it is prepared in the following manner: Allow it to stand twelve hours, then skim off the water. To every twelve gallons of Buttermilk add six gallons of skim milk, which has been prepared in the following manner.—Heat or pasteurize the skim milk to 165 degrees F.; cool quickly to 80 degrees F.; add 1 tea-cup of starter to every gallon of milk, then allow to stand 12 hours when it should be thick and coagulated. Then strain through a fine hair-sieve in order to get rid of any lumps and add to buttermilk.

STARTER.

Another pure lactic ferment drink that is very much recommended by physicians and which is more nutritious than buttermilk is STARTER. After the starter is made it is propagated with fresh new milk which makes it more of a nourishing drink than buttermilk.

PROCESS OF MAKING STARTER:—Take a gallon of fresh separated milk, heat to 188 degrees F. and keep at that temperature for 30 minutes. Then cool to 88 F. and add bottle of pure Lactic Ferment (which may be bought at the D Laval Dairy Co., William Street, Montreal). Stir the bottle of Lactic Ferment well into milk and keep at a temperature of 88 degrees F. for 12 hours. In 12 hours if the milk is thick and coagulated it may be propagated, if not the temperature should be kept at 88 degrees F., and if necessary kept another 12 hours until it is quite thick and coagulated.

If it takes longer than 24 hours to coagulate the powder has been useless and a fresh culture should be used, the other being thrown away. To propagate the Starter take one gallon of new milk, heat to 165 degrees F.,cool to 80 degrees F., then add 1 tea-cup of the culture Starter; stir well in and allow to stand another 12 hours when it should be thick and ready for use. Before using, the top of starter should be skimmed and thrown away and the rest always strained through a sieve.

You Can Make Better Foods For The Children With "Beaver" Flour Than You Can Buy

Next to a returning Arctic Explorer, the hungriest mortal on earth is a growing boy. He is always ravenous. "He will eat anything". But why should he?

Right now is the time when his parent should be most particular about his food—to prevent injudicious eating and to protect him against unsuitable food.

Good, home-made bread, made of "Beaver" Flour—light, flaky biscuits made of "Beaver" Flour—these are real foods for growing children. "Beaver" Flour is a blended flour. That is, it is made of exact proportions of nutritious, beautifully flavored Ontario Fall Wheat and a smaller proportion of the stronger Western Spring Wheat.

It is both a bread flour and a pastry flour—and makes the real nutty flavored home-made bread and delicious pastry such as cannot be made with any purely Western Wheat Flour.

Just try "Beaver" Flour—and see for yourself how thoroughly satisfactory and dependable it is for all kinds of baking. Your grocer sells "Beaver" Flour or can get it for you. Dealers—Write us for prices on Feed, Coarse Grains and Cereals.

Improvement of the Dairy Herd.

(Continued from page 635)

the cheese season, and have December and January dry, as they should have two months rest in the year. For my own conditions, I believe and practice dairying all the year round as I consider it the best line of farming both for the farmer who practises it, and the country at large, as in the case of butter at least, it takes nothing from the soil, and by the application of the valuable amount of manure produced, he is yearly in the position that he can hope to grow more feed and carry more stock.

The man who takes $500 from hay and grain gets the money, for his labour and the fertility that he has sold, but the produce is gone from him and he can get no further benefit from it. But the man who takes $500 for butter creates at the same time conditions on his farm that will make it easier to do so another year and be a benefit for years afterward.

Dairy cattle in the line of "live stock" as wealth producers are in a class by themselves, for they can use for the production of milk the heaviest producing crops such as corn and roots that yield by far the most feed per acre of any of our farm crops. Horses are said to be profitable at present prices, but they must be fed the lighter yielding hay and grain so we are limited to the number we can carry. Poultry while also a profitable line must be largely fed the light producing crops. Sheep are in the same class. But large numbers of dairy cattle can be fed on a very small farm, after being gradually brought under this intensive system of corn, roots and green fodder which a dairy farmer with a large quantity of manure is enabled to grow, that it does not matter so much re size of the farm as the help available to handle the crops, etc.

Did you ever consider the amount of milk feed on fifty acres of roots and corn, or the amount of milk to be produced from one acre of 1000 bushels of roots, well it is really wonderful, and explains, how Denmark and some other countries are producing so much milk. They require great labor to produce. Yes! Isn't that an advantage? Isn't it well for the country that many farms that formerly supported one family are now keeping two or three? Isn't the fact that an up-to-date dairy farmer, must spend more money on an improved plant and machinery, (than an ordinary mixed farmer) a good thing for the country he spends that money in, and if by his method of farming he gradually doubles the production, or builds another farm on top of the one he used to have, isn't that also a good thing for himself and the country in which he farms? This is why Governments all over the world are doing all in their power to induce dairying to be more intensively pursued.

Any line of farming that will give profitable employment, the year round, is the farming that this Province requires, the system that will divide the work up in the year, that will allow the farmer some freedom to grow his crop in summer and manufacture it in winter, when he can personally oversee the detail work, is when good calves can be raised, when good big records can be made.

Feed is the same from month to month, temperature in the stable the same (if you wish it so) and no flies or other pests to annoy the cows. This is when there is time to give the calves proper attention, and they will not bother you again in the rush of summer.

These are some of the reasons why I follow dairying, work that is often classed as slavish, a mistake that originated in the age when a full day's work was first done and milking extra afterwards. That is plan now followed by progressive dairymen, it pays to milk and they take the time in the regular hours of the day (whatever time it takes), and in conclusion I would urge if you are following this work keep track of what you are doing, weigh and test every ten days, increase the feed and weigh it as well as the milk, so you may learn to feed profitably. Keep strict account of the work of each cow, and aim to have every bunch of calves an improvemnt on their predecessors and success is assured.—Paper read by Walter M. Lea before the Annual Meeting of the P. E. I. Provincial Dairymen's Association.

Some trees and shrubs are loaded every season with plant lice. On those affected last year one is likely to find shrubs early, and burn the trimmings, shortly become loaded with lice. Why not, therefore, trim hedges and now small, black, shiny eggs at the ends of the twigs. These can be seen on fruit and other trees, various ornamental shrubs, and particularly on the buckthorn. As soon as the tender leaves begin to unfold on this shrub the eggs hatch, and the leaves burn as well all prunnings of fruit trees? It is very well known that plant lice increase at a tremendous rate when once started, therefore, each egg destroyed now, means the death of hundreds of lice, and the consequent lessening of the work of spraying later.—F. L. Washburn, Entomologist, University Farm, St. Paul.

"Canada's Biggest Piano Value"

THINK for a moment! The money you are going to pay for that piano is **genuine 100 cents to the dollar** money: No other kind will do. Make absolutely certain of a **100% efficient piano.** Buy a

How Concrete Work Was Made Easy For You

UNTIL a few years ago farmers considered concrete a rather mysterious material, that could be used successfully only by experts. They knew that upon the quality of the cement depended much of the success of concrete work. They had no means of testing cement, such as big contractors employ, and so could not be sure of its quality.

Yet the farmer needed concrete.

He was kept from using this best and most economical of materials by

1. Lack of knowledge of how to mix and place concrete.
2. Lack of a brand of cement upon the quality of which he could absolutely rely.

Canada Cement

has supplied both these requirements.

We employed men to make a thorough investigation of the farmer's requirements; to find out where and how he could use concrete with profit to himself; to discover all problems he might come across and to solve them. This investigation was expensive. But when it was completed we had the material for our campaign to show the farmer how and where to use concrete, and we printed a book, "What the Farmer Can do With Concrete," for free distribution. That book makes every farmer who reads it a concrete expert, as far as his needs are concerned. He finds that there is nothing mysterious about concrete—that a few simple rules supply all the knowledge required.

At the same time we met the farmers' second objection—inability to test the quality of cement—by producing cement of a quality that does not need to be tested.

The Canada Cement that you buy by the bag is the same Canada Cement that is sold by the train-load for great elevators, buildings and bridges.

This Label is your assurance of satisfactory concrete work

The Feeding of Roots.

(Continued from page 637)

ROOTS FOR LAMBS.

Every feeder knows something of the importance of roots for sheep in general, and it is difficult to get a really satisfactory substitute. At the Michigan Experiment Station sugar beets gave better results than corn silage for fattening lambs, but turnips were scarcely equal to silage.

At the Iowa Experiment Station mangels were fed against corn silage. The daily gain was slightly in favor of mangels, and the grain consumed for 100 lbs. gain was less for the lot receiving mangels, but the lower cost of corn silage made it the more economical food of the two. In Great Britain, roots are used very liberally in sheep feeding, and the quality of sheep produced in that country speaks well for the suitability of the ration.

ROOTS FOR HOGS.

The average results of feeding roots to hogs at five experiment stations show that 100 lbs. of grain was replaced by feeding 557 lbs. of roots. In tests at the Ontario Agricultural College our best showing for roots was 442 lbs. of roots equivalent to 100 pounds of grain, which may be regarded as an abnormally high value for roots.

In extensive feeding trials in Denmark, it was found that one pound of ground barley was equal to:

	% Dry matter	% Sugar
7.5 lbs. mangel beets containing	11.0	6.7
6.5 " " " "	13.6	8.9
5.0 " " " "	16.5	10.9
4.0 " " " "	21.2	14.0

The very high return from feeding roots at the Ontario Agricultural College is due probably to the fact that the hogs which were not fed roots received an exclusive meal ration, and the roots appeared to stimulate the appetite, and aid digestion which was shown in the more thrifty appearance of the root fed hogs. In the Danish trials dairy by-products were fed to all the hogs, and hence the roots did not show to as great advantage, the dairy by-products giving the desired variety in the ration of the hogs which received no roots. It has also been found that hogs fed equal weights of roots and meal produced a better quality of bacon than those fed grain alone, but every horseman knows the beneficial defects.

Sanborn of the Utah Experiment Station, investigated the influence of roots upon the carcass of the animal. In his summary of results he makes the following statements: (1) The live weight gain for cattle and sheep was greater, and for hogs less, when fed on roots. (2) The dressed weight of cattle, sheep and hogs showed in every case greater shrinkage for those fed on roots. (3) The root fed animals contained more blood and necessarily more water in the blood. (4) The root fed steers had heavier vital organs. (5) The fat was always less for the root fed animals.

To summarize the whole question it may be said that corn silage is a cheap and efficient substitute for roots in some cases, but for certain classes of stock, and especially in the case of young animals, it is difficult to find anything that will take the place of roots.—By Prof. G. E. Day, O. A. C., Guelph, Ont. in Farm and Dairy.

The Louden Reason Why

—is a story of 47 years' constant practical experience and successful achievement in manufacturing Barn Equipments. The making of **easier** and **better** farm appliances has been Mr. William Louden's life work. Right from 1867, when he patented his first hay carrier, down to his latest Cow Stanchion, patented in 1912, he has been in close touch with the Farmers' needs.

Louden goods are the essence of simplicity and durability. They represent the best value money can buy.

Mutton and Its Value as a Food.

Farmers' Bu,letin 526, "Mutton and Its Value in the Diet," which has just been ussued by the Department of Agriculture, Washington, tells of good ways of preparing old dishes and of new ways to utilize, and new dishes which can be made from mutton.

Mutton and lamb have always been regarded as particularly wholesome, and there is reason for this belief, as shown by work of the Department of Agriculture. Of the two meats lamb has been the more popular in the United States in recent years, perhaps because special attention has been given to raising it for the market and to extending its season. On the other hand, mutton is the favorite in England. The whole question is simply one of taste, and mutton in some form or other has always been a staple and favorite food, used in large quantities, and, on account of its good qualities worthy of much more extensive use.

In composition and nutritive value mutton is practically the same as beef, and the average loss in weight in preparing the two kinds of meat for the table is also practically the same, yet mutton has for some time been a cheaper meat in our markets than beef. Buying in quantity is recognized as economical where the housewife has facilities for storage. There are many cases where a side of mutton could be economically purchased for home use where a side of beef would be too large for such a purpose. This would inply an economy in the selection of the mutton.

As regards digestibility, there is no practical difference in beef and mutton, both being very thoroughly assimilated. The characteristic flavor of mutton is commonly said to have its origin in the fat. It is generally relished, and may be developed or modified by various methods of cookery to meet the tastes of the family. That mutton fat can be used in the household in many ways has been demonstrated by experiments which have been made with it.

The ways in which mutton can be prepared for the table are very numerous. Some of these are well known to the housewife, and others are less familiar. All are worthy of a trial, since the ability to make many dishes with any given foodstuff is an easy way in securing variety in the diet, which is so desirable. The housewife who wishes to economize can make many savory dishes from the inexpensive cuts of mutton, which are palatable as well as wholesome.

Judged by its composition, palatability, wholesomeness, digestibilityi relative cost, and the number of ways in which it can be prepared for the home table, mutton is an important foodstuff. which is well worth the attention of the housekeeper who wishes to provide her family with an attractive and palatable diet at a reasonable cost.

A Cause of Loss in Cattle Breeding.

Unfortunately for Canadian cattle raisers, many calves are lost each year through accident of premature birth. While no doubt many of these losses are due to injuries, a much greater number are caused by contagious abortion.

For the information of cattle raisers the Veterinary Director-General has issued a reprint of a leaflet of the British Board of Agriculture and Fisheries on this disease, which is being made the subject of very careful study and experiment in the Old Country.

This reprint, which constitutes a brief pamphlet of less than four pages, deals with the subject under the following heads: Animals Affect-

For particulars get "Ford Times"—an interesting automobile magazine. It's free from Walkerville factory. Ford Motor Company of Canada, Limited.

d, The Microbe, Virulent Material and method of Infection, Symptoms and prevention.

It is written in plain language and contains information of great value to all cattle raisers and persons who are studying the disease. It is printed for free distribution to those who apply for it, but it is not sent out to the regular mailing list of the Publications Branch of the Department of Agriculture at Ottawa.

Milking Standard for Shorthorns.

Bulls.—Admitted after having four daughters in the Record of Performance, each from a different dam.

Cows.—Admitted after fulfilling the following requirements of production, and breeding as supervised by the Live Stock Branch of the Department of Agriculture.

All cows admitted must equal or exceed both the records specified below:—

	Lbs. Milk	Lbs. Butter Fat
Two-year-old class	...4,000	140
Three-year-old class	...4,500	157.5
Four-year-old class	... 5,000	175
Mature class	... 5,500	192.5

The per cent. of butter fat shall be determined by Babcock test.

Year's Milk Record.—If the test be commenced the day the animal is two years old or previous to that day, she must produce within 365 consecutive days from that date, 4,000 pounds of milk. For each day the animal is over two years old at the beginning of her year's test, the amount of milk she will be required to produce in the year will be determined by adding 1.37 pounds for each such day to the 4,000 pounds required when in the two-year-old class. This ratio is applicable until the animal is five years old, when the required amount will have reached 5,500 pounds which will be the minimum amount of milk required of all cows five years old and over.

Years' Butter Fat Record.—If test be commenced the day the animal is two years old or previous to year will be determined by adding .048 of a pound for each such day to the 140 pounds required when in the two-year-old class. This ratio is applicable until the animals is five years old when the required amount will have reached 192.5 pounds, which will be the minimum amount of butter fat required of all cows five years old and over.

Every cow accepted for registration of performance must drop a calf within fifteen months after the commencement of the test. In the four-year-old class and the mature class no cows will be accepted for registration of performance if the beginning of her previous lactation period was more than fifteen months before the commencement of the test.

All applications for the test must be mailed to W. C. Pettit, Freeman, Ont., Secretary of the Dominion Short-horn Breeders' Association.

A. C. Corfield, 71 Dock St., St. John, N.B.

Nova Scotia Provincial Exhibition September 3rd to 11th.

Notwithstanding the fact that the Nova Scotia Provincial Exhibition has always offered, and paid out far more prize money for Stock and Agricultural exhibits than any of the lower Province Fairs, yet they are not content with this honor but are prepared to keep up with the times and at the same time assist and encourage the farmer in his work by adding to the Prize List.

In the Horse Department a new class has been added, viz:—

Light Draught or Agricultural, in which the same prizes are offered as in the Heavy Draught, and General Purpose Horses.

In the Dairy Classes, a distinct addition has been added in the classes, viz:—

Section for Dry Cows, 4 years and upwards, while in all the female sections 4th and 5th prizes are added, where there are more than six or eight exhibits respectively.

In the Sheep Department extra prize money has been added in each section, or a total of twenty dollars in each pure bred class.

In the Swine Department the same addition has been made as in the Sheep Classes, or a total of twenty-four dollars in each class.

These additions swell this year's list by nearly $1,000, and are in classes in which there has always been strong competition and consequently the Commission will be called upon to pay a larger percentage of this increase. The farms throughout the Province should take these facts into consideration and show their appreciation by patronizing the Exhibition at Halifax.

Any persons who have not received copy of Prize List may have same mailed them by writing M. McF. Hall, Secretary, Halifax, N. S.

Important Appointment at the Nova Scotia Agricultural College.

Principal Cumming has just returned from a trip to the Eastern States and Upper Canada in quest of men for the Agricultural College staff and has been most fortunate in securing as successor to Mr. Stevenson, in the position of the Professor of Agriculture and Farm Superintendent, Prof. J. M. Trueman, B. S. A., at present Professor of Dairying and Head of the Dairy Husbandry Division at Storrs Agricultural College and Experiment Station, Connecticut.

Professor Trueman is one of the strongest men in his line in America, his services having recently been sought by a number of institutions. He was born in Point De Bute, Westmorland Co., N. B., being a son of the late Howard Trueman, one of the best known agriculturists in New Brunswick. He has occupied important positions in the United States for nearly twenty years but, like many another Maritime Province man, could not but recognize the call of the East when it came to him.

Mr. Trueman graduated from the School of Agriculture, Truro, in the early nineties and from Cornell Agricultural College in 1895. From 1895-97 he was Instructor in Dairying and Assistant Agriculturist at Dakota. Fow the following seven years he managed two of the largest private owned farms in the State of Pennsylvania, after which he returned to his Alma Mater, Cornell, as Assistant Professor of Dairying. From 1905-07 he occupied a similar position in Illinois and from 1907 to the present date, he has been at the head of the Dairy Department at Connecticut Agricultural College.

Mr. Trueman comes to Nova Scotia thoroughly familiar with the prevailing local conditions. He has the advantage of nearly twenty years experience in some of the leading Agricultural Colleges and farms in the United States. Wherever he is known in that country, he is recognized as a thoroughly practical man and a true friend and good adviser to the farmer. The addition of such a strong, well-known and experienced man to the College staff at Truro will, no doubt, be greatly appreciated by the students, visitors and farmers, of the Province generally, who sees in practical Agricultural education one of the greatest means to progress in this or any other country.

Cows as Weed Seed Destroyers.

An experiment conducted in Maryland tends to show that a larger number of weed seeds will pass uninjured through a horse than through a cow. A cow and horse were each fed 2 lb. of unground grain screenings with mid dlings, bran and wheat straw each morning and night for seven days. On the evening of the seventh day they were bedded with sawdust and the dung of one night collected. The sawdust and dung were thoroughly mixed and put in boxes and set on a bench in the greenhouse. The dung was collected on May 24th. On June 21st the following weeds had germinated and grown:—Cow's dung: Lamb's quarters, 149; pigweeds, 12; bindweed, 14; oxtail, 4; timothy, 2. Horse dung: Lamb's-quarters, 1,213; foxtail, 28; pigweeds, 11; bindweed, 12; timothy, 6; clover, 3; morning glory, 2; mustard, 5.

JOHN RICHARDS,
Bideford, P. E. Island,

Breeder and Importer of

Clydesdale horses of the highest quality and breeding—the stud includes the noted show and breeding horse "Baron Kelvin." Every brood mare is a first prize winner at Scotch and Canadian shows. Driving horses generally on hand, Shetland ponies of the smallest type and best breeding. Polled Angus cattle of the most fashionable strains. Herd won first prize Toronto in 1906 and many other shows. Also small herd of Shorthorns from imported deep milking families.

Northern-Electric Telephones

"You can send the Binder parts to-day? —— That's fine? Good thing I had a Telephone— I've saved a clear day."

Northern Electric Telephones

If this Happened to *You* What would *You* do?

When your Binder breaks at harvest time and you have to drive miles for spare parts, how much does it cost YOU in time and money?

"Yes, Mr. Brown; we'll send those parts to you right away — you will have them in a couple of hours."

The Telephone Saves Time and Money in Every Emergency

When disease breaks out among your live stock — the Telephone brings the veterinary to save them.

When your barn or house gets on fire the telephone brings your neighbors to your help.

Don't you think it's time to get a Telephone?

We will show YOU how you and your neighbors can build, own and operate a self-paying Rural Telephone System.

Your share of the cost will only amount to about the value of *20 bushels of wheat* — and for that you can have a Northern Electric Telephone right in your own home.

Our FREE BOOK tells you—in plain, simple language—how you and your friends can build every bit of the line and operate the system from start to finish. It is as easy as building a fence.

The largest telephone company in Canada—The Northern Electric and Mfg. Co., Limited—will stand back of you and guide and advise you in every step of the work until success is assured.

We made 95 per cent. of the telephones used in Canada to-day and have helped thousands of farmers to build their own telephone systems.

Better write for our 100-page book, "How to Build Rural Telephone Lines." If you don't, somebody in your district will—and you might as well be the man to start the movement.

M.F. 408

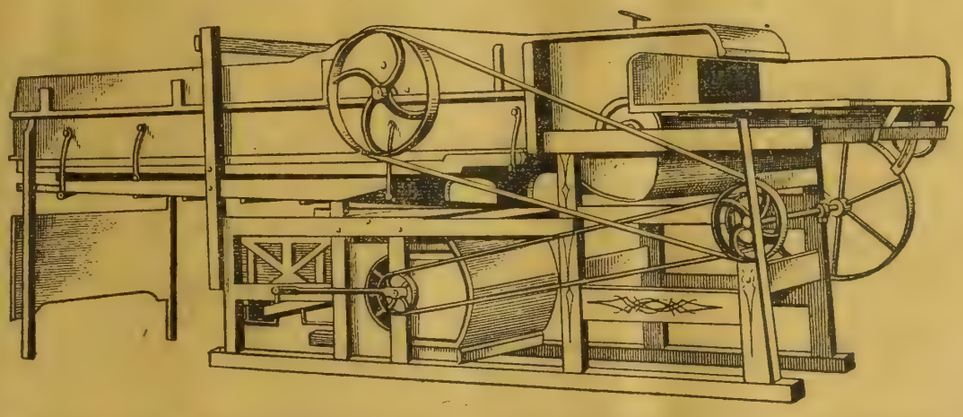
Vol. 18. SUSSEX, N. B., JUNE 24, 1913 No. 18

Little Giant Threshing Machine



¶This machine has a thirty year unbroken record for efficiency. It is made by The Hall Manufacturing Company of Summerside, P. E. I. We have sold a good many of these machines to our customers in the past few years, and it has been a pleasure to us, as everyone has been so well pleased with his purchase.

¶These machines are coming into use in Ontario and the West also, as farmers are seeing that it is an advantage to have their own machine and do their threshing, when and how they please. These machines are inexpensive, varying in price from $120.00 to $210.00 f.o.b. Point du Chene, N. B.

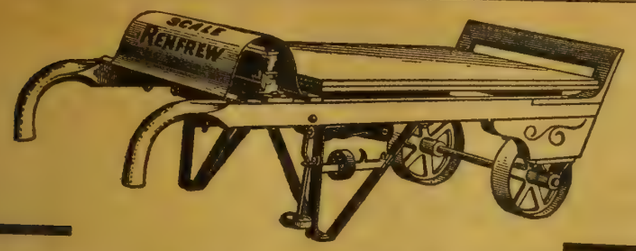
"WHEEL THE SCALE TO WHAT YOU WANT TO WEIGH"



THE "RENFREW" HANDY TWO WHEEL TRUCK SCALE

SAVES MONEY FOR FARMERS AND DAIRYMEN

Thousands of farmers are losing money yearly through the inaccuracy of their scales

It was to protect the farmers against these losses that the Renfrew Truck Scale was designed and built.

And it does protect them—by being absolutely accurate. Gives the farmer *all* his profits on everything he sells by weight.

Saves for him time and labor,—simply wheel the scale to what you want to weigh.

Weighs everything from one pound to 2000 lbs—and weighs it right.

To verify these statements:

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. S nd to-day.

We guarantee these burners to do as represented or money refunded.

The Maritime Farmer

SUSSEX, N. B.

We do not sell these burners but each subscriber may get two beside one we furnish free by sending 35 cents for each additional one wanted.

You won't be a "lucky" dairymen till you get an IDEAL GREEN FEED SILO

The "lucky" dairyman is the man who takes advantage of every opportunity to increase his milk or cream production without increasing his feeding cost, and who leaves no stone unturned to make every cow he owns produce the last cent of possible profit.

That's the kind of "lucky" cow owners you'll find with Ideal Green Feed Silos on their farms. They know that a good silo pays for itself the first year and after that it is all clear profit.

If you don't know why send for our free Silo Book which contains much valuable information about the erection of silos and the advantages of silage.

DE LAVAL DAIRY SUPPLY CO., LIMITED

LARGEST MANUFACTURERS OF DAIRY SUPPLIES IN CANADA

Exclusive Canadian distributors of the "World Standard" De Laval Cream Separators

Montreal Peterboro Winnipeg Vancouver

Ask Your Neighbor About his DE LAVAL

Wherever you find a De Laval user you will find a "booster."

The De Laval satisfies, pleases and makes money for its more than a million and a half owners.

There are probably quite a number of your neighbors who are using cream separators and in most communities a majority of these machines are De Lavals.

If you expect to buy a separator it will be worth your while to see what some of these De Laval users think of their machines.

If the evidence of your neighbors who use and recommend the De Laval is not enough to convince you of De Laval superiority, have the local De Laval agent put one in on trial for you and try any other machine you want to alongside of the De Laval.

Let the De Laval start saving your cream right now, this spring. It will soon pay for itself.

The new 72-page De Laval Dairy Hand Book, in which important dairy questions are ably discussed by the best authorities, is a book that every cow owner should have. Mailed free upon request if you mention this paper. New 1913 De Laval catalog also mailed upon request. Write to nearest office.

Knowledge of Animal Nutrition Essential in Feeding

By Prof. P. A. Campbell in Maine Farmer.

THE five general compounds which have to do with the animal nutrition are water, ash or minerals, protein, carbohydrates, and fat.

Water is found in all feed stuffs, varying in amount from a few percent in some of the grains and their by-products to about 90 percent in some of the succulent feeds like turnips. The animal body also contains a considerable amount of water, varying upon the condition of the animals as well as upon the age and species of animals. In general, more than half the weight of the animal body is water, which is continually being given off from the body in the form of vapor from the lungs; in the form of perspiration from the body, and in considerable amounts through the kidneys, and, in the case of the milking cow, large quantities are used in milk elaboration. Large amounts are necessary for the body functions, and a regular supply is necessary. It is the water held in the plant which gives to green or succulent feeds their palatibility, and through this palatability increases the secretion of the digestive juices in the alimentary tract, thus effecting a more thorough digestion, and usually creating a natural laxativeness. Consequently at seasons when animals are usually kept on dry feeds, if the ration is supplemented with some succulent feed, whether it be in a green form (just as it grows) or in a form in which it can be stored in its natural condition like the root crops, or preserved in the form of silage, the results are beneficial and the feeder gets through it a more thorough digestion of all the feed stuffs fed, and better results in the health, growth and production of his animal.

As all feed stuffs contain more or less ash or mineral matter, it is generally conceded, even by experienced feeders, that in the natural course of feeding, the animal will be supplied with sufficient ash for its requirements. But with the endeavor to produce a greater economy in feeding, and with the modern methods of milling, it is more than likely that the supply of ash sometimes becomes unbalanced, and there is need for paying more attention to it. The ash is what remains of the animal after all that burns has passed away, and in the live animal it has a direct connection with the life processes.

Jordan states that 83.9 percent of the ash content of the bone is calci- -phosphate, and to this compound is due the hardness and stability of the bone. If there is a deficiency of calcium and phosphorus in the food, it results in a mal-nutrition of the bones if continued, as is shown by a lack of development of those parts. The animal will lack size, muscular growth is interfered with, and in mild cases the growth is very largely of fat. The bone probably acts as a sort of storehouse for the mineral matter and supplies the rest of the body if the food supply becomes low, in order that the metabolic processes may be maintained. At the Wisconsin Experiment Station a cow gave off 5.5 more lime in milk and excretements than was in the food, when fed a ration low in lime. A condition like this results in brittleness and porosity of the bone, and if it were continued, would mean disaster to the animal. At the Geneva Experiment Station it has been proven that it is the mineral constituents of wheat bran which make it a laxative for ruminants at least, and the bran when freed from these salts is quite constipating.

Iron is a part of the haemoglobin of the red-corpuscles, and through its affinity for oxygen; the oxygen is carried from the lungs to the tissues, there to unite with the carbohydrate nutrients of the cells, which causes a breaking down into carbon-dioxide and water, thus the heat or energy which was used in binding them together in the leaves is liberated. This energy came, of course, from the sun, and, to quote directly from Forbes "When liberated in the animal cell", it is manifested in heat and in the various movements and processes which constitute life." Thus it is seen that iron, although of minute quantity in the animal body, is absolutely essential.

Citing a few other uses of ash in the animal body as given by Forbes of the Ohio Experiment Station, we find that calcium in the blood is essential to its coagulation, without which small wounds would result in death by bleeding. Again, mineral chlorides furnish the chlorine of the hydrochloric acid in the gastric juice; the ferment pepsin being inactive except in the presence of hydrochloric acid. There are other uses to which the ash is put in the animal body, but sufficient has been said to indicate the relative importance of the mineral elements and the necessity of giving them consideration, although as yet enough is not known about them so that the feeder can give a great deal of attention, except to get an idea of those feed stuffs which carry an abundance. and of those which are deficient; for example, among the common feeding stuffs it is well known that wheat bran, clover hay, and meat meals are richer in ash, while anyone who has fed hogs on a clear corn ration knows it is deficient in ash, as is shown by the fact that the hog fattens quickly but does not grow bone of sufficient size so that it goes down; that is, the body gets too heavy for the strength of the bone.

The compounds— carbohydrates and fat—are known as the heat and energy producers. Each is made of the three elements—carbon, hydrogen, and oxygen; in the carbohydrates the unit of hydrogen and oxygen being in the proportion of two to one, while in the fat there is a larger number of carbon and hydrogen units in the proportion to the oxygen.

The cell walls—thin and tender in the growing plant, hardy and woody in the mature plant—form what is called cellulose or fibre.

The nitrogen-free-extract is the total dry matter of the plant, less the ash, crude protein, fibre and fat,—and is composed of the starches, sugars, pentoses and non-nitrogenous organic acids.

The fibre and nitrogen-free-extract, together constitute the compound that is termed carbohydrates. A feed stuff which carries a large percentage of carbohydrates is spoken of as carbonaceous. Thus most of the roughages except the legumes are carbonaceous, also corn and most of its by-products.

Glucose, or glucose-like sugars, are the only forms in which the carbohydrates can be used in the animal body, except milk sugars, which may be absorbed in minute quantities from the alimentary tract. The saliva secreted from the glands of the mouth contain a ferment, ptyalin, which partially changes the starches into sugars. Aside from this, the saliva moistens the food and thereby aids mastication. It is said by some authorities that an average-sized cow will secrete 112 lbs. of saliva in 24 hours. Ptyalin action may continue in the first part of the stomach; from the stomach most of the carbohydrates are carried on into the small intestine, and are acted on by the amylopsin.

There seems to be no ferment especially adapted to digesting the cellulose, and bacteria of the alimentary tract attack it.

The fats become broken up into glycerine and fatty acids, and become partially saponified. These soaps and the glycerine are absorbed by the intestinal walls, in the cells of which they are reunited into fats, and are given into the circulation as such. It is plainly evident that the fats in the feed stuffs fed to the animals indicate to a certain extent the character of the fat, after it has become absorbed and known as animal fat. Fats of a low melting point, when fed to animals, produce animal fat with a low melting point, and vice versa with fats of a high melting point; hence the reason why some of the dry feeds, barley and cotton-seed meal, produce a milk fat of which the fat globules are hard and require a higher churning temperature; also why corn and its products, linseed meal and some of the succulent feeds, produce fat of a low melting point and a soft butter unless the cream is kept at a lower temperature,

The uses to which carbohydrates and fats are put in the animal body are not materially different. Fat has a greater heat or energy producing value than the carbohydrates, which, as near as can be determined by the chemist, is supposed to be 2¼ times as great.

After the carbohydrates in the form of glucose have entered the circulation, it is found stored in the liver in the form of glycogen, and in very minute quantities in the muscles and blood. When work is done, the glycogen of the muscles is first drawn upon, then that which is stored in the liver. The glucoses may also be converted into fats and stored as body fat, thus it is seen that fats and carbohydrates practically do the same work—that of producing heat and energy, or storing up body fat.

Protein, the last of the compounds to be considered, differs from carbohydrates, in that it contains nitrogen, sulphur and sometimes phosphorus. The percentage of protein in a feed stuff is determined by taking the amount of nitrogen and multiplying by 6¼, as it is found by the chemist that about 16 percent of the plant proteins is nitrogen. Protein is made up of various proteids, and varies more or less according to the source, although as yet there is not a very clear understanding just how the part they play in animal nutrition varies.

Protein digestion begins in the stomach, and follows in the small intestine. The protein is attacked by ferments and is split up into simpler compounds which take up water and become more soluble.

After being split up and acted upon by the various ferments until they are in their simplest forms, animo acids, and are soluble in the intestinal juices, they are then ready for transference through the intestinal walls

and constitute the nitrogenous building material out of which the protein tissues of the animal body are built.

Most of the digestion and absorption takes place before the large intestine is reached, and the contents of the large intestine consists of undigested substances of all kinds taken in with the food—bile salts which have escaped resorption, water, mineral salts, and fragments of the lining of the small intestine. A small amount of digestion may occur here if ferments have escaped from the small intestine and there is more or less bacterial action. Any soluble products which may arise here as a result of digestion are absorbed. The waste which finally escapes from the large intestine forms the excrement or feces of the animal.

Considering the process of digestion it can readily be seen that it is not the food which the animal eats, but that which is digested and finally absorbed into the animal body, which actually counts. Again, for an economy of the food nutrients, it is desirable that they be in the right proportions to prevent the animal body from wasting them.

All the tissues of the animal body are continually breaking down and wasting away, and are being continually repaired from the new food nutrients which are assimilated. The nitrogen passes from the body in the urine, and the amount passing is considerable; even if protein is entirely withheld, the nitrogen continues to be thrown off from the body in this manner, first drawing upon the circulating protein and then at the expense of the organiced tissue. If the protein is increased until nitrogen equilibrium is reached, it will top the body waste, but in matare animals is not likely to result in storing up body protein.

If protein is fed in excess, it does not become an entire waste, as the nitrogen part may be split off and the remainder or non-nitrogenous part be converted into glucose; thus while the protein may do the work of the carbohydrates and fat to a certain degree, the carbohydrates and fat will not take the place of protein.

This does not, however, signify that it is an economical method of feeding. In both the plant and animal food the most expensive element is nitrogen, and so far as the animal feeder is concerned, when an excess is fed it becomes an entire waste, also is expensive from the standpoint of the animal body as the cost of digesting, assimilating, and freeing the body from the excess nitrogen uses up considerable energy and overworks the animal body, especially the excretory organs.

What is the Actual Selling Value of a Cow?

This question is often asked by the farmer and the man who does not ordinarily deal in cows. It is a question well deserving an answer, and should demand much thought and consideration on the part of the man who attempts to make a reply. The value of a cow should depend largely upon what she is capable of doing at the pail. If she is a good producer, she is worth more than an ordinary cow or scrub, all will admit that, but just how to estimate roughly the selling value of all cows has been problematic. In a recent talk before the Jackson's Farmers' Club, the writer attempted to answer the question of values on cows regardless of breed, and will attempt to put on paper as full a reply as was given them.

THE COMMERCIAL NALUE.

The commercial value of a cow now and possibly for all time to come, should be based upon first, her individuality. She must be sound, a sure breeder, and between the ages of three years and eight, as a first consideration, granting this, her value will depend upon her record or possibly her estimated record if the buyer has a speculative turn of mind.

In times past, the value of a cow has been largely an estimated value, and with this estimate, the buyer often took into account the looks more than any other one thing. This, in so far as the buyer is able to read the relation of form to production, is a most excellent way of judging. The more modern way of fixing the price would be to name it upon a cow's ability during her lactation period. This necessitates testing of a herd, but no thoroughly practical dairyman would think of conducting a dairy without doing this so the testing of itself is a new thing. My method of estimating the value of a cow would certainly be an incentive for all farmers to weigh and sample the milk from their herds.

The average Minnesota scrub cow is worth about $48.00 for the dairy, if she is fat, she is worth more for beef than for dairy purposes. This cow produces about 160 lbs. of butter in a year according to Prof. Haecher and Commissioner Winkjer. This is arrived at by adding 1.5 to the butter fat for overrun. The average price paid for butter is 30 cents the year round or thereabout. If the average cow produces 160 lbs. of butter in a year, which will sell for 30 cents, she will produce in gross profit $48.00. If the cow is capable of making 320 lbs. of butter in a year, she is worth double this amount or $96.00. If she is sound and can do this she is worth the sum mentioned regardless of her looks, but the chances are very good that, in order to make as good a showing as this, she had had at least one cross of good blood in her veins.

The practical man with the cows will at once admit that this will catch the selling values very near in most cases. But when a man asks over $100.00 for a grade cow the buyer usually thinks the seller is unreasonably high in his prices. Let us stop to consider that, if a grade is capable of producing 460 lbs. of butter, you have very little more food of maintenance to feed her than you need for the 160 lbs. cow, and still have only one cow to care for and milk. The 460 lbs. butter cow should be worth $138.00 to the buyer, and the seller ought to receive more for a cow of this kind on account of her skill in breeding, and to pay the actual expense of testing his herd. The commercial value then, regardless of any sentiment connected with the sale of a good dairy cow, should be based on her yearly production. A buyer can afford to pay as much cash as she will return gross profit in a year. If a grade cow has enough good top crosses to cause her to produce 550 lbs. of butter, she should be worth in any common dairy, where she is not to be turned off for beef, $165.00. If she will produce 550 lbs. butter in one year, she should produce a reasonable amount every year. Aside from her increased value because of her individual ability over that of the average scrub, this ability is transmitted to her heifers, and they, in turn, are more valuable to keep in the herd.

WHAT IS THE REAL VALUE OF THE PURE BRED

The commercial value of the pure bred is a difficult matter to decide. It will never be answered accurately because there are animals whose prepotent powers can never be estimated by rule. In general, however, a pure bred is worth four times as much as a grade, and we get at this valuation by the selling value of the bull calves. Many breeders are not selling their pure bred females so no returns can be figured on them only in the building up of their herd, because until either they or their progeny are sold, they have no greater value so far as production is concerned than a high producing grade. The real additional value because of the pedigree, comes when stock change hands.

A dairy cow lives to the approximate age of 10 and ½ years. She drops her first calf at 2½ years, so that she should give her owner eight calves during her life time. Half of these are bulls which, from a grade cow, have little or no commercial value, but, if from a pure bred cow, they can be sold according to the record of the dam. If she is one of those 350 lbs. of butter cows, as she must be in order to be worth $400.00, the average of her bull calves, if sound, would be worth $100.00 each. Four of these are worth $400.00, and the owner has the heifers to pay the interest, risk and investment. If a pure bred has made an honest record of 600 lbs. butter in a year, she is worth in round numbers $700,00, and the average estimated value of her bull calves would be the same amount until it is learned by actual trial that they do not transmit their inherited ability to their daughters.

You ask, as we do not give the sire credit for his inherited ability at production? Most certainly, we go on the supposition that a cow is always bred to a bull with at least as good blood lines as she herself has. This should be, and nearly always is, the case in common herds.

A heifer at one year old is worth about half the value of her dam, not more, because it requires a year's feed and care to bring her into milk and the risk in buying heifers is much greater than when buying cows that have had at least one good calf.

ESTIMATING THE VALUE OF A YOUNG BULL.

To return to the matter of estimating the value of a pure bred bull calf either to sell or place at the head of a herd.

This article has based all valuations on yearly records, but seven and thirty day records are also of value in estimating what a cow may be capable of doing during her lactation period, and especially so if this record for seven days is made ten or eleven months after calving.

In estimating the commercial value of a bull calf, the record of his dam is of first importance, then the records of at least two of the sire's A. R. daughters from different cows. These should be added together and an average found. To this average, add the record of the calf's dam, and average again. If the sire of the bull calf in question is not old enough to have tested daughters, an average of the sire's estimated inheritance should be struck by adding the record of his dam and either two of the grandsire's A. R. daughters' records or the record of his dam, and go one step further back for tested daughters. It will thus be seen that the first dam's record counts half in fixing the young bull's value, while the dam of the sire only counts one fourth.

Record prices of thousands for pure breds are only warranted as a rule for a splendid individual backed by a long line of record dams and producing sires which gives reasonable promise that the young bull must get producers. If when a bull comes to maturity, a large percentage of his heifers are much better than their dams, the bull is priceless in value if kept in a good herd.

TO RECAPITULATE.

1. The value of any dairy cow, granting she is sound and not too old, should be based upon her ability at the pail.

If she produces 160 pounds butter in a year at 30 cents, she is worth $48.

If she produces 260 lbs. butter in a year at 30 cents, she is worth $78.

If she produces 360 lbs. butter in a year at 30 cents, she is worth $108.

If she produces 460 lbs. butter in a year at 30 cents, she is worth $138.

If she produces 560 lbs. butter in a year at 30 cents, she is worth $168.

If she produces 660 lbs. butter in a year, at 30 cents, she is worth $198.

2. The estimated value and selling price of a yearling heifer is half that of her dam as figured above.

3. The estimated value of a pure bred cow is four times that of a grade based on the above figures. By this way of figuring, the 660 lbs. pure bred is worth $192.00. As a matter of fact, tnre 160 lbs. pure bred is not worth anything if that is all she is ever capable of making.

4. The estimated value of a pure bred bull calf is the average of the sum of his dam's record in pounds of butter taken with the average production inheritance of the bull's sire; for example, if a well marked and good individual bull calf is out of a 400 lb. fat dam or 480 lbs. butter, as we have been figuring, and his sire has two A. R. daughters whose average record is 500 lbs. fat or 600 lbs. butter, or his dam has a record of 500 lbs. fat, and the grand sire two A. R. daughters with an average of 500 lbs. fat, and 600 lbs. butter, we add the 480 lbs. and 600 lbs. together, divide by 2, and we have 540 lbs. of butter, multiplied by 30 cents gives $162.00, the estimated selling price of the bull calf.

5. Some animals whose prepotency has been demonstrated are priceless in building up a good herd.—By George P. Grout in Guernsey Breeders' Gazette.

A representative enjoyed the privilege one day last week of a stroll into the orchard of Mr. William Miller, in Clarence. The orchard was one mass of white and pink bloom, and with the green of the North Mountain in the background, presented a picturesque scene. One tree, however, particularly attracted our attention. It was of the Bishop Pippin variety, and is said to be the largest apple tree in Canada. From the huge trunk diverge a dozen or more branches, each as large as ordinary apple trees. Mr. Miller has taken over twenty-five barrels of fruit from this tree in one season, and the Bishop Pippin is not considered aprolific variety.—Monitor Sentinel.

The calf on the average farm is sadly neglected. It's a wonder that many of them turn out as well as they do.

Value of Dragging Earth, Clay and Gravel Roads

Maintenance at Minimum Cost With the Split Log or the Steel Road Drag.

The maintenance of earth, clay and gravel roads, which require attention more often than other types, and if they do not receive that attention, quickly become rough and unfit for any kind of traffic, is a problem that has not yet been completely solved. In the rural sections of Canada there are thousands of miles of these roads, some of them good, but many of them in a disreputable condition from lack of proper repairing. The statute labor system cannot be commended for results in road improvement. In fact, there appears to be but little system "system" in this method of maintaining the country roads. Road maintenance is one of the most important problems with which our rural municipalities have to deal, and the solution, whereby we will have good driving roads at all seasons, warm or cold, wet or dry, is attracting more attention to-day than ever before.

The road drag, the simple framework, whether it be made of logs, planks or of steel, is proving its worth in the maintenance of earth roads, and slowly but surely it is coming ito general use. The Manitoba Good Roads Association has done more than any other body in Canada to put forth the value of the road drag. The annual split-log drag contest of this association is creating more and more interest every year, and the 1913 contest, the results of which will be announced later in "Good Roads Canada", promises to be the best yet held. The contestants are provided with a road drag, and are each given a section of road to work on. At the end of a specified time the judges make a tour of inspection, making the awards. In this way public interest is centered in the road drag, and as a result it is coming into general use for the maintenance of Manitoba's earth roads, of which there are many miles in the rural sections.

The Chatham Automobile Club, of Chatham, Ontario, also deserves credit for bringing the road drag to the attention of the farmers of that district. Six split-log drags were purchased by the club and distributed among the farmers to be used on the roads on which their farms fronted. The results are most satisfactory, and the farmers, some of whom were at first doubtful as to the success of such an experiment, are more than pleased.

The split-log drag, as invented by D. Ward King, is the best known road drag, but the steel drags which several bridge companies are putting on the market, are meeting with success. In the March issue of "Good Roads Canada" a general description of the construction and use of the split-log drag was published, and, complying with numerous requests, some of this is repeated.

In construction, the split-log drag is a very simple affair, so simple, in fact, that mistakes are often made in building it. Two half-logs, preferably of dry red cedar, from 10 to 12 inches in dianeter, and from seven to eight feet long, are the principal parts, the heavier and better one being used in front. At a point in the front slab four inches from the end that is to be nearest the middle of the road, a hole is bored for a cross-stake, and 22 inches from the other end another hole is bored for another hole is bored for another cross-stake. A third cross-stake goes from midway between the two end ones. The cross-stakes should be about two inches in diameter, of strong, straight-grained wood, to withstand the strain when the drag is in operation. The distance between the two logs is thirty inches.

From the end of the back log that is to be nearest the centre of the road, measure 20 inches for the centre of the hole in which the first cross-stake is to fit. When this stake is in place, the end of the back log will be 16 inches nearer the centre of the road than the end of the front log. The holes for the two other stakes may be located by measuring the same distance on the back log that there is between the stakes in the front log. This leaves a space of six inches on the back log at the end to be nearest the edge of the road. A brace about 2 by 4 inches in diameter is then placed between the ditch ends of the two logs, so that it will be about one inch above the ground at the front, and slightly higher on the rear log. This frame should be made firm and strong, but the mistake that is often made is of having the logs too heavy. The drag should be light, the cutting edge of the logs and the ease with which it can be handled being of more importance than the weight, which may be varied according to the nature of the road by loading the frame with planks. An iron plate about three inches wide and a quarter of an inch in thickness, to extend from the hitch end of the front log to the middle of the log, to act as a blade, completes the drag. This last piece is firmly bolted on the flat forward side of the front log, so that the lower edge extends a trifle below the edge of the log. This should either be cupped or have a wedge placed under the lower edge so that it will be perpendicular and will have a greater cutting force.

A platform of boards, on which the driver stands, is placed over the cross-stakes, and the driver uses his weight to keep the drag running smoothly. This cannot be explained, but will be learned with practice.

An ordinary trace chain is strong enough to draw the implement, and is fastened through a hole in the ditch end of the log. At the end nearest the centre of the road, the chain is fastened around the cross-stake, and passed over the top of the log, so as to allow the earth free passage along the face of the slab. This completes the outfit, and after a little practice the driver will find it easy to manipulate.

Squared timbers are of little use for a drag because, having a flat surface against the road, they slide over it instead of cutting in. A fairly serviceable drag may be made of strong planking, but it is not as successful as the split-log drag.

The road drag is not an implement for use in moving large quantities of earth, nor does the maintenance of an earth road require the use of such an implement. A consideration of the theory of road dragging will help to make the use of the drag more fully understood.

THEORY OF ROAD DRAGGING.

If a sample of moist earth is taken from the traveled portion of a road over a gumbo, clay or black prairie soil, it will be found practically impervious to water, as may be proved by forming a roughly shaped dish of damp earth and filling it with water. It will be noticed that the dish is practically water-tight.

Earth in this condition is what the clay workers call puddled. It has been worked and reworked by the carriage wheels and animals' hoofs until nearly all the traveled portion of a sticky muddy road is covered with a layer of this impervious, puddled earth.

As usually found on most of the roads, this puddled earth is full of holes and ruts, which are filled with water that cannot escape throdgh the impervious soil. As long as the water remains the soil cannot dry out and the road is kept in a most uncomfortable if not impassable condition.

It is also a matter of observation that this puddled earth when compressed and dried becomes extremely hard. On these two facts, the imperviousness of puddled earth and its hardness when dried, rests the theory of road dragging.

THE EFFECT OF DRAGGING

When the road drag is properly used, it spreads out the layer of impervious soil over the surface of the road, filling up the ruts and hollows, until a smooth surface is secured. As a small amount of material is always to be pushed to the centre, a slightly rounded effect will be given to the road, which may be increased or decreased as desired by subsequent dragging. By forcing the mud into the hollows and ruts, it is evident that the water must go out, which it does by running off to the side of the road. The drying out of the road is thus much facilitated, and the road is made immediately firmer because the water is squeezed out.

The effect of traffic over the road tends to press down and thoroughly compact each thin layer of puddled earth which the drag spreads over the surface every time it is used. After the first few draggings, it will be noticed that the road is becoming constantly smoother and harder, so that the effect of a rain is scarcely noticeable, the water running off the surface, which is so smooth and hard as to absorb but little of it.

INSTRUCTIONS FOR DRAGGING.

The following points are to be borne in mind in dragging a road:

Make a light drag, which is hauled over the road at an angle, so that a small amount of earth is pushed to the centre of the road.

Drive the team at a walk.

Ride on the drag; do not walk.

Begin at one side of the road, returning on the opposite side.

Drag the road as soon after every rain as possible, but not when the mud is in such a condition as to stick to the drag.

Do not drag a dry road.

Drag whenever possible at all seasons of the year.

If a road is dragged immediately before a cold spell it will freeze in a smooth condition.

The width of traveled way to be maintained by the hrag should be from eighteen to twenty feet; first drag a little more than the width of a single wheel track, then gradually increase until the desired width is obtained.

Always drag a little earth towards the centre of the road until it is raised from ten to twelve inches above the dege of the traveled way. If the drag cuts in too much shorten the hitch.

The amount of earth that the drag will carry along can be very considerably controlled by the driver, according as he stands near the cutting end or away from it.

When the roads are first dragged after a very muddy spell, the wagons should drive, if possible, to one side until the roadway has a chance to freeze or partially dry out.

The best results from dragging are obtained only by repeated applications.

Remember that constant attention is necessary to maintain an earth road in its best condition.

Following are some points to be kept in mind, in the operation of the drag. It is hoped that they will not discourage prospective users of this efiective implement, because one thing should not be forgotten, that the poorest drag used in the poorest manner by a man who wants to learn will surely improve the roads.

No. 1—The Length of the Chain.—The length of the chain regulates the hold taken on the earth. To make the chain longer is equivalent to putting weight on the drag. If your drag is too heavy, shorten the chain.

No. 2—The position of the Snatch Hook, Which Attaches the Double-trees.—To remove much dirt or cut small weeds, hitch the hook close to the ditch end of the drag and stand as nearly on the end of the front slab as is safe. Drive very slowly when thus hitched. This one hitch seems to be the hardest to learn. The others suggest themselves.

No. 3—Position of the Driver on the Drag.—To move dirt, see above. In a soft spot, stand on rear slab. On a hard spot, stand on front slab and drive slowly. If the drag clogs with straw, weeds, sod or mud, step to a point as far as you can get from the ditch end of the drag. To drop dirt in a low place, step quickly from ditch end to other extreme. To fill a low place or mud hole nicely is the severest test of skill with a drag.

You may become thoroughly disgusted when you first make the effort. But remember, it will not be the fault of the drag if you fail.

No. 4—Presence or Absence and Sharpness or Dullness of the Steel—The steel may project half an inch below the wood at the ditch end of the steel, but should come up flush with the wood at other end of the steel. After a clay or gumbo road has been dragged four or five years, the soil becomes so tough and putty-like that one must study it closely to know what to do. Sometimes use sharp edge of steel; sometimes dull edge. Holes are bored in both sides of the steel so that it can be turned upside down and the same bolt holes used, and sometimes the plain wood.

This can be learned only by experience, and you have several years in which to study the problem.—Good Roads Canada.

Ayrshire Record

White Rose, owned by S. R. Cairns, Lower Freetown, P. E. I. recently led the Mature Cow Class in the Ayrshire Record of Performance with a record of 10,609 lbs. milk, 3.18 per cent fat, 404 lbs. fat.

Are you prepared to spray your potato fields?

Fungus and insect pests will very materially reduce the returns that you should receive for your labors if you do not take time by the forelock and spray.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

DEMANDS FOR GRADUATES OF AGRICULTURAL COLLEGES

We recently had a conversation with Principal Cumming who had just returned from a trip to the United States and Upper Canada where he went for the purpose of securing additional members for the staff of the Nova Scotia Agricultural College. He was telling us something of the difficulty of securing well trained men for such positions as he had in mind and he added that the demand for well equipped graduates of Agricultural Colleges was far beyond the supply. There are, he said, actually more positions open for good men than there are men to fill them.

The time was, he continued, when it was comparatively easy to secure the services of a good man for a position in an Agricultural College or Department of Agriculture, but every single man, whom he interviewed, with respect to positions in Nova Scotia, had at least one alternative offer and instead of these men seeking positions, positions were almost begging them.

Prof. Curtiss, Dean of the Agricultural College at Ames, Iowa, writes as follows in the College Magazine of May 1913, in regard to the demand for agricultural graduates of that institution: "We have more demands for the men trained in Agriculture than we can fill. Our enrolment of students in all year agricultural courses is now about 1,100. That is about twice as many as we had seven years ago. Yet with all this increase and with the larger number of graduates turned out every June the demand for trained men is greater than can be supplied. This is due to several causes. More of our men are going into farming; then agricultural education is expanding very rapidly, and now the Agricultural Advisor Movement is taking all the competent men it can secure. I believe that the time is not in sight when the demands will be less because we are just coming into the greatest development of agriculture."

Th same magazine contains a paragraph in regard to a Nova Scotia boy, Mr. K. G. MacKay, of Scotsburn, Pictou Co., N. S., who recently took his Master's degree from the Iowa State College:

"Mr. K. G. MacKay, a post graduate student, who recently took the examination for his Master's degree, has gone to Regina, Sask., where he will take up a position of Assistant Dairy Commissioner.

Just befor leaving, Mr. MacKay received a letter from the British Government asking him to accept a position in India as Deputy Director of Agriculture of that country. There is a handsome salary connected with the position and Mr. MacKay will likely take it up if he can release himself from the position he has in Regina."

The Agricultural College graduates in Canada are sought for for positions in connection with the Agricultural Colleges in the Provinces, with the various branches of the Dominion Department of agriculture, by such large railway corporations as the C. P. R. and by various manufacturing corporations such as fertilizer factories, packing houses, wheat mills, etc. President Creelman of the Ontario Agricultural College tells of one graduate of that institution who, a year ago, accepted a position as Chemical Advisor to a flour mill near Winnipeg at an initial salary of $1500 per annum. Within a single year this expert saved the mill thousands of dollars and his salary has been doubled.

Graduates of the Nova Scotia Agricultural College stand high among these men. The following are some who occupy prominent positions: E. S. Archibald, Dominion Animal Husbandman, P. H. Moore, Manager Dominion Experimental Farm, Agassiz, B. C., E. Lewis, Superintendent of Fairs and Institutes, Alberta, W. V. Longley, District Representative, Minnesota, N. MacKay, W. H. Porter and J. G. Taggart, District Representatives in Ontario, etc.

Prof. J. H. Trueman, who now comes back to his native country after occupying positions in the United States for twenty years, is an example of one of the older graduates. Prof. J. C. Blair, Head of the Horticultural Department at the University of Illinois, a former graduate of Truro, occupies one of the foremost positions in his line in the United States. Many more might be mentioned but the above list conveys some idea of the opportunities which are presented to well equipped graduates of Agricultural Colleges. The Nova Scotia Agricultural College graduates referred to in the foregoing are commanding salaries from $1200 to over $5000 per annum.

Principal Cumming stated in conclusion that the Nova Scotia Agricultural authorities take the greatest pride in their graduates who are carrying on farming in their own native Province. Over 90 per cent of the Truro graduates are so engaged. Nevertheless, he feels that the Maritime Province boys should know something of the opportnities in other lines which an agricultural college education affords. He states that it is only a matter of a few years until some 12 to 18 more graduates will be required to carry on demonstration work in the counties of Nova Scotia and many similar lines of work are opening up which will be filled almost as rapidly as trained men can be secured. With the strengthening of the faculty of the Nova Scotia Agricultural College, which we have from time to time referred to in our columns, that institution, which has already turned out so many good men, will be in a better position than ever to supply the experts that are being sought from the Atlantic to the Pacific in Canada as well as in other countries of the world.

WEEDS

The Canadian farmer sustains a loss each year of millions of dollars due to weeds. The farmer who allows weeds to grow in his fields to the damage or exclusion of his crops, loses something more than the money value of the crops. He loses the respect of his neighbors and of every traveler along the highway and more than that, he can't help losing some of his own self respect.

Not all cases of weeds are due to carelessness or ignorance, but much of the enormous loss could be saved if the farmer understood or appreciated the damage done by the presence of weeds in his fields. It is our observation that, as a rule, dairy farmers are among the best farmers, and yet we occasionally see examples of regret and wilful ignorance that makes one blush for their kind. The successful dairy farmers are not growing weeds in lieu of crops.

A few miles ride through any country will show fields well drained and cared for. No weeds there and, on the other hand, fields so poorly plowed and prepared for planting that weeds have the right of way over everything else.

We trust all our readers are waging a war against noxious weeds this season so that passersby may not have the opportunity of saying "I passed by the field of the slothful and him void of understanding and, lo, they were overgrown with weeds."

AFTER HIGH SCHOOL, WHAT?

Hundreds of young men, the sons of good dairy farmers, are putting the last touch on their high school education. In June they will receive a diploma which is the official statement of the school board that the student has finished the prescribed work offered by that school. After that, what?

Are they leaving the high school with an idea that their education is complete? Are they leaving the high school and the farm to seek employmentin the city? Have they an idea that the dairy farm offers nothing for a young man of their attainments? Or have they, through the wise guidance of father and mother, come out of the high school with a love for the dairy farm, determined to establish themselves in that work. If they are sustained by such a desire and have a determination to become the best dairy farmer in whatever community it may be their lot to make their home, there is still ahead of them the agricultural college and its offering for young men of that spirit.

The boy who wishes to become a dairyman and has had the good fortune to have lived his life thus far on a dairy farm,has just the foundation necessary to make this college training in dairy husbandry worth most to him.

If father and mother look at this thing right they will not, as too many parents do, wish a life of less work than they have had, but they will wish for their boy a life full of work guided by a better training for it than it was their fortune to get. Work never killed a man, but work without purpose or outlook has worried many a man into his grave.

You can wish for nothing better for your boy than that he may follow in your footsteps, not as you were compelled to go, but with all the experienceyou have accumulated plus the advantages of a technical training in dairy lines that will make him a better dairyman than you ever could be.

What is true in regard to training along dairy lines is also true in regard to horticulture and all other lines of farm practice.

This college training is not absolutely necessary but it will be a tremendous saving of his time, strength and energies in later years and will give him a personal power and ability to take advantage of opportunity in his calling as he cannot without it.

SPRAYING

Despite the fact that the most progressive fruit growers of the representative fruit districts of the Maritime Provinces and elsewhere have demonstrated that it pays to spray their orchards in order to be able to market a big percentage of their fruit in such a condition that it will be both profitable and creditable to themselves there are still too many, who, through skepticism or laziness do not follow this fundamental fruit growing practice.

The fruit growers who do not spray are a menace to the industry. Their orchards are veritable breeding grounds from which the various pests go forth to reinfest the orchards from which their kind had been exterminated by dint of hard work in previous years.

The members of the various co-operative fruit companies must spray their trees in order to comply with the rules which govern them. We believe the time is not far distant when compulsory spraying will be in force. An act of this kind would help to lessen the burden of the progressive fruit growers and would not in any way inconvenience those who do not spray at present as they would be more than amply repaid by the increased returns from their orchards. Their skepticism would soon be changed to ardent support.

The Calendar for the Nova Scotia Agricultural College for the year 1913-14 has been issued and is now available for distribution to all who may be interested in attending that institution. The College at Nova Scotia is equally free to all students from the Maritime Provinces. During this year large additions have been made to the buildings, the faculty has been increased so that the institution is in better shape than ever to afford the best instruction to its increasing number of students. Those who are interested should communicate with Principal Cumming, at Truro, who will send calendars on application and supply them with any information that they may request.

Advanced Agricultural Legislation in Nova Scotia.

The 1913 session of the Nova Scotia Legislature was very fruitful of bills providing for an advanced agricultural Policy. Notable among these were No. 29, providing for Demonstration Work in Agriculture; No. 30, for the encouragement of seed growing; No. 31, for the appointment of a Superintendent of Dairying; No. 32, for the appointment of a Provincial Entomologist; No. 33, for the increasing of grants to Agricultural Societies; No. 33, for the better organization of and the increasing of grants to County and District Exhibitions; No. 35, for the formation of the Nova Scotia Poultry Association; and No. 57, for amending the law for the Enrolment of Stallions adding thereto a provision for Optional Inspiction.

Several other Acts were passed which are of more or less general interest to the farmer. Among these were Bill No. 71, respecting Rural Telephone Companies, which provides that, if a farmer or group of farmers in any part of the Province wish telephone facilities, the Government will bonus a telephone line for the purpose to the extent of $20.00 per mile and that any existing telephone company must give such a branch line connection with the nearest exchange at a switching fee not to exceed five cents.

Bills No. 90 and 189 were passed giving farmers' "Fruit Produce and Warehouse Co-operative Associations" powers which enable them, in addition to buying and selling farm and fruit produce of all kinds, to also deal in spraying outfits, agricultural implements, fertilizers, feeds, flour and all manner of merchandise. There are now some thirty-five local co-operative Fruit Companies and the majority of them are united into the central "Nova Scotia Fruit Companies." Their former powers were confined to the buying and selling of fruit, etc., but this new Legislation greatly extends their powers adds to the practical value of their co-operation. New development in Nova Scotiestia is fraught with greater possibilities or is being more carefully watched both at home and abroad than this co-operative movement which is in line with recommendations that are being made all over the world in regard to the improvement of the farmer's business position.

Bill No. 19 "To Incorporate the Nova Scotia Veterinary Association" is of considerable interest to the farmer since according to this Bill, all practicing veterinarians must be members of the Nova Scotia Veterinary Association and it is illegal for anyone to practice unless he is a graduate of a recognized school or college and eligible for membership in the Nova Scotia Veterinary Association.

Farmers, too, are interested in the special road legislation passed at this session, which makes provision, in addition to the usual grants, for an expenditure of $10,000 per county upon special road work of a permanent character.

In regard to the more purely departmental Bills, already referred to, they are such as provide for a very progressive policy along agricultural lines.

The Bill for the establishment of Demonstration Work provides for demonstrations throughout the Province in the growing of Field Crops as well as for other farming operations and for the appointment of men, corresponding to the District Representatives of Ontario, to carry on this work in the respective counties of the Province. A beginning along this line has already been made in Cape Breton.

The Act for the Encouragement of Seed Growing provides for the further extension of Field Crop Competitions Seed Fairs, etc., with a view to encouraging farmers to grow more of their own seed and that of a better quality that heretofore.

The Act for the appointment of a Superintendent of Dairying provides for a very progressive policy along this important line. Heretofore, this Department has been largely under the direct control of the Secretary for Agriculture, but it has now assumed so much importance that it demands the undivided attention of a man. Mr. W. A. MacKay, formerly the successful manager of the Scotsburn Creamery, the most progressive creamery in the Maritime Provinces, has been appointed to this position and has already done very effective work.

The similar Bill for the appointment of a Provincial Entomologist is the result of a determination on the part of the farmers in general, and the fruit growers in particular, to keep Nova Scotia, as far as possible, free from these pernicious pests, which have, in other countries, caused so much trouble and added so heavily to the cost ol raising field produce and fruit. Dr. Matheson, who has been appointed to this important position, is a Nova Scotian and a distinguished graduate of Cornell. He held for two years a similar position in one of the States of the Union. Immediately following his appointment, special regulations were passed with respect to the control of nursery stock, etc., shipped in from other Provinces of the Dominion and the result has been that already the Province of Ontario has appointed a Provincial Entomologist and the managements of the large nursery plants are arranging to rid their plantations of the San Jose Scale and other pernicious pests.

The increase of grants to Agricultural Societies and Exhibitions is also a part of the progressive policy which the Department of Agriculture is carrying on. The number of Agricultural societies has grown from 164 in 1905, the year when the college was established, to 210, and the local Exhibitions during the same period have increased from three to twelve. These Agricultural Societies devote their attention especially to the purchase and maintainance of pure bred sires and under the superintendence of F. L. Fuller the character of the work has rapidly improved. In regard to local exhibitions, their whole development has been largely a matter of the past seven years, during which time their numbers have not only increased but their grants also from less than $1000, in 1905, to six or seven times that amount at the present time.

The Bill providing for the organization of the Nova Scotia Poultry Association is a very important measure. During the past few years, the poultry enthusiasts have been doing excellent work but they have not received that degree of assistance from the Government which the importance of the industry warranted. The Nova Scotia Poultrymen at the Agricultural College during the recent Short Course and the present legislation represents the results of their deliberations.

The Bill for the Inspection of Stallions is an amendment to the bill for the Enrolment of Stallions passed in 1912. This amendment provides for the Optional Inspection of Stallions offered for public service in Nova Scotia. Under the bill at present in force, a large enrolment has taken place and it is already evident that much good is bound to follow this Horse Improvement Legislation. Not a few of those whose horses will only enroll in class C. are making enquiries for pure bred horses that will enrol in Class A. With the added provision for Optional Inspection, the bill is bound to prove even more effective so far as Horse Improvement is concerned.

Altogether, the Legislation of 1913, portends a most progressive policy on the part of the Department of Agriculture. The anticipated Federal Subsidy for the encouragement of agriculture will, to a large extent, facilitate these measures and will no doubt lead to still greater advancement in future years.

Soiling Crops for Hogs.

All authorities on the economic production of pork emphasizes the importance of the soiling crops for hogs. There are a number of crops that are fairly well adapted to soiling purposes that are very valuable as pork producers. Probably rape ranks first in this respect. There are others, however, such as alfalfa, clover and peas, that are exceedingly valuable and well worth any farmer's attempt at growing them. The peas may be grown in conjunction with oats and yet be very valuable. Another crop that has considerable value as a soiling crop, especially early in the spring, is fall rye. The legume hay crops are frequently objected to as soiling crops on account of requiring so long to establish. Alfalfa and clover crops that are sown this year may be cut and fed as soiling crops in 1914, but under no consideration should stock be allowed to run on them. The high value of both these crops as roughage, (cured and in the green state) causes us to strongly recommend every stock owner to seed at least a small area of them.

Since the season is becoming somewhat too advanced for sowing peas and oats, excepting in very limited quantities for green feed for a short period during harvest, we would advise sowing a piece of well prepared soil to rape. It does not necessarily have to be put in on summer-fallow land. Any fairly well prepared land that has a relatively high per cent of moisture in it will grow a very satisfactory crop of rape. The rape would be sown with a drill on the level in rows 32 inches apart at the rate of four or five pounds per acre. Seeding it in this way is much better than broad casting or sowing from every sprout of the grain seeder because it allows room to work a cultivator and in this way cleans the soil of weeds and by forming a mulch conserves the moisture. Rape may be sown any time up till July 15 and will produce feed for hogs six weeks afterwards if weather conditions and cultural methods are at all favorable. Rape sown early in July will produce two crops in the season. Rape used as a soiling crop will produce more feed per acre than when it is pastured off. For this reason it is frequently advisable where the area of rape is limited to have the hogs on a turf pasture and cut and feed them so much rape each day. The hog raiser who has a piece of peas near the outbuildings would do well to reserve a small portion of it and enclose it with hurdles and allow the hogs to pasture it off part when the crop is still green and part when it is ripe. This plan has worked out admirably in a number of instances. Hogs while running in the mature crop will require very little meal, and will make wonderful gains. The meal for hogs on such pasture would have to be rich in carbo-hydrates.—Nor'-West Farmer.

A Review of the work of the Experimental Farms.

For more than a quarter of a century the Dominion Experimental Farms have been carrying on experiments to find out the best kinds of crops and animals and the best ways of handling them for profit. This has been going on not only at the Central Farm at Ottawa but also in the Maritime provinces, the Prairie provinces and in British Columbia. The benefits that have resulted to the Canadian farmer from this work are undoubtedly very great but still thousands of earnest men are not receiving the full advantage of what is being done for them. Perhaps many do not receive the reports and bulletins containing the information while others receive these publications regularly but do not find time to study out the lessons from them. In order to help especially this class of busy men and women there has been issued by direction of the Hon. Martin Burrell, Minister of Agriculture, a special bulletin containing the outstanding conclusions that have been reached during the 75 years that the Experimental Farms were under the directorship of Dr. Wm. Saunders recently retired.

This review which has been prepared by Mr. J. B. Spencer, B. S. A., Editor of the Publications Branch, tells of lessons that have been learned concerning fertiliziers, cereals, fodder crops, farm field work, live stock, horticulture, arboriculture, chemistry poultry, weeds and plant pests. In addition many of the recent developments of the farm system are enumerated. It is shown that not only have the farms and stations been increased in recent years to fourteen, but greater advancement is being made in all of the older farms. This review which is tastefully gotten up has been issued for free distribution by the Publications Branch of the Department of Agriculture at Ottawa.

Encouraging Horse Breeding in Newfoundland.

Mr. Harold McPherson, of Westertand, the late Agricultural Farm, St. John's, Newfoundland, has purchased the stallion, Rillington Statesman, registered in the Cleveland Bay Horse Society of Great Britain and Ireland No. 1717.

The Cleveland Bay, a hardy, powerful, yet fairly light and swift animal originated through a blending of the powerful charger of the middle ages, with the more active Barb and Arabian. The Cleveland Bay has lots of quality and substance with well defined sinews, large, clean, flat bones of a density equalled only in the Arab and thoroughbred. His long lineage gives him prepotence in impressing his splendid characteristics.

Rillington Statesman was bred among his native hills in the Cleveland Valley of Yorkshire. He is an excellent specimen, color deep, rich bay, height 16½ hands, weight about 1400 pounds. His action is high, free and open, his stride long, temper perfect; he is in all respects a perfect general utility horse, a free cheerful roadster, sure-footed, fearless of all objects and with marvellous endurance.

Rillington Statesman was entered for The Royal Show of England, 1912 but came to Newfoundland before the exhibition took place. His full sister "Rillington Attraction" then won highest honors of all Britain.

To stimulate the care for young stock and to encourage breeding better animals in Newfoundland, Mr. McPherson offers a $100.00 prize to the best two year old produced by Statesman; or a $300 offer will be made to purchase same outright (to be judged in 1916.) Westerland stock barred.

We congratulate Mr. McPherson for his enterprise in stimulating stock-raising in the Ancient Colony.

HORTICULTURE.

The "New Brunswick" Apple.

The omission of this important variety of apple from the prize list of the Fredericton Exhibition (Sept. 15 to 20) should be a matter of regret to all who have at heart the welfare of New Brunswick fruit growing. Attention of the management was called several years ago to this omission which was promised to be rectified. The original cause for dropping this valuable native apple from certain exhibition fruit lists, involves, of course, the old controversy New Brunswick vs. Duchess, concerning which there ought not to have been any controversy in the first place, and certainly none at the present moment, when New Brunswick stands fully recognized by the leading agriculturists of Canada, who have not only conceded our right to this apple but urged the desirability of keeping it distince from confusion with any others. On this point I can quote correspondence with Prof. Percy J. Shaw, of Truro; the Fruits Division, Ottawa, recognized it as a commercial variety in their last report of 1912; while the numerous exhibits at the St. John Apple Show, 1911, showed that growers would enter the apple under its true name if given an opportunity. The question ought to be finally and forever disposed of, on the ground of "authority" in the mind of anyone who will read the title "New Fruits" by Prof. Macoun, Dominion Horticulturist, in the April 1912 number of the
1912 number of The Fruit Magazine, B. C. "In the Province of New Brunswick," writes Prof. Macoun, "there are many apples originated in the province. Two of the most noted are the New Brunswicker and Crimson Beauty. The Dudley apple, which is also largely grown in the province, originated in Maine near the New Brunswick line and is said to have been grown from seed of the New Brunswicker."

What need for more to be said? Those growers who have been led to coosider our apple as nothing but the "Duchess of Oldenburg" might surely gracefully acknowledge their error. The distinct origin of the New Brunswicker is to be proved as clearly as that of many other discoveries. As our late Secretary for Agriculture, Hon. Charles Lugrin, wrote, "the word of Mr. Sharp, the discoverer, was accounted good on any other subject, and we do not see why it should not be so in this." The claim of origination rests not alone on the word of Mr. Sharp, but members of his family, and the late Darius A. Shaw, of Wakefield, who tended the nursery and picked the first fruit. If we grant that the New Brunswicker came from a seed, on scientific grounds alone we must recognize it, though I need scarcely say that as to the principles involved horticulture has been the last of the natural sciences to recognize, then, having come to do so only within the last few years. Those who wish to be fully informed on the subject should look over "Principles of Botany," by Bergen and Davis, 1906, Chapter XXXIX, Variation, Mutation and Origin of Species; and consult recent issues of "The Breeders Magazine". But though Botany is thus coming up into line abreast of other natural sciences, there are yet points to which the student will oeed to refer to the 1885 Report on Nomenclature of the American Onomatologist Union. Suffice for the present to say that there are serious blocks in the way of the advanced horticultural student, (1) lack of agreement among the rank and file of horticulturists as to what constitutes variety as distinguished from full species, (2) the antiquated and utterly worn-out notion that a system of names requires to be a system of classification (realtionship), (3) a positiveness of opinion about supposed relationships which our present knowledge of the laws of heredity does not warrant, and (4) the antiquated notion that fruit bearing plants can be classified (i. e. grouped according to relationship) by reference to fruit alone, a plan long ago attempted by botany but abandoned as misleading. These, however, are questions for the students, the educators of the next generation. The general reader would be more interested in the question, how if the New Brunswicker was a distinct variety it ever came to be supplanted, its name taken from it by the "Duchess" apple?

I have heretofore, had occasion to relate in some detail how the New Brunswicker originated. A seedling out of a lot of seed especially procured from Bangor, Me., of then well known varieties, to plant for new varieties as well as budding purposes in making a nursery. An exceptionally thrifty seedling from an unknown parent, possibly Aiexander, at once grafted onto an older tree, fruited. Other trees made as rapidly as possible, and about 1860 first orchard planted in Upper Woodstock, still living and producing, and in 1863 another orchard, Fisher's, Woodstock, and rapidly after that a great number of orchards around Woodstock. By 1875 and before 1880 the great nursery of Sharp's had stocked large numbers of trees in all parts of New Brunswick and Prince Edward Island and as far west as Massschusetts, and later at Vineland, N. J., New York State, Ontario and Manitoba.

Sharp also planted out the old Tingley nursery in Albert Co., and four large nurseries around Sussex, in root grafts, and a similarly stocked nursery at Houlton supplied many trees to New Brunswick and elsewhere. Thus the province was stocked all over with orchards of New Brunswicker, which are today flourishing and bearing condition. Many of these orchards are now masquerading as "Duchess." In the Western range J. S. Sharp's nursery operations, his trees, as well as his packed fruit came against "Duchess" which was first mentioned as a supposed Russian introduced into America. The influences pushing Duchess were the New York State nurseries pushing product into eastern territory, agents not content with claiming the New Brunswicker tress to be Duchess but going so far in P. E. I. as to assert that Sharp actually procured his trees of them! To compare and study the so-called "Duchess," Sharp bought two trees and planted them alongside a New Brunswicker orchard which we still own. In 1880, an event of some importance occurred, the Biennial Meeting of the American Pomoligical Society, a part of whose business was to catalogue existing varieties and recognize new ones. Mr. Sharp had formerly attended sessions of the society, but not this one. Mr. Sharp, however, prepared the report on fruits in New Brunswick, and will be duly found printed in the Society's report for that year in the N. Y. Public Library. It was handed in according to the printed record by a Mr. Grosvenor of Meductic, who attended a delegate though not a member of the Society. This report is important as being the first formal "listing" not only of New Brunswickers, but several other native varieties, including the Peabody Greening, Summer Harvey, and Honey Pink. In mentioning "New Brunswicker" Mr. Sharp added a few words—"It is not the same as Duchess. It is hardier and not so sour." At the next session, 1882, Mr. Grosvenor attended, so did Mr. S. L. Peters. Mr. Grosvenor made the report, which was condensed into a paragraph, naming a short list of thrifty apples as in the former report but presto! "New Brunswick" had been neatly flipped out and "Duchess" written in.

The succeeding reports have the same report as to this province. By so simple an operation as the twitter of a pen charged with writing fluid, the name "New Brunswick" has in effect taken from our extensive orchards, a proceeding for which there was no justification or any grounds. From his supposed friend Mr. Sharp deserved better. It is small wonder, then, that when the next edition of "Downing's Fruit Trees of America" came out, 1889, that "New Brunswick" was recognized, but placed as a "local name for Duchess." In 1890 at the First Convention of Canadian Fruit Growers' held at Ottawa, Mr. Peters, who was a delegate, being unable to attend, gave the report on the province and declared our flourishing and thrifty tree to be "Duchess," and steadily since, in certain exhibitions, the rightful name of our apple has been cut out. There are, it is true, some bearing Duchess trees in the province, but very few. I personally know every tree of bearing age in this locality.

The point taken by "Duchess" advocates is that the two cannot be distinguished. This is not the case either as to fruit or the tree itself. At the Grosvenor orchard, Meductic, are the two trees, and everybody in the vicinity knows the difference, calls them the "sweet" and "sour" New Brunswickers!

Commercially in this country they have not graded up to the New Brunswickers on the score of color, and would any grade, at best, as good No. 2's, as we used to grade.

It is also not so heavy a bearer, the orchards I know don't come up to more than half a good New Brunswick orchard in quantity let alone quality. For those who care to examine further, the tree itself shows differences in all this Northern country. The smooth limbs of Duchess are decidedly greenish in color, those of New Brunswicker's reddish. Of a bundle of 100 scions each, the New Brunswickers show strong with reddish in 95 per cent., the remaining 5 per cent being dark purplish all over like the Duchess. The leaves of Duchess are bluish-green, those of New Brunswicker yellowish-green. This "warm" tint which belongs in New Brunswick tint which belongs in New Brunswickers and not in Duchess, is, let it be known, the color nature provides for warmth, for protection from cold.

These comparisons are for this province, we do not go so far as to what they carry out in other districts, like Nova Scotia, in parts of which, as we have had information, neither our true New Brunswicker nor Crimson Beauty take on color in their fruit. No doubt, the resemblance to Duchess would be more marked there than here. Mr. Starr, of that province, informed me of some careful comparisons made by him in Nova Scotia, by grafting authentic New Brunswickers upon authentic Duchess. "I pointed out that his experiment did not provide a check against cross-fertilization, his fruit would likely be half Duchess and half N. B., and further, he had omitted to consider the very important fact of change occurring when plants are removed to a different climate. In neither case could his fruit be typical of the varieties. So unless comparisons keep in mind certain scientific principles they are utterly valueless. A glance back at the Apple Show of 1911, will show the confusion certain to occur to some extent even when we tardily put New Brunswicker back in its proper place. A number of exhibits, box and plate, of true New Brunswicker masqueraded as "Duchess". In the plate class for all New Brunswickers, out of seven entries there were two authentic Duchess, which were so manifestly inferior that they did not deserve awards. The judges, who were outsiders, seemed to have assumed that the fruit was correctly named and gave the prizes to the best colored fruit, and at last, three such, including the first prize, I traced to good old New Brunswicker orchards. Several persons entered what was to all appearances exactly the same identical fruit under the two names. But it seems to me that it is one thing to maintain as a matter of principle that both varieties are one, namely "Duchess," but quite another thing to so maintain, and at the same time enter the same fruit under both names. I cannot forbear speaking of the dilemma one well-known exhibitor got himself into. By an oversight he had placed his "Duchess" plate with the "New Brunswickers" and vice versa. I made discovery of the fact before the prizes were awarded; certainly as far as I could judge by the eye the samples were extraordinarily alike. Frankly, if I had been assured that they came from separate authentic trees, I should have to acknowledge much of what has been claimed by the advocate of "Duchess." Indeed, I would have to

Write for the Sta-Rite Book

IT'S a revelation, telling how the vexing troubles of gasoline engines have been overcome in the *Sta-Rite*.

The *Sta-Rite* has proven that it will give absolutely dependable service year in and year out at the lowest cost for fuel and upkeep. Stationary and portable models—1½ to 16 h. p.

say that as far as fruit alone went, they were the same. But when I called this exhibitor's attention to the oversight, my disposition being altogether friendly toward him, he astonished me by leaving the apples as they were and simply exchanged the labels. And he took a prize in Duchess class on what he had originally placed there labelled "New Brunswicker."

I trust there will not in future need to be any further discussion of this mooted subject. Error is often hard to eradicate. A slight dent on a surface will sometimes require long pounding to remove its trace. Let "Duchess" be taken simply on its merits, do not let it supplant an apple that for many years has had an honorable reputation, and should still be a means to no slight degree of advertising the apple growing possibilities of our province.

In the list of the Fredericton Exhibition it is not sufficient that New Brunswickers may be entered under "any other variety." The fact is, "Duchess," like the Cuckoo, has usurped the other bird's nest only in due course to throw the rightful fledglings out and occupy it himself.—Tappan Adney, Upper Woodstock, N. B.

Fertilzing the Orchard.

When doctors disagree, who then shall decide? This must run through the mind of many fruit growers who are following the various experiments in the fertilization of orchards. A while back the New York station startled growers with the broad statement that from many years' experiments there is nothing to show the need of additional fertilizers in the orchard, other than the soil carries. On the other hand, the Ohio station maintains that fertilization does pay, liberally. Much harm might follow either doctrine unless the individual grower knew the conditions of the experiments, and then carefully figured the proper course for his type of soil and climate. As a matter of fact the New York experiments were on a heavy type of soil, running strongly toward silt and clay loams. The Ohio experiments were on soil of a sandy nature.

It seems the Pennsylvania station is a step in advance of the other two, for the reason it located experiments in different parts of the state, on different types of soil, and then based conclusions thereon. Experiments were in commercial orchards, and under ordinary farm conditions. The Pennsylvania conclusions indicate that potash has little effect on the yield of fruit, but that nitrogen and phosphoric acid materially increased the yield. Rather contrary to the general belief, color and size seem to be little affected by any process of fertilization. It is argued that the color depends more on sunlight and maturity. One general statement is that if a fruiting orchard is making good annual wood growth, it is not advisable to add much fertilizer of any kind until after its value has been shown through careful trials.—N. E. Homestead.

Thinning Vegetables.

Because of limited space the rows of vegetables in a home garden are usually close together, and often the seed is planted thickly in order to have a large yield. This is a mistaken idea, as the plants cannot develop to their full size if crowded. Vegetables grown for their roots should be given as much space as a mature plant needs. The very early radishes which are ready for the table in three or four weeks can be thinned out as used, but the larger varieties should be allowed two or more inches of space. Beets can be thinned out and used for greens, giving those left to mature, about three inches of space.

Plants grown for their foliage, as lettuce, parsely, and spinach, need more room than those whose roots are edible, and those which bear fruit, need plenty of room in which to develop the fruit bearing branches.

Seeds of vining plants, as cucumber, melons, squash and pumpkin are usually planted thickly, as the early bugs and cutworms take some of the plants. Only three or four should be allowed to grow in each hill. Nearly all plants can be transplanted, some of them, as lettuce, and parsely, seeming to grow faster after being reset than before. The best guide as to the room needed is a good, reliable seed catalogue or garden text book, which usually gives the size of a fully developed plant.

Lenses for Fruit Growers.

Every fruit grower should have a hand lens as a pocket piece. It enables him to determine at once the causes of many things that otherwise might remain a mystery and to see many things of greatest practical importance. In winter it shows whether the buds have been winter killed or not, whether plant lice eggs are abundant on the branches, whether the San Jose scale is present, and numberless other points of great importance. In spring he can determine the effects of frost upon the blossoms the presence of minute insects, the quantity of pollen developed, etc. Throughout the rest of the year there are abundant opportunities for the use of these lenses.

These simple magnifying glasses can be bought at prices ranging from a few cents to several dollars. For ordinary uses the less expensive ones serve almost as well as the more costly ones.

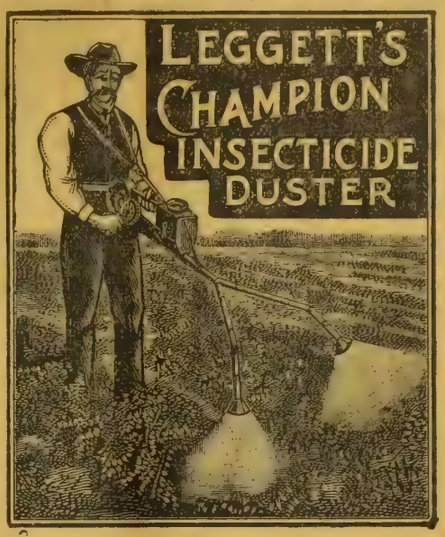
Cultivating Tomatoes.

Tomatoes should have the best of cultivation if profits are expected either in fresh tomatoes for the city consumer or in canned fruit. The soil must be mulched by careful cultivation; weeds must be kept down and the tomato plants kept growing rapidly until time for fruit to form. One of the sources of loss in tomato growing is the large per cent of faulty and immature specimens of fruit. Strive to reduce this per cent to a minimum.

Cultivate Berry Plants.

As soon as the strawberry crop is all gathered and sold, if the season be at all favorable it would be advisable to cultivate the berry fields, taking care not to destroy the runners nor to injure the roots of the plants. The right kind of cultivation will establish a mulch to reduce evaporation during the trying days of summer and it will also destroy many weeds that, if allowed to grow, would usurp plant food and moisture that the berry plants need.

I Don't Sell an Imitation



BUT I DO SELL THE GENUINE ARTICLE

All joints and Y's reinforced giving absolute strength where strength is needed

THE EASIEST AND SUREST WAY TO KILL BUGS

The Champion works faster—dusts two rows at one time—as fast as a man walks. Weighs only six pounds. Simple to operate—any farm hand, even a boy, can operate it. It gives better results at less expense than any other similar machine. No water to carry. Least danger, because the poison is kept at a safe distance from the operator. THIS IS NO IMITATION, being the Genuine Leggett's Champion Insecticide Duster, manufactured only by the originators. Leggett Bros., New York.

The Prairie Market for Fruit.

Fruit growers in Ontario, British Columbia and Nova Scotia are all alike interested in the capacity of the market in Western Canada for apples, and from time to time estimates of varying degrees of accuracy have been made of the total quantity received annually by the provinces of Manitoba, Saskatchewan and Alberta. Last summer the Dominion fruit inspectors assigned to these three provinces were instructed to take notes as to the quantity of apples shipped into their several districts, and make a report to this office at the end of the season. These reports have been complied with the following results: The total quantity of apples marketed in these provinces for the season of 1912 was approximately 495,000 barrels, of which Ontario supplied 238,000, British Columbia 75,000, Noba Scotia 18,000 and the United States 164,000.

In addition to the prairie provinces there is a large and growing market in New Ontario which will afford an outlet for increasing quantities of Ontario apples. If we consider the present population of Fort William, Port Arthur, Sault Ste. Marie, North Bay, Sudbury, the Cobalt district, and similar sections, we shall find that 60,000 barrels is a conservative estimate for the quantity of apples marketed in this section during the past season. The proportion of the above total supplied by the United States would probably not exceed ten per cent.—Canadian Horticulturist.

Enemies of the Strawberry

One of the enemies to which the strawberry is subject is the white grub. It is the larva of the May beetle. The grub when fully grown is about an inch and a half long and three-eights of an inch thick, nearly white, with a brown head. They are usually more numerous in old pastures and meadows than elsewhere, because their principal food is the roots of different kinds of grass.—W. A. Dier, Ottawa.

A land and apple show will be conducted in the new auditorium of the Winnipeg Industrial Bureau, October 10th to the 18th. The show will be an all Canadian one. In addition to liberal cash prizes, diplomas will be awarded for the finest general display of grains and fruits exhibited by provincial governments, fruit growers' associations, and other organizations.

A sprained ankle may as a rule be cured in from three to four days by applying Chamberlain's Liniment and observing the directions with each bottle. For sale by all dealers.

DAIRYING.

Preparing the Cow for Milk Fever.

J. G. R.—Could you advise any precautionary measure to be used in feeding and dieting a cow six weeks before freshening that is subject to milk fever?

If a cow is in good physical condition and flesh, it is well not to feed very much, if any, grain, but give a liberal amount of succulent feed such as silage and alfalfa and all the good hay, preferably of the legume class, that she will consume without waste. If there are no succulent feeds, we believe it well to feed about one pound of oil meal daily together with some other feed like bran or ground oats. We suggest the oil meal because of its tendency to keep the bowels of the animal in good condition, but the succulent feed will do that if it is obtainable.

The time has come when we need pay but little attention to the feeding of the cow so far as milk fever is concerned. We believe in feeding her in such a manner that it will put her in proper shape for calving. If milk fever follows, the simple cure, the air treatment, may be applied. Every good dairyman should provide himself with the necessary instruments for inflating the udder with air. These instruments are advertised in our columns, but a bicycle pump, milking tube and a short piece of rubber hose will serve the purpose. Great care should be taken to have the tube that is inserted into the teat thoroughly sterilized—boiling is one of the ways. Care should be taken not to touch it with the fingers or have it come in contact with anything before inserting. Futhermore, the teat itself and the end should be thoroughly washed with a disinfectant, using one part of corrosive sublimate, to one thousand parts of water, which is a very effective antiseptic. Great care should be used in handling the corrosive sublimate because it is a deadly poison. An eight or ten per cent solution of carbolic acid is also a good antiseptic. If the operator is careful in thoroughly sterilizing the instruments and the end of the teat before inserting the instruments, there is no danger of infecting the udder, and furthermore, the air treatment is practically an absolute cure for milk fever.—Hoard's Dairyman.

Cool the Milk Quickly and Thoroughly.

The warmer days are here. Each change of season brings its attending problems to the dairyman. As the days become warmer the danger from sour milk becomes greater. The strictest attention is required in sanitation and proper handling if the dairyman does not wish to be annoyed by the refusal of milk that has turned.

We wish to call the attention of our readers to three things in respect to cooling:

1. Cool immediately after milking. The dairy house should be equipped so that every pail of milk will be run over the cooler while the next cow is being milked.

2. Cool quickly—There is a vast difference in results between cooling in a large can in a tank of water and running the milk over a cooler which will immediately reduce the temperature to within two or three degrees of the water used for cooling purposes.

The most efficient coolers are those which will, in a few seconds, do this work.

3. Cool thoroughly—bring it to less than 50 degrees F. if possible. A little understanding of the life history of bacteria would enable the dairyman to appreciate these admonitions. Most of the bacteria get into the milk during the process of milking. In the warm milk they begin at once to multiply very fast, and they keep it up until the milk is cooled to 50 degrees or less, hence the necessity of immediate, quick, and thorough work in cooling.

Patrons Lose Money by Selling Thin Cream.

A loss of $2,700 on sweet skimmilk was sustained by the patrons of one co-operative Wisconsin creamery last year on account of the average per cent of fat in the cream being less than 30. This loss was calculated by getting the difference between the actual weight of cream received and what it would have weighed had it tested 30 per eent. The value of the skim milk was placed at 25 cents per hundred pounds.

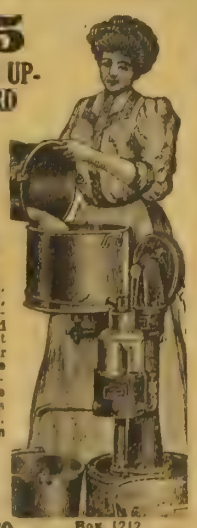
Prof. C. E. Lee, of the College of Agriculture, of the University of Wisconsin, reports this condition as more or less general, probably 75 per cent of the patrons delivering cream testing less than 25 per cent fat. The creamery patrons seem to believe that it is more difficult to test rich cream correctly, and that some cream is lost by sticking to the can. As a matter of fact, buttermakers always rinse the cream cans, while if a hauler collects the cream, the patron can avoid loss by rinsing the cans himself. There is no difficulty in determining accurately the test of rich cream.

Every creamery operator in Wisconsin should make an effort to have his patrons skim a richer cream, declares Prof. Lee. Several accomplished this by paying a cent or two less a pound of butterfat for cream testing below 25 per cent. Should all the factories pay according to the test and grade of cream delivered, the farmers of the state would be more likely to deliver cream that tested at least 30 per cent. Not only would each farmer then save from $25 to $40 yearly in skimmilk but the buttermaker would be able to turn out a much better product, as thin cream is difficult to handle properly in the creamery. Thin cream is thus seen to be objectionable from both the farmers' and the creameries' standpoint.

Cut Your Work Down One Third.

A decrease of labor with no diminution of income, but with general improvement of results, is a combination which appeals to any one. Labor-saving machinery and thoroughly efficient machines might just as well be used by dairy farmers as by any manufacturer. So the questions come: Have we efficient cows? Do they save or make work? Are they so good that they decrease both comparatively and actually the necessary amount of labour in keeping cows,

15 95 AND UP-WARD



AMERICAN SEPARATOR

THIS OFFER IS NO CATCH. It is a solid proposition to send, on trial, fully guaranteed, a new, well made, easy running separator for $15.95. Skims hot or cold milk, making heavy or light cream. Designed especially for small dairies, hotels and private families. Different from this picture, which illustrates our large capacity machines. The bowl is a sanitary marvel, easily cleaned. Shipments made promptly from WINNIPEG, MAN., TORONTO, ONT., and ST. JOHN, N. B. Whether your dairy is large or small, write us and obtain our handsome free catalog. Address:

AMERICAN SEPARATOR CO. Box 1212 BAINBRIDGE, N.Y.

EMPIRE CREAM SEPARATOR

A GENERATION ago ranchers would ride horse-back a day's journey to see an EMPIRE Cream Separator skimming milk on some farm where a dairyman was making a home for himself.

Many old-time ranchers eventually bought EMPIRES for themselves. Their sons and grandsons now own modern dairy farms and use modern EMPIRES. "Prosperity Follows The Cow."

The Third Generation of Empire Users

are even better friends to the EMPIRE than their fathers and grandfathers before them. EMPIRES have kept pace with dairying.

Our Baltic Cream Separator

is an exceptional machine at $25 to $45.

Sta-Rite Gasoline Engines are rite, start rite and sta-rite, just as their name implies.

AGENTS WANTED in Unoccupied Territory — Good men, who desire to handle our well known and popular machines, should write us at once. Write for Catalog 131

When your child has whooping cough be careful to keep the cough loose and expectoration easy by giving Chamberlain's Cough Remedy as may be required. This remedy will also liquify the tough mucus and make it easier to expectorate. It has been used successfully in many epidemics and is safe and sure. For sale by all dealers.

and at the same time increase the income? Every dairy farmer needs to answer such questions as applied to his herd, and he can answer them satisfactorily when he keeps dairy records.

A statement made by the Dairy Division, Ottawa, regarding Ontario cows last year, was that dairymen are keeping sixteen cows to do the work of ten. So it is quite possible to cut down work one-third, and rejoice because possessing more efficient cows. To the scrap-heap with the old junk!

A Quebec dairyman after one year of cow testing writes the Dairy Division that he now gets as much milk from his 32 selected cows as he used to get from his larger herd of 42 cows. Ten inefficients were beefed. Dairy farmers have not time to waste working for poor cows, so make sure that each one pays.—C. F. W.

Receipe for Preserving Butter.

A contributor to "Hoard's Dairyman" gives the following recipe for preserving butter, which he says has no equal or superior: Churn and then wash well the butter in several cold waters so as to thoroughly remove every trace of the buttermilk. Drain well, spread it thinly and salt to suit the taste, sprinkling the salt thinly over every portion of it. Work well, drain again, and set in a cold cellar of even temperature or in a refrigerator until next day. Then work it again by means of a butter ladle and pat it into little cakes size of an egg and pat each one of these cakes (one at a time) until thin as a wafer so as to drain off all the water possible. Pack in earthern jars, filling within one inch from the top. Now, wring a white linen or muslin cloth from cold water (cutting it to lap a little over the jar), and on the top of the cloth put fine salt until it comes level with the top of the jar. Put a sheet of paraffin paper over the salt, seal covers on with wax and tie brown paper down over it all so as to insure excluding the air. "Butter preserved by this method cannot (the writer says) become strong, provided that all the equipment has been kept perfectly sweet and clean by thorough washing and scalding. Fill your jars or crocks full at once; never leave them over for the next churning. The butter is liable to become strong if the jars are left open a day or two. If cattle have been allowed to pasture in wild fields, which has caused the butter to have any disagreeable taste, or should there be any disagreeable new grass taste to the butter, if packed by my instructions, every particle of it will draw out in short order. My customers pronounce my butter O. K., and will not buy elsewhere as long as I can supply them.

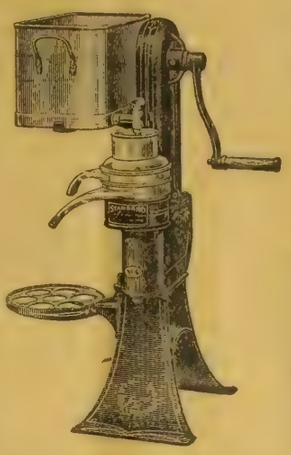
"The cloths which I use in my creamery are never used in any other kind of worv. I always wash, rinse and scald them each time they are used, and I hang them out in the air so that they will be fresh and sweet the next time they are to be used. Butter should be kept in a cold cellar of even temperature."

A Matitime Bred Cow Makes a Good Record.

On looking over the list of official record aged Holstein-Friesian cows that have recently been reported and accepted we find Minnie Rooker's Poem (7099), owned by the Colony Farm, Coquitlam, B. C., with a record of 568.1 ,bs. milk, 16.01 butter fat, equivalent to 20.01 lbs. butter, 80 per cent fat.

Minnie Rooker's Poem was bred by Logan Bros., Amherst Point, N. S. Our readers will probably remember Minnie Rooker's Poem as the junior champion Holstein female at Toronto in 1908.

For These Reasons



TO tell all the reasons why we believe your choice of a cream separator should be the Standard would be impossible in this space, but here are four: **First:** Because the

Standard

cream separator under ordinary conditions skims to .01 per cent. or less. It loses but one-tenth of a pound of butter fat in 1000 pounds of milk skimmed. The ordinary separator loses a full pound. **Second:** Because the Standard has a wide open bowl, and no cream or milk tubes to clog up. Everything easy to clean. **Third:** Because the supply can is more than a foot lower than on ordinary machines. No high or awkward lifting to do with the Standard. **Fourth:** Because the Standard has a self-oiling system and lubricates its working parts automatically all the time it is running.

The Standard will save more time and labor, and make more money for you, than any other cream separator. Try one and let the machine prove these facts.

FREE! Write for the Standard booklet, giving a full description of "The World's Greatest Separator," also folder entitled "Skimming Results."

LIVE STOCK.

Forage and Pork Production.

Economical pork production for our state depends a great deal upon the forage crops furnished the pigs and upon the quality and quantity of grain fed at the same time.

At the Station we have tried several forage crops for a number of years past and find that winter rye furnishes the earliest possible forage crop as it is ready to pasture with the first warm dry days of spring.

The area planted to winter rye needs only be large enough to forage the herd until the middle of June if the summer forage is planted early in May.

For the summer forage we find our brome grass permanent pasture to be fairly good but the plots planted to a mixture of 1 bushel oats, 1 bushel Canadian field peas, 3 lbs. of rape and 2 lbs. of millet have given us better returns and the plot planted to rape alone gave us the best returns of any one of the forage plots. We pastured these plots here on the Station farm at the rate of about 16 pigs per acre. Our plots were exceptionally good and I doubt whether it would be safe to count on more than 12 pigs per acre unless the forage is sown on an exceptionally good piece of land.

On some of the lighter soils I believe it more safe to count on running ten pigs to the acre. About the middle of June the pigs can be put on the rape or other forage crop and if the pigs are 10 weeks old and have learn to eat at the trough they will take hold and grow well from the first.

We do not count on the pigs making all their living and storing up a goodly quantity of fat on the forage. We feed our pigs about 4 to 5 pounds of a mixture of feed per hundred lbs. live weight, daily, in thick slop mixed at feeding time.

From our experience in the past we find that when the pigs are started out on a forage crop as rape or the mixture of rape, oats, peas and millet that a good mixture is about 7 parts of corn, 3 parts of shorts, 1 part of bran and 1 part of a concentrated protein feed as oil meal, field pea meal or tankage.

In case ground oats or barley is used in place of corn to make up the ration, bran had best be dropped as the bulk of the feed would be more than the pigs could make the best use of.

If desired to finish lard hogs off for market in better shape after they have pastured the plots all summer it would be well to have an acre of Gehu or another of the flint varieties ofcorn for each 15 hogs you have to finish. Turning them in about September 1st weighing 150 pounds the pigs ought to gain 50-60 pounds in September or as long as the foarging on the corn paying, we find, when we have some field peas that can be foraged over in connection with the corn.

The feed fed as slop may, after the first month, be dropped to 3½ to 4 lbs. per hundred live weight but I would not change the proportion until August when the protein concentrate as oilmeal, pea meal or tankage may be dropped out with good gains following.

By planning ahead from today and getting the forage crops planted early we may rest assured of cheap, well finished pork as the harvest in November and December.—E. J. Thompson, in Exchange.

Will kill every fly in your house or store. All you have to do is to get the flies to the Pads.

Directions in each packet show how to do this.

Cattle Prospects for 1913.

Beef scarcity is not confined to the United States.

There is a world shortage of live stock, especially cattle. The populations of all civiliced nations are growing much faster than the general meat food supply. In England, Germany, France and all European countries, as well as the United States, meat is scarce and dear, beef has become a luxury, and the people are clamoring for legislation to give them relief.

The three great regions of live stock surplus are Austraiia, South America and the United States.

Australia is just recovering from a severe drought and her contributions must be moderate for a number of years to come.

ARGENTINE DROUGHT CRIPPLED.

Argentina's live stock interests have been crippled by three successive seasons of drought followed by "foot and mouth" disease, and having unfortunately sacrificed too many of their cows and heifers in an effort to hold the more valuable steers during the drought period, this region is now short of breeding stock. Argentina must first raise more breeding cows before she can begin to produce a normal crop of beef steers ready for slaughter. It is for this reason that they are endeavoring by legislation to prevent the slaughter of calves and of all female cattle under seven years of age. It will require from seven to ten years, at the least calculation, for her to fully recover. Besides, Argentina has strained herself to supply England's demands, and now Portugal, Spain, Italy, Switzerland and Bermuda are all drawing up on her stock.

SLAUGHTER EXCELLS INSRGASE

Owing to the increasing demands from foreign countries for Argentine beef, the annual slaughter of cattle far exceeds the increase of the herds, and legislation looking to the limiting of the number of cattle slaughtered to the number represented by the yearly increase is proposed as the sole solution. Recent advices from Argentina show greatly increased prices for young cattle, and record prices paid for breeding stock.

Brazil is not yet under headway, and cannot begin to export under a dozen years or more.

Even if the tariff on beef be removed, the United States will get no beef from South America, because the latter has not enough to supply both Europe and this country. North American cattle raisers have nothing to fear from South American competition.

CANADA IS SHORT.

Canada has none too many cattle, and with a severe climate, short season and without corn, cannot produce largely. Under normal conditions, England will outbid United States and the world for all the cattle Canada can produce. The relatively low prices there ofthe past season were due to abnormal conditions which may not occur again in twenty years.

Mexico, torn by several years of drought followed by a revolution now in progress, with her cattle industry demoralized, will take at least a decade to recover. Moreover, only common cheap cattle for grazing on what pastures are left in Oklahoma, Kansas, Colorado and one or two other states, can be expected from Mexico at best, and then not nearly so many as needed.

In the United States, according to Government figures, since 1900 the population has increased over 26 per cent, while the supply of beef cattle has declined fully 20 per cent, and during the same period the slaughter of calves has increased 600 per cent. With the decline of the ranges, cut up and partly occupies by settlements, restricted by legislation both state and national, advance of sheep raising, depleted by droughts, and closely marketed by reason of good prices; with the big cattle outfits nearly gone, and small settlers not ready to take their place in cattle growing, because they must raise quick cash crops until their lands and improvements are paid for before they can hold crops and borrow money to buy cattle with so as to raise, graze and hay-feed or feed them for market; and because corn belt farms and pastures have not yet begun to supply the deficiency, but are fact to face with the greatest scarcity of feeders ever known, nothing but a continued shortage of beef cattle may be looked for during the year 1913.

DEMAND FOR BEEF.

Ever since the close of 1907, there has been a tremendous demand for cheap beef, especially throughout the densely populated manufacturing section of the United States, lying east of Chicago, where the bulk of commercial meats are sold. To meet this demand for cheap beef, the stock of cows and heifers has been depleted all over the country, while the deficiency thus created has compelled the packers to draw heavily upon the supply of young steers that normally and properly belong in the feed lots.

This increased demand at market for light and medium steers for slaughter has tended to drain the country of such cattle until the supply has become very scarce in both range regions and corn belt. Farmers and cattle feeders have been forced to buy them at the larger markets because they could find them nowhere else. This has brought them in direct competition with the packers, and owing to the relatively higher prices bid by the packers for young steers, fewer cattle than usual have been going into the feed lots. The decrease in the feeder cattle movement from five markets during the first eleven months of this year, as compared with the corresponding period of 1911, is over 158,000 head.

Not only has the movement of cattle direct from the ranges to the feed lots ceased, but part of the feeder cattle movement shown by the above figures consists of young and female cattle bought for the purpose of restocking the ranges, and shipped from the markets to regions that have always heretofore been regarded as sources of market supply for such cattle.

HAD A TERRIBLE ATTACK OF DIARRHŒA.

Became Very Weak.

Diarrhœa, especially if allowed to run any length of time, causes great weakness, and the only thing to do is to check it on its first appearance. You will find that a few doses of Dr. Fowler's Extract of Wild Strawberry will do this quickly and effectively.

Mrs. Jacob Smith, Manor, Sask., writes:—"I am pleased to express my gratitude for your remedy. In my case, I had a terrible attack of diarrhœa. Just about every three minutes, I would have a passage, and it would keep this up for a week at a time, causing the passing of bloody water. I was so pained and weak, I could not do anything.

'Seing your Dr. Fowler's Extract of Wild Strawberry recommended, I tried it and it thoroughly cured me. It is the only medicine for this complaint I will now have.'"

"Dr. Fowler's" has been on the market for over sixty-five years, and is, without a doubt, the best remedy known for the cure of Diarrhœa, Dysentery, Colic, Cramps, Pain in the Stomach, Cholera Morbus, Cholera Infantum, and all Bowel Complaints.

When you ask for "Dr. Fowler's" see that you are not handed one of the many substitutes for this old reliable remedy.

Price, 35 cents.

SHORTAGE IN CORNBELT.

The practical point to bear in mind is that the full extent of the deficiency in the supply of young cattle for corn belt feed lots is not indicated by the decrease in the feeder as shown by official reports from the principal western markets, and that the present general scarcity of such cattle is bound to show, in due season, in a corresponding scarcity of finished cattle at market.

Another grave consideration lies in in the fact that the partial drought of 1909 and 1911 in the United States, and the general drought of 1910, which extended over all Canada, Mexico and the western two-thirds of the United States forced prematurely to market vast numbers of young and female cattle, which still further reduced the stock of breeding cows in the country. The result is a big deficit of breeding cows from which to produce calves suitable for feed lot use.

In fact, there are not enough breeding cows left in the country to keep up the supply of beef steers. More cows of suitable breeding age must first be produced, developed and added to the stock of breeding cows now on hand, which will take at least four years, while, meantime, those that wear out, die and are slaughtered must be replenished, before the nation is ready to begin breeding for an adequate supply of beef steers. To produce a crop of calves will require another year. To raise and prepare the latter for market will require at least two years more, so that under the most favorable conditions not less than about seven years will be required to restore an adequate annual production of beef cattle.

RESTOCKING IS SLOW

The present stock of breeding cows

will not be bred before next May or June, 1913.

It will require nine months gestation, so that the next stock of calves, which will average about 80 per cent, only half females, will be born in February or March, 1914.

These females must be at least two years old before they can be bred, which will be in May or June, 1916.

It will then require nine months, or until February or March, 1917, for their cattle to be born, only half of which, or a 40 per cent increase, will be bull calves from which to make steers for feeding.

Another two years will be required to raise and prepare these steer calves for market as beef steers, which will extend the time to the spring or fall of 1419, or nearly seven years hence, at the earliest, before they can be restored to the country an adequate supply of beef steers ready for slaughter.

The above is a demonstration which any practical cattle raiser will verify.

SPASMODIC BREAKS.

Meantime, it is possible that there may occur spasmodic seasons of temporary overmarketing of the meagre supply of beef cattle in the country, which may depress values for short periods, followed by seasons of severe scarcity at market and abnormally high prices.

Such a season is liable to occur within the next 60 or 90 days, but may be easily avoided if only feeders of cattle will hold them, regardless of market fluctuations, until they are mature and ready for market. The only danger lies in a premature rush of unfinished cattle on the part of those who have not sufficient confidence in the stability of market prices to hold them until maturity, thereby bringing upon themselves and others the very conditions which they fear.

For, gainsay it as they will, the natural law of supply and demand governs the market values of live stock; otherwise there would be no explaining the prices of 1912, which have been the highest ever known.

CATTLE BREEDERS OPPORTUNITY.

The summing up of the whole cattle situation is this: (1) that tnere is a wild snortage of cattle, and cheap beef is a thing of the past; (2) that the farmers and stock raisers of the United States have nothing to fear in the way of cattle or beef competition from either Mexico, Canada, or South America, during the next decade, or longer: (3) that, henceforth, the corn belt farms must be looked to more than ever before for our domestic beef supply, or else the American people must face a beef famine: (4) that to save the calves and to breed and raise more and better cattle on their farms is not only a duty which corn belt farmers owe to their country, but also a necessity for preservation of the declining fertility of their own lands; and, (5) that by buying foundation herds of good cows and pure-bred bulls, of pure-bred animals of both sexes, at the present relatively very low cost of such breeding stock, which, owing to cessation of range demand, is almost on a level with beef prices, together with economical, improved methods of beef production, involving the raising of more corn, the building of silos for both winter and summer use, and the raising of alfalfa—such a course cao be made to pay a larger annual net profit, on an average through a series of years, and confer greater and more lasting benefits upon both producer and public, than any other now presented to the corn belt farmers of the United States.—J. A. Spoor.

Fly Repellent.

Will you kindly give me a good remedy for flies as my cattle are very much annoyed by the pests, especially at milking?—H. D.

On the whole, we believe it is fully as cheap and satisfactory to purchase some of the proprietary fly repellents as it is to make the mixture on the farm. The following is a recipe which has been used with fair success: Fish oil, three quarts; petroleum, one quart; carbolic acid, one ounce.

Ground oats make splendid feed for practically all of the growing stock on the farm.

The cow with a dainty appetite, the one that is a delicate eater, is seldom the most liberal producer.

The dairy that is properly equipped will bring more profit than one not so well arranged and it will get practically everything out of the product. Less butter-fat will go to waste.

WANTED!

Thousands of Farmers throughout the country and others interested in Sheep Raising to visit the

Dominion Government Department of Agriculture Sheep Extension Car

Which is due to arrive at different points throughout the Province of New Brunswick on dates as scheduled on page 690 of this issue.

Look up the date and remember it

THE HORSE.

Corns--Bruised Soles.

This expression is applied to nearly all bruises of the rear half of the horse's hoof. There is a rupture of the blood vessels from injury (pressure from an improperly fitted shoe, or permitting the shoe to remain on for more than five weeks). Corns are apparent to the eye as yellowish, reddish, or bluish-red discoloration of the horn of the sole and white line. The horn tubes are penetrated by blood from the ruptured blood vessel. the discoloration may be so slight that if the foot be improperly pared, the corn may be entirely overlooked. We have corns of the wall, sole and bars. Corns affect principally the inner half of the hoof, and the fore feet are almost exclusively the seat. There are two reasons for this:

First—Because the fore feet support the greater part of the body weight.

Secondly—Because the heel of the fore foot is first placed upon the ground during progress, thus receiving much more concussion than the heels of the hind feet.

THR DIFFERENT KINDS OF CORNS.

1. Dry Corns. This corn is dry and seldom causes lameness.
2. Suppurating Corns. Considerable pus is formed causing severe lameness.
3. Chronic Corns. This corn is either soft, moist or lardy and there is an intermittent lameness agravated by improper shoeing.

CAUSES OF CORNS.

Some feet are predisposed to corns, viz., narrow, deformed hoofs, deformity of the limbs, badly trimmed, wide, flat feet, excessively weakening the sole bars and frog, permitting the toe to grow too long, shortening one quarter too much, so that the foot is unbalanced, shoeing a heavy horse with too light a shoe, thus permitting the shoe to spring down on the heel. Permitting the feet to become too dry and brittle, thus reducing the elastic properties of the horn. Nailing the shoe too far back, thus preventing the natural spread of the hoof when placed upon the ground. Applying the shoe too hot while being fitted. Insufficient concavity of the shoe in flat feet. Horses which have never been shod rarely have corns, thus proving that corns are due to errors in shoeing.

TREATMENT.

First removal of the cause by paring the hoof to the proper angle; shorten the toe and cut down the quarters if too high. Put on a level shoe. If calks must be used, use both toe and heel caiks, never toe without heel, nor heel calks without toe, unless for a special purpose. A leather sole should always be used under the shoe and place a dressing over the sole of the following mixture:

Pine Tar, 8 ounces
Venice Turpentine, 1 ounce
Spirits Camphor, 1 ounce
Compound Tincture Benzoin, 2 ounces

Mix and smear plentiful over the sole, after which apply oakum and the leather pad.

When there is a suppurating corn, the shoe should be left over for several days and drainage for the pus established. Poultices of flaxseed should be applied in which has been placed about two ounces of creoline. When the lameness has been removed, the horse should be carefully shod, using a bar shoe with a leather sole, and the above dressing. The after-care of the hoof consists in keeping it cool, moderately moist and pliant.—San Francisco Veterinary College.

The Wear of Horses Legs and Feet.

The fact that horses' legs and feet are so susceptible to the adverse effects of the wear and tear which work entails upon them is the bane of horse owners, and forms the principal reason why horses generally depreciate more or less rapidly in value once they begin to age, if not sooner. This is expressively summed up in the old adage that "a horse is as old as its legs." The amount of wear which a horse's limbs are capable of standing of course varies greatly in different cases, just according to whether they are possessed of inherent stoutness or the reverse, and there is no direction in which horses differ more widely than in regard to this point. For the reasons advanced one of the most crucial considerations in choosing a horse for everyday work, and especially for road work, is to look for strong and tough legs and feet.

INDICATIONS OF STRENGTH AND STOUTNESS.

It may not be possible to judge conclusively as to whether they are really strong and possess good wearing capacity or not from their shape and appearance, but one can form a pretty shrewd opinion from the various outward indications. The foremost attributes to be sought for, as denoting strength and stoutness of leg, are a short cannon and flat bone allied with tense, clean tendons, running perfectly parallel with the can-

Horsemen Attention ! !

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevents the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

After Using

Use this preparation thoroughly for alland every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR :--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

Hillsboro, N. S.

MESSRS. FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

DEAR SIR :—I have used Dr. J Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

W. A. C. RANDALL, M. D.

FRASIER THORNTON & CO., Cookshire, Que.

DEAR SIRS :—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

(Signed) G. E. CRONKHITE, (Horseman),
Hawkshaw, N. B.

non bone, while when the bone is razor-like and flat the foot may also be usually assumed to possess a satisfactory degree of toughness, provided it is of a good shape. Flat-shaped, very low-heeled feet generally do not wear well. One of the principal features that indicate want of strength or actual weakness of the forelegs is when they are what is called tied in below the knee, consisting in the tendons being compressed, as it were, just underneath the knee-joint, so that the leg is narrower at this point that further down the cannon, while the back line of the tendons converges inwards towards the knee, instead of being quite straight and running parallel with the cannon bone. Such a tied-in condition below the knee is a grievous fault, and a horse affected therewith is only too likely to sprain its back sinews on slight provocation. An important factor tending materially to enhance the wearing-resisting capacity of the legs is a well-sloped pastern, for this renders the action springy and serves to break the force of the concussion to which the feet and legs are exposed. These will feel the harmful effects of such concussion much more severely if the pasterns are very upright, because the shock, when the foot is brought to the ground, is not broken at all in this case, but gets transmitted in its full force direct up the leg through the straight and rigid column of bones. In the action of straight-pasterned horses there is none of the spring or resiliency which is usually associated with nicely sloped pasterns and this entails a considerably increased wear and tear in the limbs. For these reasons the legs of horses with upright pasterns are generally found to wear badly.

LIGHT IN BONE.

It is usually held that the fact of a horse having plenty of bone below the knee is an indication of strength of limb, and that the legs are hard wearing, but it is very much open to question whether this view is really correct. No less an authority than Mr. Walter Winans has recently expressed his conviction in print that there is little in this theory, his belief, as the outcome of long and great practical experience, being that the legs of light-boned horses wear quite as well, other things being equal, as those of horses with much bone beneath the knee. A substantial proof in support of this contention is afforded by horses and ponies of Arab breed, which are noted for the great toughness and wear-resisting capacity of their limbs, yet which generally are on the light boned side, if not actually considerably deficient in bone. However, deep-rooted beliefs that have the weight of long-established tradition and well-nigh universal acceptance behind them are not easily shaken or discarded.

TOP-HEAVINESS.

Probably nothing speaks more badly for the wearing capacity of a horse's limbs than the fact of the animal being too heavily topped. The legs and feet of horses showing this most undesirable kind of conformation usually become the worse for wear at a comparatively early age, and are exceedingly liable to develop unsoundness, especially if they are subject to much stress and wear, simply because of the fact that they have to support a disproportionately heavy body. This imposes an added strain on them, and intensifies the evell effects accruing from concussion, so entailing an abnormally high degree of wear on them.

ATTEND TO THE SHOEING.

There is, as a rule, not much that can be done to counteract the results of the wear and tear to which the limbs of horses are exposed in the ordinary course of things. Something in this direction may, however, be done by careful shoeing, and in particular by encouraging the frog to expand as much as possible and allowing it to take a good bearing on the ground. A well-developed, prominent frog undoubtedly aids not inconsiderably in conserving the feet and legs, because it will act as an elastic cushion or buffer, which minimises and breaks the force of concussion, thus saving the limbs. The use of calkins and thick-heeled shoes is usually best avoided, for these tend to increase the wear and tear imposed on the foot and leg, because they throw the limb out of its true balance. In towns india-rubber and leather pads, inserted between the foot and shoe, are very often resorted to with the object of saving the legs from concussion (as well as to prevent slipping), and it is probable that this expedient is of some value in this direction, though the benefit derived may not be so great as it is thought to be by some. The most effectual way of preventing undue wear of the legs consists in avoiding fast work on hard roads, but this is, of course, a counsel of perfection which can only be followed, to a greater or less extent, in the case of horses used under the saddle. These should always be kept to soft going as far as possible. —Argus.

Try the 40c. package of Red Rose Tea.
Although the 30c. and 35c. qualities are generously good, people who use the 40c. quality believe it to be worth the extra money. It's a stronger, finer-flavored tea. It goes farther in the pot.
N.B.—Coffee users will find Red Rose Coffee as generously good as Red Rose Tea
375

Grease in Horses.

I bought a mare a few days ago, and find she has a little grease on one hind leg. What is the treatment for grease, and what causes grease?—E. M.

Taking your last question first; the exact causes of grease are clipping the heels, washing them and leaving them wet, exposure to dirt, neglect of grooming, and feeding moist or inferior food. As to the cure, in mild cases a useful lotion of ½ oz. each of sulphate of zinc and acetate of lead in 1½ pints of water, or 1 oz. of powdered alum and ½ oz. of pure carbolic acid in 1½ pints of water.

Worms or Bots in Horses.

Would "Vet." let me know what to give a four-year-old cob troubled with worms, or, I might say bots?

Bots leave the stomach of the horse naturally when mature. If animals is low in condition support with good food and give every morning a bran mash containing a handful of common salt, or try the following: — A dessertspoonful flowers of sulphur, a dessertspoonful common salt every night in food.—Vet. Surgeon.

POULTRY.

How Many Eggs can a hen lay?

The egg as it appears on the table—the finished product is the result of a long and complicated series of physiological processes, claims Raymond Pearl, Ph. D., biologist of the Maine Agricultural Experiment Station, who has a wide experience in poultry-keeping.

It begins as a microscopic cell in the body of the embryo chick many days before hatching. Indeed, at the time when the poultryman makes the first test of the eggs in his incubator, all the eggs which will be laid by the pullet that will hatch from one of the fertile eggs which passes through his hands are already present in the embryo chick as definite and distinct bodies. As development proceeds, these embryonic eggs, or oocytes, are collected together in a definite organ of the body, the ovary or "egg-cluster." During the growth of the chick these oocytes develop. They increase in size, chiefly by the deposition of yolk within them. The surface of the ovary becomes studded with little spheres, first very small, but all the time growing. When the pullet reaches the age of about six months, if all has gone well with it physiologically, certain ones of the oocytes begin a very rapid growth—much more rapid than that which had preceded. A relatively thick layer of yolk is added each day, and presently an egg is laid.

When the oocyte has attained that respectability of size which entitles it to be called in common parlance a "yolk," the thin membranous funnel end of the oviduct, or "egg tube," slowly and carefully wraps around it, and encloses it within the cavity of the tube. Shortly the sac of membrane which has held the developing yolk ruptures along a definite line, and the completed yolk escapes from the bonds which have held it during the long months of its growth, and drops free into the egg-tube, which has been wrapped around to receive it.

The freed yolk now passes slowly down the egg-tube, and receives on its way its protecting layers of "white," or albumen, the shell membrane and the shell itself. At the end of the process, the finished product, an egg, as we know it in every-day life, passes outside of the body of the hen, to begin its checkered course to the breakfast table of the consumer.

Now, from the standpoint of the poultryman the most interesting point in this long chain of events is that at which the yolk or developed oocyte, is separated from the ovary. The frequency with which this event of separation (or, as it is technically called, ovulation) occurs within the lifetime of the bird measures its relative success as a market-egg producer. It is a matter of common observation that when the physiological machine which we call a hen is working at its topmost rate of speed only one egg per day is produced. Of course, a hen will occasionally lay two eggs in one day, but this is a rare occurrence, and only means that the timing of the machine was not perfectly regulated. The important and really distressing thing is that generally speaking, hens do not continue for any considerable period to lay even one egg apiece per day.

Why is this? What determines, biologically speaking, how many eggs a hen shall lay? Is the output anatomically restricted, or physiologically? Or, put it another way; does the hen that lays 125 eggs in the year do so because she has only about 125 eggs in her ovary, while the 200-egg hen has twice as many? Or, are both these birds equally endowed in respect to the number of eggs they carry in their bodies but different in their capability of fetching them forth into the world of breakfast-tables and egg buyers?

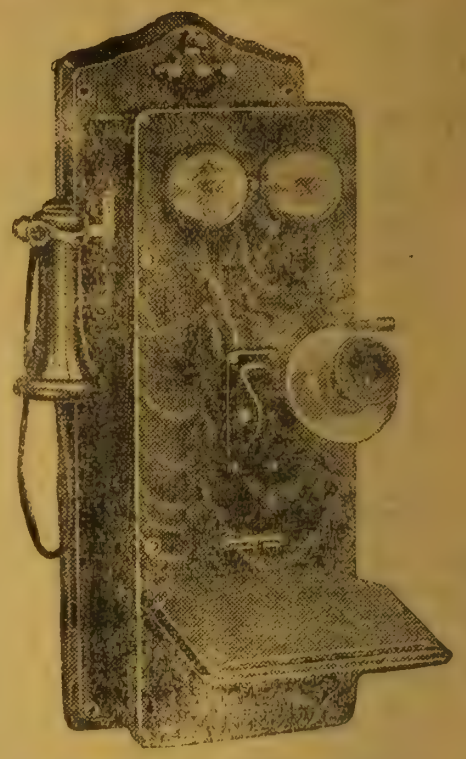
These are problems which the writer has been for some time studying, and the facts in the case appear to be somewhat as follows; all hens, the poorest as well as the best of layers, have an original endowment of eggs, very far in excess of any number which they actually lay. Roughly speaking, it may fairly be said that if actual egg production be measured in hundreds, egg endowment (that is the number of ooctyles in the ovary) is measured in thousands. Furthermore, the number of eggs actually laid bears no relation whatever to the number of oocytes present in the ovary and potentially capable of being laid.

In the writer's laboratory a number of counts have been made of the number of oocytes on the ovaries of laying hens. Only those oocytes which were large enough to be seen by the unaided eye could be thus counted, and it is certain that in every case there are many more, probably several times as many more, miscropic oocytes embedded in the ovarian tissue which are uncounted. But taking only those which are visible to the unaided eye, the results are sufficiently striking. A few examples may be cited. Thus a White Leghorn hen which had laid 198 eggs in its pullet year was killed at the end of that year, and an ovarian count revealed that there were then remaining on its ovary 2,452 oocytes large enough to be seen by the naked eye! Each one of these was potentially capable of becoming a perfect egg. Another White Leghorn hen of the same age as the first laid during its pullet year exactly 2 eggs. Its ovary, when subjected to the counting process, showed the presence of 2,145 oocytes visible to the unaided eye. This extremely poor layer possessed substantially the same anatomical endowment in respect to eggs as the first, yet what a difference there was in the actial laying! No more convincing evidence could be found that the number of eggs present in the ovary is no criterion as to the number which will actually be laid by a bird. Even the humble guinea-fowl, a bird not noted for egg-producing qualities, may have as many as 765 visible oocytes on its ovary.

Taking all the results of these counting studies together, it appears that the difference which the poultryman observes in respect to egg production amongst the members of his flock do not depend at all upon difference in original endowment of the birds in regard to eggs potentially capable of being laid. Every bird has a vast lot of eggs in reserve than it ever actually lays. It is in ability to ovulate—that is, to discharge oocytes from the ovary—that hens differ.

Does the number of eggs in the ovary change during the life of the individual? Can the number be increased in any way? From what has preceded, it is clear that this is not a question of any practical significance to the poultryman, since in any case the number present is so vastly greater than what any hen ever lays. It is an exceedingly difficult biological problem to determine whether new oocytes are ever formed after a bird is hatched. The weight of evidence, however, indicates that there is no increase; that on the contrary the chick is hatched with all the eggs in its body that it will ever have. But this number is so greatly in excess of both its needs and its physiological

Put The Latest Style Telephones On Your Lines



INCREASE the efficiency of your Telephone system by installing the latest style Telephones. Canadian Independent Telephones are the highest-grade made. We guarantee them to be superior in style, workmanship, and material to any others on the market. You can prove this true by trying them out on your own lines, side by side with other phones. This you can do without risking a cent. Just ask us about our Free Trial Offer.

Get Our Advice If your locality does not enjoy social and business advantages afforded by an up-to-date telephone service it is time you got into communication with us. We are the largest independent Telephone Manufacturers in Canada, and have been instrumental in seeing that the majority of the independent local and municipal companies have started into telephone business along lines that ensure success. We can help you get a telephone line for your locality. Write us and we will tell you how.

ability to utilize that this restriction causes no hardship.

Growing Exhibition Birds.

How can I treat my growing stock so that I shall secure the greatest possible number of exhibition specimens? Questions like this I am constantly receiving. Probably every ten years of my life as a poultryman I have answered this and similar questions in one issue of a poultry paper, but the demand for this information does not cease. Two generations have passed away since first I answered such a request for information. However, the young breeders are always with us and we veterans make the mistake of thinking that everyone must know the things that seem to us so commonplace, because we learned them by experience long ago.

Four Big Grabs with this Louden

Hay Fork and your biggest load is in the mow. This is one of the many "Louden" ways to EASIER and more profitable farming. When you use Louden Hay Tools you save time and labor and thus get more value from your hay. The

LOUDEN Balance Grapple Fork

picks up long or short hay, alfalfa, clover or threshed straw, just as clean and quickly as it does timothy. Light, but firm and strong. Handles a third of a ton at a time and is tested to carry half a ton without strain. Use this Fork with the Louden Junior Carrier and haying becomes more profitable.

To fit birds for the exhibition is an entire season's work. It is legitimate to remove all defective feathers that nature may help you by a renewal of color true to the breed. For instance, stray black feathers may appear in a white specimen or appear in the white or parti-colored breeds, like Brahmas and Columbian Wyandottes. If these foul feathers are removed, nature often, in fact in a majority of cases, produces a feather that is true to the color of the bird.

Young cockerels often have their plumage marred by the cruelty of a domineering cock. Feathers thus damaged grow narrow and pointed beyond the balance of the wing. Perhaps the sickle feathers are injured and these defective feathers if removed will be replaced with good feathers of proper color. White sometimes appears in a black tail or wing when the bird is in full molt. Remove the white feather and in six weeks there will be a nice black feather in its place. If a specimen otherwise is perfect enough to insure its winning, you should not hesitate to help the specimen by the removal of these objectionable feathers and give it time to recupetate.

From the first of September to the show season, every day makes its demands upon the wide-awake breeder if he is to win. There were at least one thousand exhibitions of poultry in the States during 1911. It is a low estimate to say there were thirty exhibitors at a show, which means about 30,000 men were fitting birds for these exhibitions, so you see, breeder, you are up against great competition and it behooves you to do the most you can for your birds to bring them to the highest state of perfection if you are to win.

The only way we can keep our stock in a presentable condition is to remove all defects, all excrescences and to remove all broken plumage, otherwise the fowl must wear his damaged feathers until nature replaces them in the fall. A Light Brahma pullet may have a few black feathers that should be white, or white ones that should be black, but if removed two months before exhibition they will come in the proper color, the white ones will be white on the surface with an undercolor of white, bluish-white or slate-gray and will be uncut for color. If you do not attend to these things, the bird will stay at home as a disqualified specimen.

The first thing that nature does in case of a wound is to try to repair it. In single combs or pea combs sometimes the middle division grows too fast for the side divisions. If discovered in an early stage and the point is lanced with a sharp lance, the growth will be checked until the side divisions develop in keeping with the middle division. Sometimes single combs develop into a twist. I saw a magnificent Partridge Cochin pullet in a friend's yard. He remarked that it was a uity she was disqualified. He was called away and I picked her up and lanced the comb from the rear close to the head, let out the oil and blood with a thread of silk tied the comb back straight and then swore the helper to secrecy. Two weeks later I took out the stitches and when I called my friend's attention to it he could not believe it until I showed him the lance wound, the scab of which had not come off. Such helps are beneficial and they are legitimate.

I had a Barred Plymouth Rock cockerel whose ear-lobes were half white. I gave him chloroform and skinned the lobes. He never begot a chick with white ear-lobes. This led me to believe that many defects are not transmissible and if these things are not hereditary it is permissible to remove them.—I. K. Felch, Natick, Mass. in Reliable Poultry Journal.

Dry or Moistened Food.

About eighteen months ago, the Eew York Experiment Station conducted experiments during the period of a year in which it demonstrated that a flock of hens will cost less when fed on moistened food than when given food that is entirely dry. Also that eggs can be produced at a greater profit on moistened food than on dry. It was demonstrated, however, that a flock of fowls that was allowed exercise gave better results than one that was wholly confined. The two breeds used were Leghorns and Cochins, and the smaller breed (Leghorns) produced eggs at less cost than did the larger breeds; but considering the cost of raising, and the ultimate poultry value of the hens, the profits are more favorable for the larger hens. The Leghorns ate about two and one-fourth ounces of food (water free) per day for each hen, and the Cochins three and one-fourth ounces. The cost of the food for the whole year varied from seventy-two cents to one dollar, and the market value of the eggs varied from eighty-four cents to one dollar and twenty-four cents. Of course, where the hens were confined the cost of production would naturally be more than if they were on a range, and the production of eggs would also be smaller, but the experiment is a valuable one, however, and gives considerable light on feeding poultry.

Milk for Poultry.

When given with care, one of the best foods for young and growing chicks, and the laying hens too, is sweet milk. Of course, milk alone cannot take the place of other foods, as it is not sufficiently concentrated, being about 85 per cent water, thus making it impossible for a growing chick to drink enough for its support. But if milk is used for moistening the ground grain for chicks, it will assist in providing a complete ration. Milk should also be allowed for drinking purposes, both for the young birds and the old ones, but must be given in clean vessels that will prevent filth from getting into Filthy milk will usually induce bowel disease among the young chicks. If one of two old fowls are diseased they should not be allowed access to the vessel containing milk that is fed by the healthy fowls, for in this was the disease will be quickly spread—even more quickly than through drinking water. The young chicks should have fresh milk only, as sour milk is suitable only for the adults, being injurious to all kinds of young animals. Sour milk may, however, be given to the young chicks in the form of cottage cheese, if allowed in limited quantities. In whatever form the milk is given, the supply must be renewed daily, and all vessels kept thoroughly clean.

Every farmer should allow the poultry a share of milk, instead of feeding all to swine. It has been proven that when milk is added to the grain ration, young chicks gain nearly twice as fast in weight as when grain alone is used, and as skimmilk and buttermilk contain nearly all the elements of food, eggs are more easily produced by hens fed upon such than when they are not so provided.—W. F. Purdue.

Green Food for Poultry.

When fowls have free range, they eat a considerable amount of grass and other green foods. It would appear, therefore, to be desirable that where birds are confined either in small runs during the summer, or in houses when the ground is covered with snow in winter, that some effort should be made to supply this food.

Many foods are available, such as waste cabbage, mangels, turnips, rape clover hay, or clover leaves and green food grown especially for the purpose.

Early in the fall we use cabbage or rape; or at times where the runs have been sown to fall rye or wheat, the fowls are allowed to feed upon these. Where rape is extensively fed it frequently will cause the whites of the eggs to have a greenish cast, which renders them unmarketable. This food is relished by the fowls, but must be fed carefully. Cabbage at times will flavor the eggs slightly, and if frozen may cause serious digestive troubles. Both rape and cabbage make good green foods, but good judgment must be exercised in their use.

Mangels are a very succulent food and are relished by the birds during the winter. They can be fed either pulped or whole. When they are fed whole, we usually stick them on a projecting nail, at a convenient height upon the wall of the pen. When these are fed freely they frequently scour the fowls. For this reason during some seasons we are obliged to feed them not more than twice a week.

Turnips may flavor the eggs. They are not as palatable as mangels, in fact some birds will not eat them at all, but at the same time they have considerable food value.

Clover leaves, either steamed or dry, are relished very much, and upon the whole are the most reliable green food. One hundred hens will eat from a peck to a bushel of clover leaves daily. This food upon the farms is cheap and easily procured, and should be fed more than it is.

Oyster Shell for Furnishing Lime.

Some years ago a then well-known writer condemned the use of oyster shell as a food for furnishing lime so necessary in the construction of the egg shell. His contention was that the oyster shell did not contribute lime sufficient for that purpose. However, the New York Agricultural Experiment Station vetoed that by proving that a pound of oyster shell contains sufficient lime to manufacture about seven dozens of eggs. The proper way to feed oyster shell is to have a small box of it within reach so the fowls may help themselves at will. Mixing it in the morning mash is risky, as there is a likelihood that the hens will consume more than required, and in consequence the shells of the eggs would become too hard. The hens know best when their system demands more lime. It is a very rare case when a hen gets too much if constantly within reach.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

(Continued from last issue.)

"But I wouldn't so much as give it another thought," said Peggotty, cheerily, "if my Davy was anyway against it—not if I had been asked in church thirty-three times over, and was wearing out the ring in my pocket."

"Look at me, Peggotty," I replied; "and see if I am not really glad, and don't truly wish it!" As indeed I did, with all my heart.

"Well, my life," said Peggotty, giving me a squeeze, "I have thought of it night and day, every way I can, and I hope the right way; but I'll think af it again, and speak to my brother about it, and in the meantime we'll keep it to ourselves, Davy, you and me. Barkis is a good plain creetur'," said Peggotty, "and if I tried to do my duty by him, I think it would be my fault if I wasn't—if I wasn't pretty comfortable," said Peggotty, laughing heartily.

This quotation from Mr. Barkis was so appropriate, and tickled us both so much, that we laughed again and again, and were quite in a pleasant humor when we came within view of Peggotty's cottage.

It looked just the same, except that it may, perhaps, have shrunken a little in my eyes; and Mrs. Gummidge was waiting at the door as if she had stood there ever since. All within was the same, down to the seaweed in the blue mug in my bedroom. I went into the outhouse to look about me; and the very same lobsters, crabs, and crawfish possessed of the general, appeared to be in the same same desire to pinch the world in state of conglomeration in the same old corner.

But there was no little Em'ly to be seen, so I asked Mr. Peggotty where she was.

"She's at school, sir," said Mr. Peggotty, wiping the heat consequent on the porterage of Peggotty's box from his forehead; "she'll be home," looking at the Dutch clock, "in from twenty minutes to half-an-hour's time We all of us feel the loss of her, bless ye!"

Mrs. Gummidge moaned.

"Cheer up, Mawther!" cried Mr. Peggotty.

"I feel it more than anybody else," said Mrs. Gummidge: "I'm a lone lorn creetur', and she used to be almost the only thing that didn't go contrairy with me."

Mrs. Gummidge, whimpering and shaking her head, applied herself to blowing the fire. Mr. Peggotty, looking around upon us while she was so engaged, said in a low voice, which he shaded with his hand: ;"The old un!" From this I rightly conjectured that no improvement had taken place since my last visit in the state of Mrs. Gummidge's spirits.

No, the whole place was, or it should have been, quite as delightful a place as ever: and yet it did not impress me in the same way. Ifelt rather disappointed with it. Perhaps it was because little Em'ly was not at home. I knew the way by which she would come, and presently found myself strolling along the path to meet her.

A figure appeared in the distance before long, and I soon knew it to be Em'ly, who was a little creature still in stature, though she was grown But when she drew nearer, and I saw her blue eyes looking bluer, and her dimpled face looking brighter, and her whole self prettier and gayer, a curious feeling came over me that made me ptetend not to know her, and pass by as if I were looking at something a long way off. I have done such a thing in later life, or I am mistaken.

Little Em'ly didn't care a bit. She saw me well enough; but instead of turning round and calling after me, ran away laughing. This obliged me to run after her, and she ran so fast that we were very near the cottage before I caught her.

"Oh, it's you, is it?" said little Em'ly.

"Why, you knew who it was, Em'ly," said I.

"And didn't you know who it was?" said Em'ly. I was going to kiss her, but she covered her cherry lips with her hands, and said she wasn't a baby now, and ran away, laughing more than ever, into the house.

She seemed to delight in teasing me, which was a change in her I wondered at very much. The tea-table was ready, and our little locker was put out in its old place, but instead of coming to sit by me, she went and bestowed her company upon that grumbling Mrs. Gummidge: and on Mr. Peggotty's inquiring why, rumpled her hair all over her face to hide it, and would do nothing but laugh.

"A little puss it is!" said Mr. Peggotty, patting her with his great hand.

"So sh' is! so sh' is!" cried Ham. "Mas'r Davy bor, so sh' is!" and he sat and chuckled at her for some time, in a state of mingled admiration and delight, that made his face a burning red.

Little Em'ly was spoiled by them all, in fact; and by no one more than Mr. Peggotty himself, whom she could have coaxed into anything by only going and laying her cheek against his rough whisker. That was my opinion, at least, when I saw her do it: and I held Mr. Peggotty to be thoroughly in the right. But she was so affectionate and sweet-natured, and had such a pleasant manner of being both sly and shy at once, that she captivated me more than ever.

She was tender-hearted too; for when, as we sat around the fire after tea, an allusion was made by Mr. Peggotty over his pipe to the loss I had sustained, the tears stood in her eyes, and she looked at me so kindly across the table, that I felt quite thankful to her.

"Ah!" said Mr. Peggotty taking up her curls, and running them over his hand like water, "here's another orphan, you see, sir. And here," said Mr. Peggotty' giving Ham a backhanded knock in the chest, "is another of 'm, though he don't look much like it."

"If I had you for my guardian, Mr. Peggotty," said I, shaking my head, "I don't think I should feel much like it."

"Well said, Mas'r Davy, bor!" cried Ham in an ecstasy. "Hoorah? Well said! Nor more you wouldn't! Hor! Hor!"—Here he returned Mr. Peggotty's back-hander, and little Em'ly got up and kissed Mr. Peggotty.

"And how's your friend, sir?" said Mr. Peggotty to me.

"Steerforth?" said I.

"That's the name!" cried Mr. Peggotty, turning to Ham. "I knowed it was something in our way."

"You said it was Rudderford," observed Ham, laughing.

"Well retorted Mr. Peggotty. "And ye steer with a rudder, don't ye? It ain't fur off. How is he, sir?"

"He was very well indeed when I came away, Mr. Peggotty."

"There's a friend!" said Mr. Peggotty, stretching out his pipe. There's a friend, if you talk of friends! Why, Lord love my heart alive, if it ain't a treat to look at him!"

"He is very handsome, is he not?" said I, my heart warming with this praise

"Handsome!" cried Mr. Peggotty. "He stands up to you like—like a—why I don't know what he don't stand up to you like. He's so bold!"

"Yes! That's just his character," said I. "He's as brave as a lion, and you can't think how frank he is, Mr. Peggotty."

"And I do suppose, now," said Mr. Peggotty, looking at me through the smoke of his pipe, that in the way of book-lqrning he'd take the wind out of a'most anything."

"Yes," said I, delighted; "he knows everything. He is astonishingly clever."

"There's a friend," murmured Mr. Peggotty, with a grave toss of his head.

"Nothing seems to cost him any trouble," said I. "He knows a task if he only looks at it. He is the best cricketer you ever saw. He will give you almost as many men as you like at draughts, and beat you easily."

Mr. Peggotty gave his head another toss, as much as to say; "Of course he will."

"He is such a speaker," I pursued, "that he can win anybody over; and I don't know what you'd say if you were to hear him sing, Mr. Peggotty."

Mr. Peggotty gave his head another toss, as much as to say: "I have no doubt of it."

"Then he's such a generous, fine, noble fellow," said I, quite carried away by my favorite theme, "that it's hardly possible to give him as he deserves. I am sure I can never feel thankful enough for the generosity with which he has protected me, so much younger and lower in the school than himself."

I was running on, very fast indeed, when my eyes rested on little Em'ly's face, which was bent forward over the table, listening with the deepest attention, her breath held, her blue eyes sparkling like jewels, and the colour mantling in her cheeks. She looked so extraordinarily earnest and pretty, that I stopped in a sort of wonder; and they all observed her at the same time, for as I stopped, they laughed and looked at her.

"Em'ly is like me," said Peggotty, "and would like to see him."

"Em'ly was confused by our all observing her, and hung down her head, and her face was covered with blushes. Glancing up presently through her stray curls, and seeing that we were all looking at her still (I am sure I, for one, could have looked at her for hours), she ran away, and kept away until it was nearly bedtime.

I lay down in the little old bed in the stern of the boat, and the wind came moaning on across the flat as it had done before. But I could not help fancying now, that it moaned of those who were gone; and instead of thinking that the sea might rise in the night and float the boat away, I thought of the sea that had risen, since I last heard those sounds, and drowned my happy home. I recollect, as the wind and water began to sound fainter in my ears, putting a short clause into my prayers, petitioning that I might grow up to marry little Em'ly, and so dropping lovingly asleep.

The days passed pretty much as they had passed before, except—it was a great exception—that little Em'ly and I seldom wandered on the beach now. She had tasks to learn, and needlework to do; and was absent during a great part of each day. But I felt that we should not have had these old wanderings, even if it had been otherwise. Wild and full of childish whims as Em'ly was, she was more of a little woman than I had supposed. She seemed to have got a distance away from me, in a little more than a year. She liked me, but she laughed at me, and tormented me; and when I went to meet her, stole home another way, and was laughing at the door when I came

A Windsor Lady's Appeal

To all women' I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Uterine and Ovarian Tumors or growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write teday. Address Mrs. M. Summers, Box H. 309 Windsor, Ont.

DOCTORS ADVISE OPERATIONS

Saved by Lydia E. Pinkham's Vegetable Compound.

Swarthmore, Penn. — "For fifteen years I suffered untold agony, and for one period of nearly two years I had hemorrhages and the doctors told me I would have to undergo an operation, but I began taking Lydia E. Pinkham's Vegetable Compound and am in good health now. I am all over the Change of Life and cannot praise your Vegetable Compound too highly. Everywoman should take it at that time. I recommend it to both old and young for female troubles."—Mrs. EMILY SUMMERSGILL, Swarthmore, Pa.

Canadian Woman's Experience:

Fort William , Ont.—"I feel as if I could not tell others enough about the good Lydia E. Pinkham's Vegetable Compound has done for me. I was weak and tired and I could not rest nights. A friend recommended your Compound and I soon gained health and strength and could not wish to sleep better. I know other women who have taken it for the same purpose and they join me in praising it."—Mrs. WM. A. BUFFY, 631 South Vickar Street, Fort Williams, Ontario.

Since we guarantee that all testimonials which we publish are genuine, is it not fair to suppose that if Lydia E. Pinkham's Vegetable Compound has the virtue to help these women it will help any other woman who is suffering in a like manner?

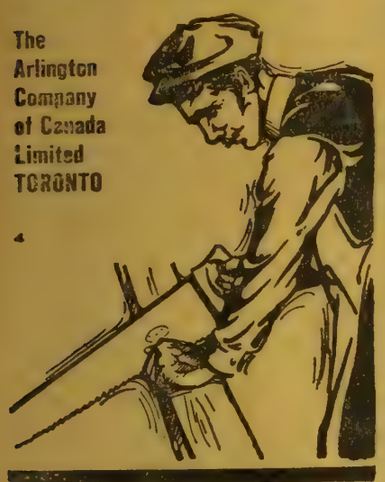
If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

CHALLENGE COLLARS

"FOR THE MAN WHO WORKS"

Hard work is no excuse for an untidy appearance. A Challenge Waterproof Collar with its dull linen-like finish will keep you neat and well-dressed. Sold at all Gents' Furnishing and Dry Goods Shops, or send 25c. for sample collar.

The Arlington Company of Canada Limited TORONTO



Gates' Life of Man BITTERS

is made of the fresh Roots, Herbs Buds, Barks and Plants.

THE PEOPLE'S' MEDICINE

Expressly to cure disease, and in chronic cases the INVIGORATING SYRUP is used in connection to regulate the bowels. Everyone should take a few bottles

Summer Excursion Fares via the I.C.R.

Facts and figures regarding summer vacation tours are always interesting to those who are on travel bent; and these are to be found in the booklet "Summer Excursion Fares" just issued by the Intercolonial Railway. The details of special round trips through Quebec and the Maritime Provinces are given, routes are defined and rates quoted in a systematic and comprehensive manner. The booklet will be mailed free to those who write the General Passenger Dept., Moncton, N. B.

Electric Restorer for Men

Phosphonol restores every nerve in the body to its proper tension; restores vim and vitality. Premature decay and all sexual weakness averted at once. **Phosphonol** will make you a new man. Price $3 a box, or two for $5. Mailed to any address. **The Scobell Drug Co., St. Catharines, Ont.**

There is no real need of anyone being troubled with constipation. Tablets will cause an agreeable movement of the bowels without any unpleasant effect. Give them a trial. For sale by all dealers.

back, disappointed. The best times were when she sat quietly at work in the doorway, and I sat on the wooden steps at her feet, reading to her. It seems to me at this hour, that I have never seen such sunlight as on those bright April afternoons; that I have never seen such a sunny little figure as I used to see, sitting in the doorway of the old boat; that I have never seen such sky, such water, such glorified ships sailing away into golden air.

On the very first evening after our arrival, Mr. Barkis appeared in an exceedingly vacant and awkward condition, and with a bundle of oranges tied up in a handkerchief. As he made no allusion of any kind to this property, he was supposed to have left it behind him by accident when he went away; until Ham, running after him to restore it, came back with the information that it was intended for Peggotty. After that occasion he appeared every evening at exactly the same hour, and always with a little bundle, to which he never alluded, and which he regularly put behind the door and left there. These offerings of affection were of a most varied and eccentric description. Among them I remember a double set of pigs' trotters, a huge pin-cushion, half a bushel or so of apples, a pair of jet earrings, some Spanish onions, a box of dominoes, a canary bird and cage and a leg of pickled pork.

Mr. Barkis's wooing, as I remember it, was altogether of a peculiar kind. He very seldom said anything; but would sit by the fire in much the same attitude as he sat in his cart, and stare heavily at Peggotty, who was opposite. One night, being, as I supposed, inspired by love, he made a dart at the bit of wax candle she kept for her thread, and put ei in his waist-coat pocket and carried it off. After that, his great delight was to produce it when it was wanted, sticking to the lining of his pocket, in a partially melted state, and pocket it again when it was done with. He seemed to enjoy himself very much, and not to feel at all called upon to talk. Even when he took Peggotty out for a walk on the flats, he had no uneasiness on that head, I believe; contenting himself with now and then asking her if she was pretty comfortable; and I remember that sometimes, after he was gone, Peggotty would throw her apron over her face, and laugh for half-an-hour. Indeed, we were all more or less amused, except that miserable Mrs. Gummidge, whose courtship would appear to have been of an exactly parallel nature, she was so continually reminded by these transactions of the old one.

At length, when the term of my visit was nearly expired, it was given out that Peggotty and Mr. Barkis were going to make a day's holiday together, and that little Em'ly and I were to accompany them. I had a broken sleep the night before, in anticipation of the pleasure of a whole day with Em'ly. We were all astir betimes in the morning; and while we were yet at breakfast, Mr. Barkis appeared in the distance, driving a chaise-cart towards the object of his affections.

Peggotty was dressed as usual, in her neat and quiet mourning; but Mr. Barkis bloomed in a new blue coat, of which the tailor had given him such good measure, that the cuffs would have rendered gloves unnecessary in the coldest weather, while the collar was so high that it pushed his hair up on end on the top of his head. His bright buttons, too, were of the largest size. Rendered complete by drab pantaloons and a buff waistcoat, I thought Mr. Barkis a phenomenon of respectability.

When we were all in a bustle outside the door, I found that Mr. Peggotty was prepared with an old shoe, which was to be thrown after us for luck, and which he offered to Mrs. Gummidge for that purpose.

"No. It had better be done by somebody else, Dan'l," said Mrs. Gummidge. "I'm a lone lorn creatur' myself, and everythink that reminds me of creeturs that ain't lone and lorn, goes contrairy with me."

"Come, old gal!" cried Mr. Peggotty. "Take and heave it."

"If I feld less, I could do more. You don't feel like me, Dan'l; things don't go contrairy with you, nor you with them; you had better do it yourself."

But here Peggotty, who had been going about from one to the other in a hurried way, kissing everybody, called out from the cart, in which we were all by this time (Em'ly and I on two little chairs, side by side), that Mrs. Gummidge must do it. So Mrs. Gummidge did it; and, I am sorry to relate, cast a damp upon the festive character of our departure, by immediately bursting into tears, and sinking subdued into the arms of Ham, with the declaration that she knowed she was a burden, and had better be carried to the House at once. Which I really thought was a sensible idea, that Ham might have acted on.

Away we went, however, on our holiday excursion; and the first thing we did was to stop at a church, where Mr. Barkis tied the horse to some rails, and went in with Peggotty, leaving little Em'ly and me alone in the chaise. I took the occasion to put my arm around Em'ly's waist, and propose that as I was going away so very soon now, we should determine to be very affectionate to one another, and very happy all day. Little Em'ly consenting, and allowing me to kiss her, I became desperate; informing her, I recollect, that I never could love another, and that I was prepared to shed the blood of anybody who should aspire to her affections.

How merry little Em'ly made herself about it! With what a demure assumption of being immensely older and wiser than I, the fairy little woman said I was a silly boy;" and then laughed so charmingly that I forgot the pain of being called by that disparaging name, in the pleasure of looking at her.

Mr. Barkis and Peggotty were a great while in the church, but came out at last and then we drove away into the country. As we were going along, Mr. Barkis turned to me and said, with a wink—by-the-bye, I should hardly have thought before, that he could wink:

"What name was it as I wrote up in the cart?"

"Clara Peggotty," I answered.

"What name would it be as I should write up now, if there was a tilt here?"

"Clara Peggotty, again?" I suggested.

"Clara Peggotty Barkis!" he returned, and burst into a roar of laughter that shook the chaise.

In a word, they were married, and had gone into the church for no other purpose. Peggotty was resolved that it should be quietly done; and the clerk had given her away, and there had been no witnesses of the ceremony. She was a little confused when Mr. Barkis made this abrupt announcement of their union, and could not hug me enough in token of her unimpaired affection; but she soon became herself again, and said she was very glad it was over.

FOUNDRY CO. SACKVILLE, N.B.

Feeding Infants.

Many precious little lives are sacrificed because mothers do not understand infant feeding, or are too careless or overburdened with work to give it proper consideration. Why is it that the second summer is the child's most critical one? First, the little one is robbed of its accustomed diet, and it is too often experimented with until other foods are found which will agree with it. I have often wondered if it would not be just as well for a mother to nurse her baby through this period as to bear the suspense, and make the baby bear the effect of her experiments at this time. Of course we know what a strain that means to a mother's constitution (it is one either way) but the question is, is she strong enough?

It should be said here that too many mothers, especially farmers' wives, are overburdened with household duties and need assistance all the time the first two years of baby's existence. Their constitutions are not only greatly weakened from the strain through which they have passed, but there is an added strain until baby is weaned and a correct diet found. The second summer is the worst part of the dentition period, and as a babe's system is in a most irritible condition at teething time, and indigestible food will easily upset it. Did you ever

think of baby's toothaches as being as serious as your own? Do you deny it cold water to cool its feverish gums? With the second summer comes the difficulty of cutting the larger teeth. However, I think we are apt to lay too many ill to teething when in fact they are due to improper diet. For instance, notice the treatment that the physician gives his tiny patient. All the indigestible and poisonous material it has eaten is physicked out of its system the first thing, and a very simple diet advised.

Indigestion is the principle ailment that mother and babes have to battle with, outside of the contagious diseases, and the one the careless mother needs to be warned against. Should she get him through a first attack, she should vow never to allow a second one, for indigestion paves the way for serious diseases and convulsions sometimes result. Often an apparently healthy child is snatched from life suddenly by a frightful convulsion. All mothers should not only know what to do in such a circumstance but they would do much better to know how to prevent such a calamity.

The child begins to walk the second summer, and often helps itself to indigestible food in spite of all your careful attention. I think mothers do wrong in giving the pretty ripe fruit to children as playthings, especially after the baby begins to get teeth. And it also seems to me inadvisable to have fruit planted in the yard where babies or children must get out in the sun and fresh air to exercise. This fruit is very apt to produce troible. The busy mother who does her own work can not keep her mind continually on her little ones, if she is a farmer's wife and has a big family and hired hands to make so much work, but she should aim to keep mischief for the little stomachs out of their reach. This means that they must be near her a great deal of the time. A childless lady once said to a busy mother, "I don't see how you do anything with the children hanging around you all the time." The astonished mother replied, "Why, they are what I do!"

When I see a mother whom some people call "fussy over her children," I think of this, and that she is only doing her duty. There is nothing so important as our children, and no part of their care more important than the diet.

Washing Blankets, Quilts and Comforters.

To wash blankets, quilts and comforters, choose a warm sunny dav so that they will dry as quickly as possible. Use soft water if it can be obtained.

Blankets.—Woolen blankets should be washed in luke warm water, never in hot or cold water as it shrinks them. Use a good white soap or some reliable woolen soap. Put the blankets to soak for fifteen minutes in warm water, soaping the blankets as it is put in the tub, putting on a little extra soap where the blanket is most soiled. After allowing to soak, work the blanket around in the tub, rubbing between the hands and applying more soap where needed. Souse the blanket several times and wring into another warm water, going over the blanket to see if any soiled places have been missed. Rinse a second time, wringing the blanket as free from water as possible. Shake well before hanging up to dry. Roll each corner a trifle and pin with a small safety pin to prevent the corners from whipping out. When dry they will be fluffy and soft, ready to fold away for another winter. Another way is to stretch the blankets on curtain stretchers, putting them on double.

Comforters.—Never rinse comforters in cold water as it tends to harden the cotton batting. Comforters are washed in the same way as blankets only the water should be fairly hot and they should soak a couple of hours in a good hot soapy water to loosen up the dirt. The end or any parts may be rubbed on a washboard or washed in the washing machine. After the comforters are dry, roll and beat with a smooth round stick. This will loosen up the cotton and make the comforters more fluffy.

Quilts.—Wash same as the comforters except that where the colors will not run they should be scalded to make them more clear and fresh.

Tempting Dishes.

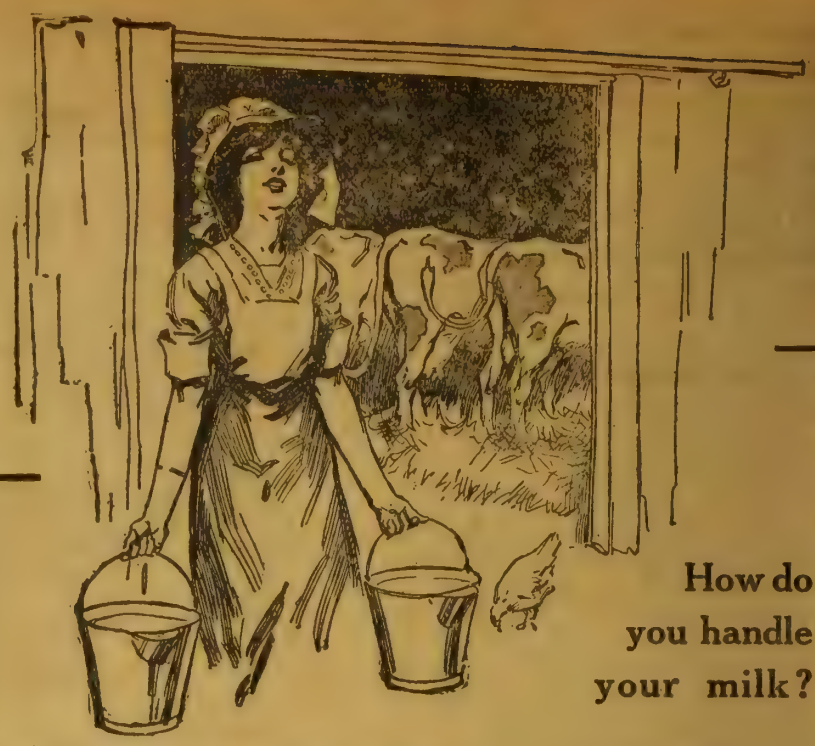
Dandelions. — Gather only fresh plants and wash thoroughly, boil until tender, chop and season with salt, vinegar and butter. If too bitter to suit the taste, use half spinach or young beets—tops and all. If cooked with spinach, do not add that plant until dandelions are half cooked.

Spinach — Thoroughly wash and trim the spinach; place in boiling water; let it remain uncovered and cook about ten minutes; remove from fire, drain away every bit of the water; chop fine; season with salt, cream and butter. Heat well and serve at once.

Asparagus—Cut the pieces in bits and boil till tender; drain, and to two bunches add one-half cup of cream and one-quarter teaspoonful of salt. Simmer and serve like green peas.

Baked Rhubarb—Wash and cut in half-inch pieces. If young and tender it needs no peeling. Place in earthen baking dish with an equal amount of sugar, by weight, as of rhubarb. There will be jucie enough without adding water. Bake until tender.

Egg Salad—Cut a slice from the small end of as many hard boiled eggs as needed; cut the edge of whites in points and then remove the yolks. A tiny slice cut from the other end to stand upright. Rub the yolks fine. Season with salt and prepared mustard, or with any good salad dressing. Refill the whites with this mixture. Arrange upon lettuce leaves and garnish with small white radishes.



How do you handle your milk?

ARE you getting every cent, per quart, out of your daily milking? It's all a matter of method. When you know you are disposing of your dairy products in the most profitable way—only then can you take the interest in your dairy that will make it a complete success. Make a comparison by actual figures of your present dairy earnings and what they would be with a

SHARPLES
TUBULAR CREAM SEPARATOR

This is easy to do. There is a Sharples agent near you who can quickly bring the facts down to a basis of dollars and cents. Have a talk with him.

He will demonstrate the Sharples to you—the unequaled skimming power of its wonderful tubular bowl—the bowl that has only 3 simple parts, which naturally makes the washing and cleaning a very simple matter.

To buy a Sharples is not an expense. You simply apply your money to a most profitable investment so that you make it over and over again, year after year.

And the Sharples name is your bond—as it has been for hundreds of thousands of farmers and dairymen for 32 years.

Write for our Separator literature. And if you do not know our nearest agent, mention the fact in your request.

THE SHARPLES SEPARATOR CO.
West Chester, Pa.
Branch Offices: Chicago, Ill. San Francisco, Cal. Portland, Ore. Dallas, Tex. Toronto Winnipeg
Agencies Everywhere

If you milk twenty or more cows, the Sharples Mechanical Milker holds out wonderful new prospects for you. Write for catalogue.

Care of Baby's Flannels

The baby's underwear should be of flannel, as soft and fine as the mother can afford, and kept in the best condition by washing it properly. A careless laundress can ruin the best woolen garments in a few washings, making them so shrunken and rough that they irritate the flesh. The following method has been used for years with success, the little garments retaining their soft, fleeecy look until worn out:—Use water that is as hot as you can bear your hand in comfortably, for flannel cannot be boiled, and hot water cleanses and purifies it. Dissolve a little borax in it (the amount depending upon the kind of water you use), and add enough soap to make a strong suds. Wash the flannel through two waters prepared in this way, plunging them up and down and rubbing gently between the hands until they are clean. Soap should never be rubbed directly on the flannel; borax softens the water, making very little soap or rubbing necessary. Rinse through clear water of the same temperature as that used for washing, and pass them through a rubber wringer. Then just before hanging them out, pull and stretch every piece in shape, for if this is neglected the tiny fibres run into each other, causing it to become hard and shrunken. Place them smoothly on a line in the sunshine, where a gentle breeze will blow through them, pinning securely When it is necessary to dry them indoors, hang them on a line above the stove where the hot air will circulate through them. Little garments which have shrunk and become hard and stiff should never be used again—babies' bones are so soft that any constriction is injurious.

Healthful Perfumes

The art of perfuming in all ite refinement comes to us from the Italians, and it has remained for an Italian to discover also that perfumes are actually healthful. He confines his theorizing largely to the domain of the vegetable kingdom, including the old-fashioned sweet-smelling herbs that our grandmothers loved to have about them. Among these are

cherry, laurel, cloves, lavendar, mint, juniper, lemons, feonel, and bergamot. These exercise a healthy influence upon humanity by converting the oxygen into ozone. In the perfumes just mentioned there is a large quantity of ozone. Among those of aid in this manner, but in a less degree, are anise, nutmeg, and thyme. Among flowers that are medicinally qualified are the hyacinth, mignonette, heliotrope, and lily of the valley, all of which have ozone enclosed vessels.

Value of Oatmeal in Youth

It is a thousand pities that oatmeal porridge is not used more frequently for the children's breakfast, for it is such an excellent bone and muscle former. If you want your children to become strong men and women, remember oatmeal, combined with fresh milk, is the foundation stone of the diet of the day. Never let a child have tea or coffee, bacon, sausages, marmalade, etc., for his breakfast. A bowl of porridge with milk and bread and butter (brown bread for preference) is all he requires. This is the first step to keep him fit, and, if necessary, ready to fight any illness which may attack him. Care must be taken to have fresh, good oatmeal, and much better to take the porridge without adding sugar.

Mental Degeneracy

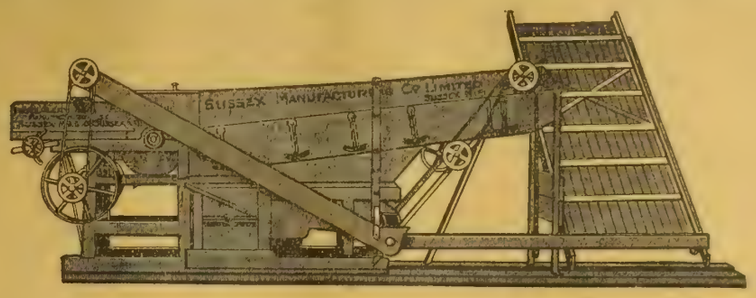
Dr. Forbes Winslow, the mental specialist, says that "No disease is more liable to transmission by heredity than mental disease. Fully 66 per cent of the lunatics in London asylums have hereditary connections with the disease. More than 700 of them are closely related to one another—parents and children, brothers and sisters, and so on. But those in asylums are not so dangerous to the community as the feeble-minded who are at liberty to have children. This is why degeneracy is increasing so alarmingly. In 1859 there was one lunatic for every 586 sane persons; to-day the ratio is one in 275, and in less than 300 years, unless drastic steps are taken, there will be more lunatics and degenerates than sane people amongst the Western nations"

Shingles or Herpes

The direct cause of the appearance of shingles is some affection of the nervous system. Both sexes suffer from it, and young persons most frequently. Cold appears sometimes to be the cause, though shingles rarely shows itself in those who are in robust health. Symptoms: The first symptoms are much like those of an ordinary feverish attack. The person feels seedy for some days, has a slight rise of temperature, vague pain in the side or other parts. This pain finally settles in the side, and after two or three days the rash appears. Minute yellow blebs are seen on the skin of the back, side, and chest. These blebs increase for some days, until there is often a complete half girdle on one side of the chest. The pain at this stage is severe, though it varies with different people according to age. After aweek or so most of the vesicles dry up and form scabs, which fall off, leaving the skin much as it was before. A peculiarity about the pain is that it may go on for several weeks; especially is this the case with old people. Treatment: If any cause for an attack of shingles be known it should be removed. Thus, if the affected person is in poor health tonics are necessary. In the early stages before the blebs have formed an ointment, prescribed by a doctor, well rubbed into the side, will ease the pain and prevent to a certain degree the eruption. Later, when the blebs have formed and are discharging, a fine dusting powder of stout zinc oxide and bismuth subnitrate does most good, and the whole part kept warm by a layer of cotton-wool or gamgee.

The Best Judge of a Thresher is the man who has used it

It is not the purpose of this advertisement to tell in detail the merits of the Little Giant Thresher. This is simply an expression of the opinion of a man who has used it, which is, perhaps, better evidence of its superiority than anything we can say. Any reader who is thinking of purchasing a Thresher will get our descriptive catalogue on application.



Four Horse Thresher

Description of Four Horse Size

Dimensions of Cylinder -	17 x 30
Size of cylinder shaft -	1½ inch
Speed of Cylinder,	900 to 1000 Rev.
Size of Sieve -	31 x 36
Weight not mounted -	1700 lbs.
Weight, with wheels, etc.	2200 lbs.

Woodstock, Dec. 12th, 1911

THE SUSSEX MANUFACTURING CO. LTD.
Sussex, N. B.

Dear Sirs:—I can say in regard to your Four Horse Threshing Machines, that I have used many makes of machines, but will say that the Sussex Little Giant is the best I ever used, it runs easy and cleans good and without any waste of grain.

Yours truly,
F. D. BURPEE.

This is just one of hundreds of similar testimonials we have.

We make the Little Giant Thresher in four different sizes; one horse, two horse, four horse and ten horse power.

Threshers can be supplied with or without tailings elevator and bagger. Every machine is guaranteed for one year against all defects in workmanship and material. We carry a large stock of Thresher Teeth and other repairs.

All enquiries will receive prompt attention.

Preserving Life of Young Trees.

A man can not stick a tree into the ground and give no attention to it and gather fruit from its branches in after years, writes W. D. Neale. The life of the young tree must be guarded zealously. The careful orchardist is the man who realizes profit from his fruit trees.

In the summer time as well as in the fall the young trees need special care. They must be protected from the ravages of animals and from the drouth. The orchard should not be turned into a pasture where stock may roam at will. I have seen hogs, horses and cows running in the orchard, and the young trees would be broken and stripped of their leaves. This meant disaster to their future growth. Then, too, the ground was so firmly trodden about the young trees that many of them perished before the summer was gone. Better to keep stock from an orchard at all times than to allow any injury to the trees.

The hot weather of July and August is very trying to the young orchard. If the hot sun does not blast the trees, the moisture about the roots is sometimes so exhausted that the trees suffer and die. I have found it a good plan to mulch the trees to preserve their moisture about the roots. For this purpose straw, grass or weeds may be used. If this is spread over the depth of 2 or 3 inches about the trunk of the tree, the moisture will rise beneath it and the sun will not evaporate it very rapidly. The ground should be loose when the mulch is spread.

Picking Strawberries.

Strawberries keep much longer if picked with their stems left on. The old-fashioned method was to pull the berries, but it has been found that one can pick them as quickly by pinching the stems with the thumb nail. There has been considerable talk about precooking berries before sending them to market. We cannot see that this would pay in the case of our local markets, but doubtless it would be of immense value were we shipping to any great distance.

At what stage of ripening should we pick strawberries? is the next question. We cannot set any hard and fast rule. We believe in allowing the fruit to mature as much as possible. However, we cater more or less to market requirements. Some demand fully matured berries. Toronto will not accept berries unless red all over. Montrealers are not so particular as to draw the line at partially green berries. At all events the patch should be picked over so often that no fruit becomes soft.

Use of Kerosene.

It is largely a matter of trial whether any particular carburetor will enable kerosene to be used. The general experience is that a specially-designed carburetor must be used to obtain proper vaporization of the kerosene and, therefore complete combustion. Some gasoline carburetors, if mounted close to the engine and kept at a comparatively high temperature, will give some measure of success with kerosene, but not full power or a smokeless exhaust as with gasoline.

CORNS IN MARE—I have a mare that is troubled with corns which often fester. I should be glad of advice how to treat them.—Troubled.

Give the animal a rest until the foot is somewhat restored and then try the effect of a three-quarter shoe. In the case of festering apply a poultice to the foot and protect the place from injury. In the case of a dry corn much harm is often done by excessive paring out.

SPECIAL ADVICE FOR MEN

Strength Restored By New Method

The little book described below (which I gladly send free, sealed, by mail, to any young or elderly man anywhere) contains in its 85 beautifully illustrated pages everything a man need know with regard to certain strictly personal subjects, and as a guide through his entire life, from the delicate period of youth, when wholesome advice is most needed, on through early manhood to a ripe, vigorous, healthy old age. Over a million of these books have been thus distributed by me all over the world. Therefore, please use coupon below and get YOUR free copy by return mail. SANDEN CO., DISTRIBUTORS.

Do you know, my friend, that there is a wonderful new way to apply a certain, great, natural FORCE to your body, and by which you may, without effort, trouble or inconvenience, treat your own self in the privacy of your home for debility and lost vitality, without using a single drug or medicine? This great FORCE, as a restorer of vitality and as a means to overcome those weaknesses which result from indiscretion and unnatural practices, is to-day being used all over the civilized world, and I give it as my honest opinion, based upon a vast observation and study, that any man anywhere, who leads a decent, manly life and who applies this marvellous FORCE in a scientific and rational way, can, without employing a single drug, be restored again to a state of perfect, rugged health and vigor, without a remaining ache, pain or weakness.

MANLY MEN ARE THE WORLD'S POWER TO-DAY

As we all know, these debilitating weaknesses handicap a man in every condition of life, while, on the other hand, a perfect specimen of vigorous, robust, lusty manhood is ever admired by both women and men alike, while, of course, it is certainly only such a man who can attain the really great success of life. Therefore, I say to you, no matter what your size, whether you are small or large, no matter what your occupation, no matter whether you are a college graduate or working on the farm or in the factory, no matter whether you are young or elderly, it is all a question of your vigor and your vitality, and if I can give you a good, abundant supply of this same great power of VITAL FORCE, then it is easy to believe that I can completely restore your vigorous health, can overcome the evil of past indiscretions so you will be exactly the same in your influence over people, exactly the same in your manly bearing as other manly, strong-nerved, warm-blooded fellows of your acquaintance.

With an idea of attaining this all for you, I recommend you to investigate a simple little VITALIZING APPLIANCE of my invention, which I am now sending out in great numbers for use by men everywhere who need new manly strength. This little VITALIZER is very light, weighing only several ounces, and can be worn without any one suspecting that you are wearing it. You buckle it on your body upon going to bed and take it off mornings. Thus while you sleep it sends its wonderful power, which I call VITALITY or VITAL FORCE, into your blood, nerves and organs. Users say it takes pain and weakness out of the back from one application, and further say 60 to 90 days' time is sufficient to restore a state of health, strength and vigor. I am not offering this VITALIZER here for sale, but want you first to send for my book, that you may learn all about the whole wonderful subject, and why I get such quantities of testimonials from users everywhere telling of results after drugs completely and utterly fail.

NOTE:—With special attachments VITALIZER is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, nervousness and general ill health. Please write for book to-day, or, if near by, I should like you to call. Hours—9 to 6.

Use Coupon; Get Free Book

Remember, the little illustrated book which I send free, sealed, by mail, as per coupon below, not only fully describes my VITALIZER, telling of a special offer by which you may get one on special terms for use in your own case, but contains a great fund of private advice for men, some good, wholesome cautions, and a lot of general information that might be of value to you to the end of your days. Therefore, please write or call.

DR. M. F. SANDEN CO.,
140 Yonge St., Toronto, Ont.

Dear Sirs:—Please forward me your book, as advertised, free, sealed.

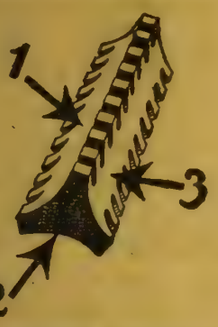
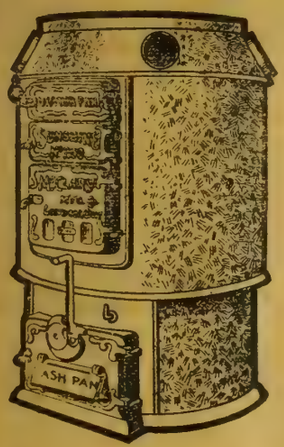
The Two-piece Firepot



Three-sided Grate Bars



Install A Modern Furnace

One With Latest Features, And Built To Last

CONSIDERING its extra weight, the superior quality of the materials, the skill and experience put into it, McClary's Sunshine furnace is the cheapest furnace on the market. You get more value for every dollar you invest in the Sunshine than you do in any other furnace.

McClary's Sunshine Furnace is the product of the largest stove and furnace makers in the British Empire. It has labor-saving, health-producing and fuel-economizing features—the result of long experience—that no other furnace has.

It has, for instance, the "rocking-down" system which eliminates the old-time back-breaking, dirty shaking. It has a conveniently located water-pan over the fuel door. It has a sure-acting dust-flue to prevent dust from falling ashes getting into the house. It has an almost straight-sided fire-pot to prevent ashes forming "pockets" and deadening the fire. And some coal-economizing features our agent will be glad to tell you about.

But, too important to overlook, is the fact that the Sunshine furnace is built to last. The materials are the best, and every piece of metal is tested. Every operation in the making is inspected, too. Nothing is left to chance.

As an example of the quality of materials used, take the fire-pot. This is of semi-steel—not gray iron as are other fire-pots. Semi-steel is not affected by sulphur fumes from burning coal. In addition, a semi-steel fire-pot weighs twenty per cent. more than the same size and pattern in gray iron.

But that's not all. The fire-pot is in two pieces to prevent it cracking from extreme expansion or contraction. One-piece fire-pots are continually cracking, having to be replaced.

Then take the grate bars. Those on the Sunshine are very heavy and have three sides—three lives. By exposing a different side to the fire every few days, the life of the grates is greatly prolonged.

Examine the dome, too. It is of heavy steel, as is also the radiator. The frame of the ash-pit, the doors on the furnace, the casing—every part of the furnace is of the most durable material. All joints are accurately fitted together, and rendered dust-tight by a special cement originated by McClary's.

Last, but not least, the McClary Company place the services of their corps of experienced installation men at your disposal. These men will assist you and the McClary agent in your locality to plan the arrangement of your heating system. They will also co-operate with you in other ways to insure the proper installation of your furnace.

Furthermore, the Sunshine furnace is guaranteed to heat your house to your satisfaction, if installed according to the directions of the McClary experts. You therefore run absolutely no risk in having one installed.

Send your name and address to our nearest office, with particulars about the size of your house, and we will tell you about how much it will cost to install a McClary's Sunshine in your home. The latest Sunshine booklet is also free on request.

A Whitewash For Stables.

For the brightening and improving of the appearance of stables, as well as rendering them more sweet and sanitary, there is nothing more effective than whitewash. It is inexpensive, easy to prepare and can be applied to any surface, smooth or rough.

Old buildings, timbers, stone or plaster may quickly be covered with a coat of bright, clean whitewash, a fresh appearance given to dark rooms where it would be very difficult to apply a coat of paint. The cleansing effect of lime is also far ahead of paint. Various tints can be had by the use of Prussian blue or other materials added to the wash, but the white effect secured by the lime alone can hardly be improved by any addition of other colors.

A whitewash recommended by the Government Experiment Station has been given before, but as dairymen are always interested in whitewashing stables we give it again. This is slightly different from the regular government whitwash in the addition of sweet milk to the mixture. The use of the spray pump is growing in popularity, as it saves much time and enables one to do a much better and more satisfactory job.

For the making of each gallon of whitewash, stir in a pint of glue which has dissolved in water until it is of the thickness of mucilage. Also, for every gallon af the wash use a pint of well boiled starch or flour paste clear of lumps. For every gallon of the wash, stir in a quart of boiled sweet milk from which all cream has been separated. Boil a pound of rice in two gallons of water strain, and use the rice water for sizing.

The spraying of stables with a good coating of whitewash will have a good effect for two or three months, after which another coat may be as easily applied. Regulation government whitewash is made as follows: Slake ~ half bushel of unslaked lime with boiling water and cover to keep through a fine sieve and add a peck of salt dissolved in warm water, three pounds of ground rice boiled to a thin paste and stirred in while hot, half a pound of Spanish whiting, and one pound of clear glue previously and then heated over a slow fire in a small pot hung in a larger kettle of water. Add five gallons of hot water to the whole mixture, stir well and let stand a few days. It should be applied hot.

Scouring Lambs.

Shall be much obliged for an answer by post to the following as early as possible. Some of my lambs are taken, when a day or two old, with scour. A very pale yellow runs from them like water. After a few hours they go dull and sleepy, lose the use of their limbs and die. I have had infectious scour among the calves and wondered if lambs could catch it. The fields they run in are rather wet, but some are lambed inside. Shall be glad if you can tell me the cause and remedy.—T. M.

We advise you to make a post-mortem examination of one of the dead lambs, examining the stomach and bowels for worms and for wool acting as foreign bodies. Also change their pasture if possible, and get them on to drier surroundings. It may be that the ewe's milk is too strong from artificial feeding, and if you are giving cake or turnips I would lessen the quantity or stop it altogether.—Vet. Surgeon.

Summer Management of Flock.

The flock should be shorn and dipped before turned out to the summer parture, because if relieved of the heavy fleeces and free from ticks they will summer far better than those that are compelled to carry the long shaggy wool during the summer and in addition suffer from the torturous ticks which are found in large numbers on individuals that are not dipped. It is economy to shear in the springtime because if the shearing is not done at this time much of the wool is apt to be shed during the hot summer months and of course lost.

There are a number of different kinds of dipping preparations on the market and most all of them serve their purpose. The coal tar preparations are extensively used as tick eradicators and generally give satisfaction. The dipping should take place shortly after shearing as the wool is then short and comparatively clean and the work can be accomplished with a much cleaner solution than if the operation is postponed until some weeks later.

If your flock is known to be infested with worms the best thing for you to do is to get on a pasture that was not pastured by sheep during the previous summer. If the pasture can be partitioned off into several separate inclosures without involving too much extra expense it should be done by all means, the object being to change the sheep to a fresh pasture several times during the summer so as to lessen the danger of the lambs becoming infested with the young worms hatched from the eggs voided with the droppings from the mature sheep.

The Fall Term
—AT—
FREDERICTON
The Business COLLEGE
W. J. OSBORNE PRINCIPAL.
OPENS ON
TUESDAY, Sept. 2nd

If you have not already had a catalog send for one at once. Address

W. J. OSBORNE, Principal,
Fredericton, N. B.

Each age of our lives has its joys. Old people should be happy, and they will be if Chamberlain's Tablets are taken to strengthen the digestion and keep the bowels regular. These tablets are mild and gentle in their action and especially suitable for people of middle age and older. For sale by all dealers.

If you expect your lambs to make the fastest possible growth, allow them access to a rape patch adjoining the pasture, a creep being provided so that they can readily squeeze through the opening, while their mothers will be held in check.

The dwarf Essex variety of rape is very popular and widely cultivated. It requires a rich, moist, loamy soil and does not grow well on light, sandy or heavy clay soils. If you have a soil that produces good turnips or rutabagas you can be practically assured of a good stand of rape from the same soil.

Rape may be either sown broadcast or in drills from 24 to 30 inches apart. When sown in drills the sheep tend to walk between the rows when grazing and do not trample an the leaves as much as when it has been sown broadcast. It depends largely upon climatic conditions as to the length of time required until the rape will be ready to be pastured. Usually rape should have from 12 to 18 inches growth before the sheep are allowed to graze it.

It is generally rather difficult to put the sheep on to a rape field without part of the flock becoming afflict- with bloat. Following are a few valuable suggestions for the amateur.

1. Never turn the sheep into the rape patch for the first time while there is moisture on the leaves. Wait until some hot, dry afternoon.

2. Give them a liberal feed before turning them in and they will not eat enough rape the first afternoon to cause any injurious effect.

3. After they have had access to the rape for about two hours drive them out and do not let them return to the rape field until the next afternoon, and then preferably under the same conditions as on the previous day. After this has been repeated for three consecutive days there should be no further difficulty experienced in safely accustoming the sheep to the new feed and they can be left permanently on the rape.

After weaning time, which should occur when the lambs are about five months of age, the ewes as well as the lambs should be given acress to a good rape field. By putting the breeding flock on rape they are rapidly brought into a good, healthy condition and the breeder will be practically assured of a large lamb crop for next year, because strong healthy sheep are more prolific breeders than those in a run-down or weakened condition.

Rape is an indispensable forage crop for the sheep grower, and is the best green feed for fattening and finishing lambs and mutton for the market.—J. M. Jones in N. E. H.

Good Rich Milk.

The critical consumer of milk may give a snap verdict on the glass of good rich milk given him in the restaurant or at home, and may vagely wonder what percentage of fat the milk is supposed to contain. Certain standards of richness are fixed by various countries and by municipalities, while some purchasing companies and dealers also set a standard low which the milk must not fall. The knowledge of the average test the herd, interesting as it is, is not valuable to the progressive dairyman as a knowledge of what each cow's milk tests. Whether it is 2.9, 3.4, 4.5, or 5.6 per cent. of fat depend on various factors and can only be ascertained after systematic sampling and testing. Such testing sometimes reveal curious facts. A pet cow whose "good rich milk" was reserved for table use was recently discarded by a farmer when cow-testing proved to his dismay that her milk was nearly the poorest in the herd.

The average test of the herd is a vital matter to every dairyman whose milk is paid for at the cheese factory by the test; it is of decided importance to both creamery manager and patron when considering the by-product of skim-milk for feeding and the loaded wagon for the cream-hauler. For two lots each of 16,500 pounds of normal milk may contain either 500 or 900 pounds of fat; one lot is scarcely the best for cheese-making while the other would be "good rich milk."—C. F. Whitley.

"EASTLAKE" METALLIC SHINGLES FOR YOUR HOME ROOF

A Leaky Roof
is the despair of every householder.
It costs money to repair and frequently causes extensive damage.
You can avoid this by the use of "EASTLAKE" METALLIC SHINGLES.
Absolutely water-tight—more durable than wood or slate and look better—last a life-time with no repairs.

Causes of Bitter Milk.

Bitter milk may be due to turnips, a weed in the pasture, or to the use of other foods capable of imparting bitter or disagreeable flavors to the milk. In other cases bitter flavor is due to certain germ affections which bring about chemical changes in the milk producing the bitter flavor. This usually occurs in the case of milk that is sweet when drawn but in the course of several hours, even days, a bitter taste develops due to certain bacteria.

There is a less common and less important form of bitterness which develops in milk that has been heated and has stood for several days. In this case it may not sour or curdle but may become quite bitter, because of the presence of certain spore-bearing heating.

Correct the fault in feeding in the first case or disinfect the cow's teats and udder thoroughly before milking. Scald thoroughly the milk pails and all milk utensils. Do not leave milk standing uncovered in the stable; and especially do not rinse out any milk strainers with unboiled water, after they have been carefully sterlized by washing.—M. H. Reynolds, Veterinary, University of Minn.

A Time Saver.

The favorable weather of June is bringing some good records of milk produced by cows trained to the business by far-sighted owners. Grade cows yielding as much as 2,300 pounds of milk and 65 pounds of fat in thirty days are well worth keeping as many factory patrons can testify.

On the other hand some poor records were made during May in several districts, not only in yields of milk but in many instances in peculiarly low percentage of fat; even less than two per cent. That is one good reason why it pays farmers to take up cow testing, for with the tests ranging, as they frequently do in the same herd from 2.1 to 4.3 with common grade cows giving almost the same weight of milk and handled under similar conditions, there is evidently plenty of room for considerable difference in returns.

As a matter of fact, cow testing was never more needed than at the present time when farmers are complaining that it is hard to get good hired help. The time saved in taking a few weights and samples is saved over and over again, a hundred times over, when it proves to a man that he saves time by milking profitable cows only. Why waste precious time month after month, year after year, on cows that test only two per cent. of fat?

Encouraging the Breeding of Standard Breds.

To encourage the breeding of Standard Bred horses, the Canadian Standard Bred Horse Society, is this year donating $50.00 to each of the following Shows for the best Standard Bred Brood Mare with Foal by her side:—Canadian National Exhibition, Toronto; Canadian Industrial Exhibition, Winnipeg; Central Canada Exhibition, Ottawa; Edmonton Exhibition Association, Edmonton; Great Eastern Exhibition, Sherbrooke; Nova Scotia Provincial Exhibition, Halifax; Regina Exhibition Association, Regina; Western Fair Association, London; Saskatoon Industrial Exhibition, Saskatoon.

All animals of course, entered in the different classes at these Exhibitions, must be recorded in our Stud Book.

TheCanadian Standard Bred Stud Book was not opened until the fall of 1910, but already we have accepted for registration over 1100 horses, and Volume I will be published this year. All owners should have their horses appear. It is therefore desirable that application for registration be sent to the Accountant, Canadian National Live Stock Records, Ottawa, at once. The cost for registration is $1.50 to members, and $3.00 to non-members. Annual membership fee is $2.00.

Yours truly,
Jno. W. Brant
Secretary.

The Fredericton Exhibition.

$15,000.00 in premiums is the handsome trophy set up by the Fredericton Exhibition which is open to Canada and State of Maine. W. S. Hooper, the genial and though young in years veteran manager is in charge and exhibitors and the general public may rest assured of the usual courteous treatment accorded them in the celestial city. Tempting prizes are offered in each and every section and farmers and stock breeders throughout the Maritime Provinces will find it to their best advantage to plan to make exhibits in as many sections as possible. If you do not make an exhibit plan a holiday for September 15 th to 20th and visit the exhibition to see the progress that is being made agriculturally in eastern Canada. Entries close on September 1st.

Compressed Air Spraying

It was in Ohio, in the year 1911, that the legislature passed a compulsory spraying act. It has not been repealed, nor is it likely to be. The result has been better fruit and the careful fruit growers are prevented from suffering from the carelessness of the careless ones. If we had a compulsory spraying act in the Maritime Provinces, it would (provided it was honored in the observance more than the dog tax) be a grand thing. But we haven't such an act and it's up to the individual fruit raiser to do his part willingly.

Spraying costs money, takes valuable time, but it pays. The problem is how to get the most and best work done for the least expense. Trucking a heavy gasoline engine around a big orchard is a nuisance. Only those with very small orchards can think of hand spraying. The compressed air sprayer is the solution.

Compressed air sprayers, of course, need power to compress the air, but the engine does not have to be hauled back and forth among the trees. Two tanks are used, one for the spraying mixture and the other for compressea air. There is a mechanical agitator to keep the solution well mixed and the pressure is abundant for the most effective work.

Better than reading a description of these modern sprayers is a visit to the orchard of Rev. G. P. Raymond, at Rockland N. S. Mr. Raymond has been the first to bring one of these outfits to Nova Scotia and he is enthusiastic in its praise. He conclusively has proven that compressed air spraying means a saving of time, of labor. of money, and such a saving is essential to the progress of a fruit grower in these keenly competitive days. He welcomes all visitors cordially.

Work-Horse Parade Figures

The statistics of the recent Work-HORSE Parade in Boston disclose some interesting facts. There were 1231 entries, and of these only 89 failed to appear, a much smaller percentage of absentees than is usual. There were 1516 horses actually present. In the Boston Parade every entry that deserves a ribbon receives one, and the ribbons were awarded as follows: 1st (blue) 765; 2 (red) 35; 3rd (yellow) 51.

No horse that was lame, thin, or badly groomed received a ribbon, but the number thus disqualified was astonishingly small, being as follows: 17 for lameness, 16 for bing thin, 6 for being badly groomed. These results show how much the horses in Boston have improved in quality and condition since the first annual Parade ten years ago.

Owners of horses everywhere might, by a little encouragement, by awakening the pride of their drivers, and perhaps by offering them occasional slight rewards greatly improve the condition and treatment of their horses and save thousands of dollars a year in the wear and tear of horseflesh.

Slow Feed Manger

I have a horse which when fed in an open manger eats his feed so rapidly that it is not properly chewed, and therefore does him little good. I have made a device which I employ to make him eat slowly. A box made of four boards 16 in. long and 8 in. wide, nailed together to form a chute, having no top or bottom. The chute is 16 in. high and 6 in. by 8 in. inside.

It is set upright in the corner of the manger farthest from the horse, and nailed securely in place after being lifted one to three inches from the bottom. The feed is poured into it, and works down into the manger as the horse eats it away from below. What feed the horse cannot reach should be scraped out before the next feed is poured in, otherwise it would become sour and mouldy.

Big Fruit Farm
$3050 Income Last Year

220 Acres, borders water offering best of salt water advantages; good 8-room house with running water; 40-ft. barn; near P. O., boat landing, store, etc.; apple orchard producing 600 bbls. in season; variety small fruits; good chance to develop large commercial orchard; cuts 30 tons hay; wood and timber valued at $1000; owner an old man must sell; if taken immediately price only $3200, part cash; for all details and traveling instructions to see this and many other farm bargains throughout N. S. and the States, see page 67, our "New Mammoth 75-Page Farm Catalogue No. 36;" beautifully illustrated and filled with a wonderful assortment of money-making farms; send today for your free copy, it will save you lots of time and money. Box No. D, Sussex, N. B.

Concrete is the best building material

A BROAD statement—Yet literally true. The aim of man from the beginning has been to make his building materials as nearly like natural stone as possible. The great labor required to quarry stone led him to seek various manufactured substitutes. The only reason he ever used wood was that it was easiest to get and most convenient to use.
Wood is no longer easy to get. Like most building material, its cost is increasing at an alarming rate.
The cost of concrete is decreasing. So, from the standpoint of either service or economy, Concrete is the best building material.
Canada's farmers are using more concrete, in proportion to their numbers, than the farmers of any other country. Why?
Because they are being supplied with

Canada Cement —

a cement of the highest possible quality, which insures the success of their concrete work.
The secret of concrete's popularity in Canada lies in the fact that while we have been advertising the use of concrete, we have also been producing, by scientific methods, a cement so uniformly high in quality that the concrete made with it gives the complete satisfaction our advertisements promised.
Concrete would not have been in such universal use today, had an inferior grade of cement been supplied. Insist upon getting Canada Cement. It is your best assurance of thoroughly satisfactory results from your concrete work. There is a Canada Cement dealer in your neighborhood.

Without this label it is not "Canada" Cement.

Write for our Free 160-page book "What The Farmer Can Do With Concrete" —No farmer can afford to be without a copy.

Canada Cement Company Limited • Montreal

Constipation

is an enemy within the camp. It will undermine the strongest constitution and ruin the most vigorous health. It leads to indigestion, biliousness, impure blood, bad complexion, sick headaches, and is one of the most frequent causes of appendicitis. To neglect it is slow suicide. Dr. Morse's Indian Root Pills positively cure Constipation. They are entirely vegetable in composition and do not sicken, weaken or gripe. Preserve your health by taking

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

It is now well known that not more than one case of rheumatism in ten requires any internal treatment whatever. All that is needed is a free application of Chamberlain's Liniment and massaging the parts at each application. Try it and see how quickly it will relieve the pain and soreness. Sold by all dealers.

P. E. I. Crop Report.

The weather during the month of May was unsettled, cold and backward, with much light rain and mist, but scant precipitation. Light frosts were frequent through the month, and on the 19th a heavy thunder storm swept over the western part of the province. Growth was very slow.

Hoar frost occurred on the first of June; very heavy rain on the 2nd, 4th and 6th, and light showers on the 7th, 8th and 9th. Since the first of June conditions for rapid growth have been very favorable.

HAY—The present prospect for the hay crop in King's County is above average, in general the clover has come through the winter in good condition; in Queen's good; a few correspondents report excellent and three very poor; in Prince only fair, particularly west of Summerside, where the clover has been badly killed.

GRAIN—There is nothing unusual in seeding conditions except the cold and backward weather. In a few sections very little wheat has been sown on account of the depredations of the Joint Worm in former years. There is also a slight increase reported in the acreage sown for summer feeding.

HOED CROPS—The acreage sown to turnips is about the same as in former years. Corn and mangels are not popular crops, but a lot of the farmers seem to be planting larger fields of potatoes.

BALED HAY of good quality is scarce; Oats is fairly plentiful and there is an abundance of potatoes still for sale, although they are being fed liberally to all classes of live stock.

CATTLE have gone on the grass in about the usual condition, although a large number of correspondents report that they have been turned out early and very thin, and attribute their lack of condition to the poor quality of hay, which was more or less spoiled in the making by the heavy rains of July and August.

There has been some irregularity in the lamb crop. Some have had excellent results, and others the opposite. One correspondent writes: "We have saved 100 per cent. of our lambs for the first time in thirteen years, all on account of giving the sheep good care during the winter." Another says: "The sheep in this district have averaged nearly a lamb and a half each, and all large and strong." Still another reports lambs as being very scarce.

The milk supply is about the same as last year, but nearly all the correspondents report an increase in egg production.

Correspondents report considerable interest being taken in, and quite a lot of preparations being made for the Live Stock Judging Classes to be held in June and July. They also state that there will be a large number of entries in the Fields of Standing Grain Competitions this year.

Ringing a Bull.

J. H. D.—I have a Holstein bull calf seven months old. When should I put a ring in his nose and how shall I proceed and what kind of a ring is best to use?

Would you advise using calf for service before he is 12 months old?

A bull calf seven months old should have a ring put in his nose, and taught to lead with it. The opening in the nose is made by the use of a trocar which may be purchased at a hardware store. Copper is the common substance used in making rings but some are made of iron covered with tin.

A calf may be used for light service when he is 10 or 11 months old, but it is better to wait until he is at least a year old.

BACK of EVERY LOAF

You put in the oven, must be good flour or your bread will be a failure.

REGAL FLOUR

is your best guarantee of success in bread making, and if you see to it that every barrel of flour you buy bears the *REGAL* brand, you can be sure you have the *one* flour that excels in every good quality.

Buy a barrel today. try it, and if it isn't satisfactory we'll give you your money back.

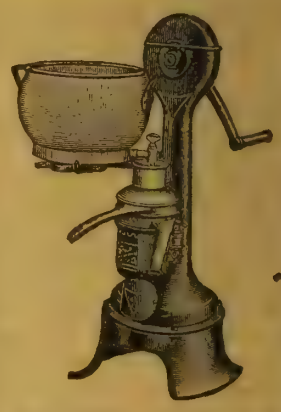
Cut Your Work in Two

By starting in to use a large capacity

Waterloo Boy Cream Separator



The favorite everywhere it goes. Note the heavy compact construction, with low down handy supply can.

The 900 lb. size Waterloo when at speed and skimming takes no more power than the ordinary 500 lb. size separator of other makes.

The large capacity Waterloo hand separator will save you time, labor and expense, because it will cut the labor of skimming the milk more than in two, not only because it turns easier than most other hand separators, regardless of capacity, but because it does the work in half the time.

In these busy days, when labor is so scarce and so expensive and so unsatisfactory, a saving in time is a great direct saving in money to you.

Please write us a post card to-day asking for Free book describing this cream separator.

The Sussex Motor Co., Ltd.,
SUSSEX, N. B.

We have for sale a few second hand machines of other makes that we have taken in exchange for our Waterloo Boy. Come in and see them.

FLORICULTURE.

Correspondents from St. John, Chatham, Marysville and Yarmouth will find answers to their enquiries below:

The little insects on the Heliotrope leaf is the Aphis, or green-louse. It is not common on this plant and you will have to use fir tree oil or kerosene emulsion as you cannot fumigate plants of this species without loss of foliage.

Yes, Calecolarias may be fumigated with tobacco, if care is used that the tobbacco is thoroughly wet.

I do not think that there is any danger of aphis spreading to your Geraniums, except the Kenet Geranium, which is often infested with those pests.

I cannot imagine what kind of Lily the Autumn Glory is. You had better send a leaf and bloom if possible and I will endeavour to give what advice is asked.

The leaf of Carnation is badly diseased with rust, a fungous disease that is rather difficult to subdue. Bordeaux mixture is the best remedy for this but judging by the condition of sample I think you had better burn the plants and in the future buy plants that are grown in New Brunswick. Many states of the union and most of the Upper Provinces of Canada all have this disease but so far New Brunswick is free from it, except in cases of imported plants, which a reliable florist will not sell until thoroughly cleaned. Don't buy rusty Carnations. The disease is mostly all stamped out.

The little white worms in soil may be destroyed by the use of lime water made as follows:—Take a piece of quick lime about the size of a hen's egg, dissolve it in a pint of water and thoroughly soak the ball of roots with it in water two or three mornings. The worms will be expelled into the saucer and can be destroyed. After the worms are all driven out throughly water with clean water.

The white flourlike substance on the rose leaf is mildew caused by a sudden chill or exposure to a cold fog or the lowering of the vitality caused by want of repotting. A powdering of fine sulphur on the foliage will prevent and destroy this disease but you will probably lose the foliage effect, especially in the instance mentioned. Try and keep an even, moist temperature and have the soil moist.

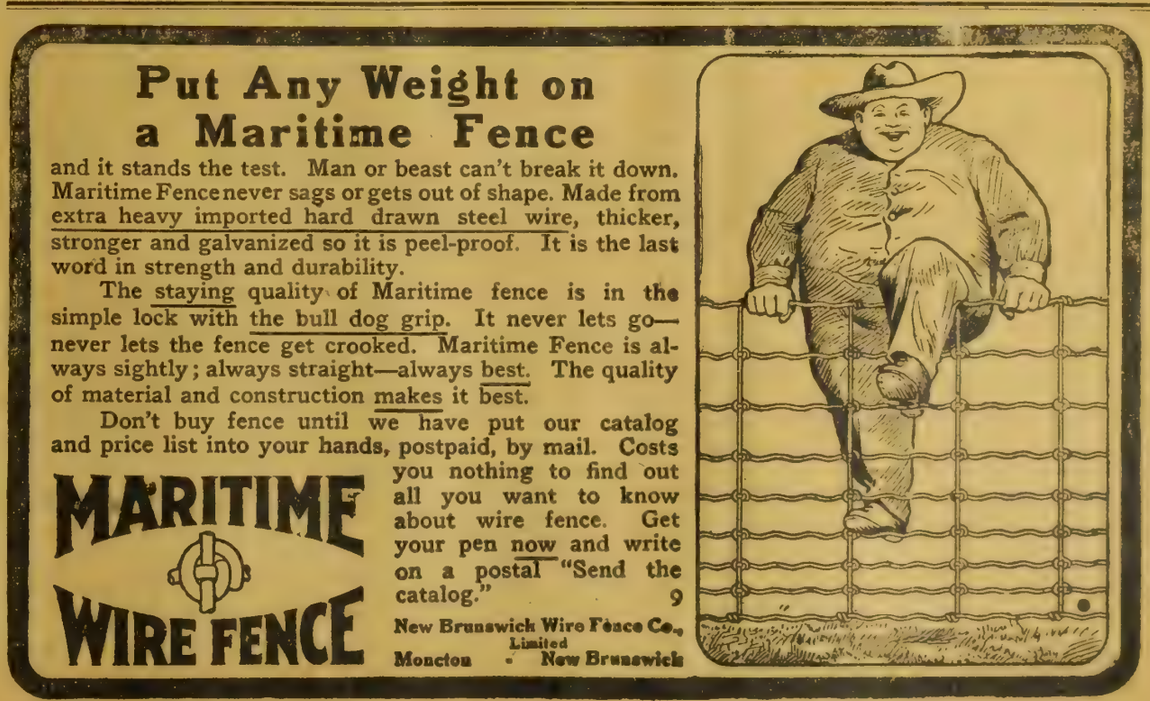
For your garden annuals get Drummond Phlox, Verbenas, Asters, Stocks and Mignonette. These are inexpensive, hardy and the more flowers cut the more profusely will they bloom.

Lubrication of Farm Machinery.

One of the little things that is lacking on a majority of farm implements is a good and convenient system of lubrication. The common oil cup with open top or loose cap is sure to get filled with dirt and grit which cut out the bearings, largely increasing the power required to operate the machine and greatly reducing its period of usefulness.

The hard oil cup, which holds enough oil to last a week or more, is always tight and can be screwed down a little each day, thus insuring a clean bearing and a regular supply of grease. Many of the common implements could be vastly improved by replacing the common oil holes with hard oil cups.

The oil holes can be easily reamed out and threaded to the proper standard and the hard oil cups screwed into them. The amount of work and expense required with be returned many fold in the saving of horse flesh and in the increased life of the machinery.—Jerome B. Frisbee.



One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

FOR SALE.—Two pure bred Holstein Bull Calves. Right milking stock. Apply to A. W. MORROW, North Lake, P. E. I.

W. C. McLEOD & SONS,
Loch Lomond West Nova Scotia

Schedule of Sheep Extension Car.

For a number of years the Maritime Province Departments of Agriculture as well as the Dominion Department have been trying to stimulate an interest in the sheep raising industry by holding auction sales of pure bred stock. Institute meetings have also been held at which some of the best Canadian authorities on sheep husbandry were the speakers.

In this way a great deal of interest was aroused. The scrub sire has been eliminated in many sections and the use of pure bred sires has been substituted instead, much to the improvement of the various flocks.

There is, however, much room for improvement. Alive to this fact, the Dominion Department appointed Mr. J. A. Telfer, a noted authority on sheep husbandry, to take charge of the extension of the sheep industry in the Maritime Provinces. During the winter months he made himself useful to the local sheep breeders by attending the Winter Fairs and Short Courses where he conducted sheep and wool judging classes and by giving timely advice at meetings held throughout the length and breadth of the land.

During the last month or so Mr. Telfer has been in charge of a sheep extension car and he has been touring the provinces going over the various lines of railway. Stops were made at the mast important farming centres where the car was open for inspection and where Mr. Telfer gave talks and demonstrations along sheep husbandry lines. Several sheep of the representative breeds are carried, as are also a modern sheep dipping vat, samples of the various kinds of wool, a model sheep barn and many other articles of interest to sheep breeders.

Following is a schedule of dates for the next few weeks. It will pay each and every one of our readers to take a day off and visit the car when it is in their vicinity:—

*Tuesday, June 24th, ar. Chatham, 14.30

Wednesday, June 25th, lv. Chatham 5.20.

*Wednesday, June 25th, ar. Doaktown, 10:07.

Thursday, June 26th, Lv. Doaktown, 10:07.

*Thursday, June 26th, Ar. Fredericton, 16.00.

Saturday, June 28th, Lv. Fredericton, 7:30 a. m.

*Saturday, June 28th, Ar. Woodstock, 10:45 a. m.

Monday, June 30th, Lv. Woodstock, 11:01 a. m.

*Monday, June 30th, Ar. Florenceville, 12:21 m.

Tuesday, July 1st, Lv. Florenceville, 12:21 m.

*Tuesday, July 1st, Ar. Andover, 1:30 p. m.

Wednesday, 2nd, Lv. Andover, 2:30 p. m.

*Wednesday, July 2nd, Ar. St. Stephen, 9:00 p. m.

Friday, July 4th, Lv. St. Stephen, 6:45 a. m.

Friday, July 4th, Ar. St. John, 11:00 a. m.

Car open only at points marked by *.

The Pictou Exhibition.

The Pictou Agricultural Society, of Pictou, N. S., will hold their annual exhibition on their spacious grounds in the town of Pictou on September 29th, 30th and October 1st. Competition open to the county of Pictou. We have received a copy of their attractive prize list. Substantial cash prizes are offered in the various departments and each and every farmer in the good old county of Pictou should send for a copy and plan to make an exhibit in one or more departments. Entries close on September 23rd.

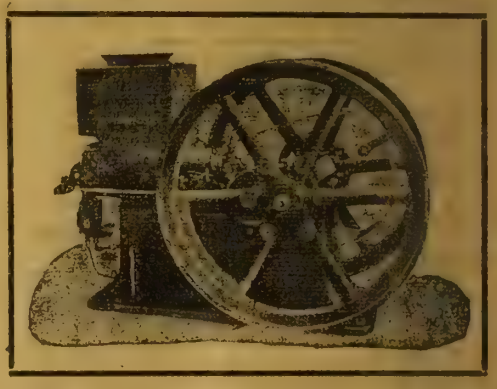
USE THIS COUPON NOW

Plan Now To Own This Summer Our "Monarch" Engine --The Very Best Value Money Can Buy.



WE want you to select for your farm a "Monarch" Engine, and the reason why we offer it to you is that we have made it for you as though you had a big engineering staff waiting to test it severely.

We don't make "cheap" engines. The "Monarch" is a farm engine, but made as carefully as an automobile engine in every part. We put into the "Monarch" extra large parts, a carbon-steel piston rod, adjustable bearings, timing and safety devices—qualities and fittings not found in "cheap" engines.

These fittings and materials cost money, and we have to charge you for them, when you buy a "Monarch." But, really, in the end, these devices and the quality-material save you a great deal of money for fuel, a great deal of inconvenience and time, and reduce the chance of breakages to the very lowest point. In addition to this, a "Monarch" will last over a longer period of years on your farm—it costs you less per year than any ordinary farm engine. It costs you less for fuel.

The farm engine is a good thing. Even the poorest of them pays its way in making the farmer less of a slave and drudge. But a perfectly designed farm engiue, well made in good material, such as the "Monarch" is the greatest boon in the world for a farm.

In a "Monarch," due to its design, you get these very important things—all these things together in the one "Monarch" purchase—1-4 to 1-2 fuel cost saved over 15 to 20 years; easy starting at all temperatures; great variation in power; easy change of speed; easy shifting or moving without breakage; easy take-up of wear "Monarchs" give more power than their rating.

We want you to investigate a "Monarch" Engine. We will send our "red circle" folder showing its parts, part by part. Within 2 years the "Monarch" constantly used will have saved its cost by reduced fuel bills. You can get Monarch Engines in sizes from 1 1-2 horse power up to 35 horse power, ready for farm service.

Frost & Wood Binders

REDUCE Harvest Wages-INCREASE Harvest Profits

THIS is the time to make a decision on a binder. The one binder to consider is the famous Frost & Wood. Behind this binder are 75 years of experience in farm implement building.

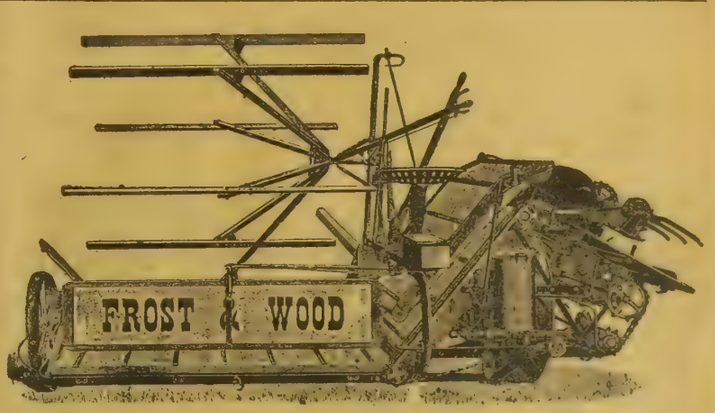
We claim that the Frost & Wood is one of the very best machines a farmer can use, especially if he depends on a single team. The reason is that the "eccentric sprocket" device on the knotter shaft uses the team's strength economically. The extra power needed for tieing the bundle and ejecting it is obtained by leverage, and not by the direct draft of an ordinary binder.

With a Frost & Wood there is no "chug" and slowing down at each sheaf. The horses pull steadily at even speed. In a day's work, a Frost & Wood Binder covers much more ground. The gain is especially great during the afternoon, giving a full day's drying-out to the stooked sheaves. This saves a day or more on each field—saves time, saves harvest wages, saves possible damage from wet weather.

The Frost & Wood Binder has roller bearings throughout. The frame is stiffened and braced at every corner. This means that the light draft of the binder from roller bearings cannot be destroyed by sagging of the frame and twisting of shafts out of line.

Besides saving your Harvest cost, Frost & Wood Binders increase your net profits. Grain does not "thresh" either in the elevator or on the deck. Your wheat, oats or barley all get into the sheaf, and from the sheaf to your barn.

Grain scattered on your field is a serious loss in cash. The Frost & Wood quickly pays for itself by the savings it makes on your farm. Save harvest wages. Save all your crop for your granary. Do it with a Frost & Wood Binder.



SEE a complete description of the Frost & Wood Binder in our illustrated Frost & Wood Farm Implement Book. This binder merits a careful examination and a comparison after examination with any other binder. It will cut quicker, bind better, and wear longer than any ordinary machine. Get this book from us today.

Write us for Catalogue or see the Frost & Wood Agent about any Farm Implement you need, especially if you seek years of perfect service in your machinery.

Dustman's Book of Plans *and* Building Construction

By U. M. DUSTMAN, (*Licensed Architect*)

10,000 Sold in 30 Days **Price $2.00 Prepaid**

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an authority on the construction of medium priced homes.

Everyone interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns. farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS : General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying out a building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required —Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables - Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions For Mixing and Placing Concrete - Proportions—Sand and Gravel —Itamized List of Material Costs—Writing of Specifications.

This book will be sent, together with a year's subscription to THE MARITIME FARMER to any person upon receipt of $2.00. That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscription. If you are not already a subscriber and want the book, you may obtain it and THE MARITIME FARMER for $2.00 These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.

Make Your Coal Oil Lamp Your Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

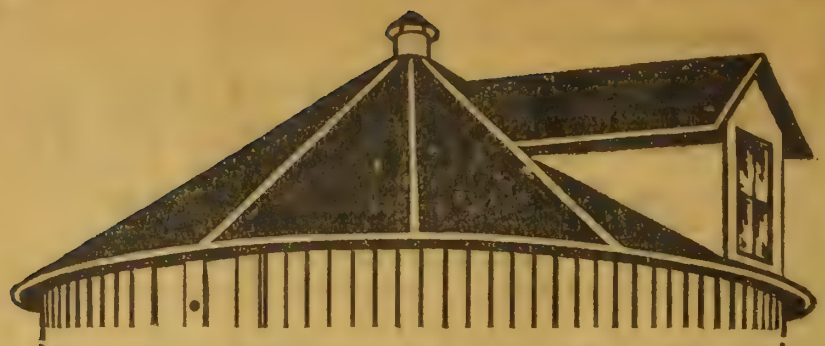
Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. S nd to-day.

We guarantee these burners to do as represented or money refunded.

The Maritime Farmer
SUSSEX, N. B.

We do not sell these burners but each subscriber may get two beside one we furnish free by sending 35 cents for each additional one wanted.



You won't be a "lucky" dairymen till you get an IDEAL GREEN FEED SILO

The "lucky" dairyman is the man who takes advantage of every opportunity to increase his milk or cream production without increasing his feeding cost, and who leaves no stone unturned to make every cow he owns produce the last cent of possible profit.

That's the kind of "lucky" cow owners you'll find with Ideal Green Feed Silos on their farms. They know that a good silo pays for itself the first year and after that it is all clear profit.

If you don't know why send for our free Silo Book which contains much valuable information about the erection of silos and the advantages of silage.

Selecting a Show Herd of Beef Cattle

By W. A. McHenry, in Breeder's Gazette

A SHOWMAN'S success depends primarily upon the type of his cattle. No amount of skill in fitting and showing will compensate for marked deficiencis in conformation or breed type. Necessarily one must know just the sort of cattle which the most experienced and respected judges prefer. Although individual judges have little preferences of their own, there is a general pattern for each breed which is very closely followed by all of them. This pattern shapes itself gradually as time goes on, according to commercial market demands for beef cattle, as breeders aim constantly to produce such cattle as will most economically and surely fulfill market requirements.

It is something of an art to pick out thin cattle which will develop into the correct show type when fitted. One must know by experience about how an animal fills out with the addition of fat. It is most essential to have cattle of good lines, straight and level in the back and also in the underline, standing on short legs that are wide apart. The general build should be blocky and wide. It is especially necessary to have great depth of chest and flank and width between fore legs. There must also be full thighs, extending well downward toward the gambrels, and a low twist. The shoulders, back and hips, even in thin animals, should carry an appreciable covering of flesh, indicating a wealth of lean meat which is a necessary foundation on which to build a show carcass. To go with this general conformation there should be a fine wide intelligent-looking head set on a short neck, which should taper gradually from the head into a smooth junction with the shoulder.

One should especially avoid cattle that are long-necked and narrow in build, having a long slender head and neck. This kind of conformation is not associated with thick beef or great feeding capacity. Although any thin bull or cow gains an appearance of being lower set as it fattens, no amount of feed will bring the leggy, long-necked, slabsided animal into a low-set, wide shape. The long narrow head is especially undesirable as indicating a poor and restless feeder.

Some important indications of show calibre may be mentioned. Of course, the straight top lines and the general outlines prevailing in the breed are very necessary, and in beef cattle there should be the closest possible approach to the best commercial standard in the high-priced cuts of beef. There must be a vigorous constitution, and a disposition to be ready always for feed, as a thick, smooth finish cannot be put on an animal devoid of these qualifications. A soft pliable skin is another special essential. It is generally associated with good feeding capacity, and the ability to turn the feed into the right sort of meat. Animals with pliable skins will commonly put on considerably more finish. With all these fundamental characteristics the style of the prospective show animal must be given due consideration. A bull or cow which stands squarely on its feet with head up and eye and ear calm but alert attracts instant attention. A graceful prompt steady way of walking is also advantageous. Those little things do much to attract the attention of a judge, and convey the impression of the vitality and vigor which are essential in breeding animals.

The chief consideration in selecting a show herd is the bull. The one bull is necessarily considered against the four females that are shown with him. He must first of all be masculine and vigorous, and he should bear distinctly the characteristics which are peculiar to the breed. The female should be compactly built and low-set, and posses the good lines which are inseparable from show shape. She must also be breedy in character. Her most distinguished feature must be a pronounced freedom from coarseness of any kind. There should be no suggestion about her shoulder, neck or head of the stronger outlines which characterize the bull. While the bull may look aggressive, the cow should look peaceful and gentle.

Throughout the show herd there must be the greatest possible degree of uniformity in breed type and in general beef conformation. It is folly to put cattle of different shapes into a show herd, even though individually they may be very excellent animals. Slight variations in conformation which would be scarcely noticeable when the animals are inspected separately may look very pronounced when they stand side by side in the show ring.

Selections for the show herd should be made as early as possible. It has been my custom to breed the cows so that the calves would be dropped at as early a date as permissible, so that they would have the benefit of age. When bred in this manner one has the advantage of age in the calf, yearling and two-year-old, and the extra months contribute to thickness of flesh and size. Early calving allows more time for fitting the aged animals in the herd. After the calves are dropped as early as possible one should carry them along rapidly from the time they are born until the end of the show season. The same is true of the cows. They should be pushed right along so as to keep gaining in flesh, and one must be very careful not to let them down in that particular or to cut down their feed. If they go down in flesh at any time in the season it is impossible to make up the time that is lost.

The longer the time that may be taken in putting on the desired flesh the thicker and smoother it will be at the end. Very heavy feeding for a short period to make up for lost time is apt to derange the animal's digestion and also to put on rough flesh. As to the time required for fitting the same rule applies to the young herd as to the aged herd. The youngsters should be carried along from the time of calving to the end of the show season without allowing them to go backward in flesh or condition. The calves also must be pushed right from the start. They require all the time that one can give them from the day they are born until the time they are shown. Each week and each month makes it possible to have them carrying more flesh andbloom, and to show more plainly their evidences of correct beef form.

Roots and green feed can be used to great advantage to keep the animal's stomach in good condition on heavy feed. The feed of show animals must be a mixed one, covering the different ingredients. These should be mixed in separate proportions, so that the cattle will not put on too much flesh, but will be carried along with a steady growth, giving plenty of bone, especially in the young animals, and at the same time putting on flesh evenly. Bone-making and muscle-making feeds must be used in abundance. A common mixture of grain feeds which gives good results is made of equal parts by measure of ground corn, crushed oats and bran, with the addition of a small amount of oilmeal toward the last of the season. Clover and alfalfa hay are the best kinds of roughage, and the run of the pasture at night in the summer is a great advantage both for the green feed supplied and for the exercise.

An effort must be made to keep the members of the herd gaining uniformly and developing alike in their degree of flesh and finish. A great deal depends upon the feeder. If he has been educated to a nicety he will know just what his animals will take, and will not give them more than they will clean up. Regularity in feeding is an essential. Feeders should be given plenty of time if they are expected to get their animals in high flesh and pleasing form for the show ring. Some exhibitors seem to think that a few weeks' preparation, or a few months, will suffice to fit animals that can win, but they find their mistake. It takes time to get a first-class show heard ready,, and it requires skill on the part of the herdsman to carry over animals from year to year and yet preserve fecundity and bloom, but it can be done. It is possible to injure breeding cattle by long-continued high feeding, and it is the real "artist" among herdsmen who carries them on without injury.

Editor's Note:—There was a time when a great number of fat cattle were grown in and exported from the Maritime Provinces. The rapid increase in the population of our cities and towns furnishes a ready market for all the beef that is produced locally and thousands of dollars are annually sent to Ontario and other Western packers for meats of various kinds to fill the demand. Stall feeding is not carried on so extensively in the Maritime Provinces as in years gone by. The older generation of farmers have nearly all passed away and their sons have not followed in their footsteps in the matter of beef raising as mush as they might. In sections where there is abundant pasturage and where large quantities of hay, roots and grain are grown, instead of selling the raw material a remunerative business can be conducted in the growing of beef cattle and thus capturing a portion of the money that would otherwise go to build up the industry in another province. Our exhibitions are doing a good work in demonstrating the correct types for our farmers to raise. We would also advise our young readers to further study beef type by taking a course at the N. S. A. C. and then instead of leaving the farms to work in the cities remain at home and share in the wave of prosperity that comes to the farmer who grows the commodities that our markets demand.

Nova Scotia Farmers Visit the N.S.A.C.

VALLEY FARMERS.

On Friday, June 27th, the farming hamlets bordering on the Dominion Atlantic Railway, in the counties of Annapolis, Kings and Hants were early astir. The sturdy farmers of the far famed valley were wending their way, despite the unpleasant elements to the railway stations where they entrained to the tune of thirteen carloads for a visit to the Nova Scotia Agricultural College at Truro, an institution to which a great many of them have learned to look for guidance in solving the perplexing problems with which they are daily confronted.

By the time the excursionists had arrived in Truro the weather man had changed his mood and was dealing out a pleasant brand of weather.

At the Agricultural College, they were heartily welcomed by Principal Cumming and his staff and invited to thoroughly inspect every portion of the vast establishment. With its many buildings and three hundred acres the farm is in splendid shape and in its present condition suggests an estate that any nobleman might be proud to look over. Its broad fields are tilled to the best advantage and in appearance its stock certainly does not betray any indication of the fuss that was made over their health during the past winter.

WELCOMED THE VISITORS.

Soon after the legion of excursionists had found their bearings and been served with tea or coffee to go with their lunches, for it was, in a sense, a basket picnic, the pleasing strains of music from the town Citizens' Band gathered them into the large pavilion where was carried out the only formal programme of the day.

Principal Cumming welcomed his guests in a pleasing speech touching on subjects of public importanre. Naturally the subject of cattle tuberculosis was ventilated to some extent. The Principal, invited the visitors' inspection of every head on the farm. The farm people were not a bit sensitive, he said, on this point and courted the fullest investigation. He challenged any, on general appearance, to separate the animals that had reacted to the tuberculin test, from those that showed absolute freedom from the disease when tested. He outlined the practice of segregation in vogue at the farm and pointed out its results in the offspring of animals that had reacted being entirely free of tuberculosis when submitted to several tests. That subject was a much discussed one was apparent from the many questions that followed the Principal's address.

Mayor George W. Stuart was present and tendered the visitors an address on behalf of the citizens of Truro. The speech of his Worship was heartily applauded by the immense throng and their thanks was returned by Prof. Saxby Blair, of Kentville, who made a very interesting speech urging the farmers of the Province to greater co-operation in their work and the adoption of a system whereby they could reach out with more definite ideas that would increase the productiveness of their fields, enable them to maintain larger stock and tend to greater development along general lines. He paid an exceptionally high compliment to the College and its farm in the good work it was doing.

Other addresses were made by Mr. C. P. Blanchard and Prof. Landels. Then followed the parade of live stock consisting of Holsteins, Ayr shire and Shorthorn cattle and Clydesdale Hackney and Thoroughbred horses. About the only animal on the farm not in the show was Achille 2.15¼, the trotting stallion, and he is recuperating from a temporary lay-up following an attempt to wreck his vengeance on Royal Baron, the huge Clydesdale stallion, for being larger than he was. This encounter took place over a nine foot board fence, so neither horse is badly injured notwithstanding.

The display was a fine one and as one Hants County farmer, who has all the Provincial Exhibitions and a Truro exhibition held as far back as 1876 said he "never saw a better one." Many of the visitors found time to visit the dairy department, where Mr. Mackay dispensed not only buttermilk, but information as to the finer art in butter and cheese making; also Prof. Matheson in the Horticultural building who talked on insect pests and fungus growths of trees which was of particular interest to the orchard men, and over on the Hill, Prof. Landry was "at home" at his well equipped poultry department where innumerable chicks and other splendid poultry are housed.

Others visited the fields and were pleased with the well advanced crops. The train for home left at six o'clock making the afternoon all too short and the excursionists started for home regretting that time did not permit them staying longer at this interesting public institution.

PICTOU COUNTY FARMERS.

Under more favorable weather conditions than the Kings county farmers experienced on Friday, a large party of Pictou county farmers took an outing at the provincial farm on Saturday, June 28th.

In the absence of Mayor Stuart, his deputy, T. Starr Pattillo, welcomed the visitors on behalf of the town of Truro and took occasion to comment upon the good work being done by the agricultural college and the appearance of the farm on behalf of the visitors. The reply was made by Howard Kennedy, of Alma, who also endorsed the laudatory remarks of the deputy mayor as respecting the institution and farm and thanked Truro, and the college officials for the splendid reception given them. Principal Cumming was indefatigable in his efforts to have the visit a pleasant one and wished that the closest scrutiny be made of the farm, its stock and equipment. The fine day gave the visitors the fullest opportunity to do this, and many good words were heard as a result. The crowd was too large to be accomodated in the pavilion, so the parade of animals was made in an outdoor ring. In addition to the college stock, some from C. P. Blanchard's famous Purebred Ayrshire herd was also shown and pleased the crowd. It was a most successful picnic throughout. The ten cars of people left for their homes at five o'clock, well satisfied with the day's enjoyment, and much benefited by what they had seen.

First Annual Meeting of the United Fruit Co's. Ltd

The first annual meeting of United Fruit companies of Nova Scotia opened at Berwick, N. S. on July 2nd and 3rd. One hundred and twenty delegates were present. President John Donaldson, of Port Williams, gave the opening address. His opening sentences were:—"This is the first time we have met together since we have been legally incorporated as the United Fruit companies. It is also the first year that the subsidiary companies, throwing aside their prejudice, giving up their own individual ambitions and sinking all minor differences, voluntarily agreed to unite together, work together under one management, and pool all products in common fund. To have done this so quietly and thus to have achieved so quickly the results of real co-operation, has not only astonished the world, but also ourselves, for we can scarcely understand what a power and what an influence we can now exert in the business and commercial world. What it has taken other countries and other organizations years of work and thought to accomplish has been done by the fruit growers of the Annapolis Valley in one year.

The president claimed that the chief objects of the organization were first, more money for apples; second, cheaper supplies. At the same time he pointed out that true business was based on mutual advantage. A pleased customer was the best advertisement and it was necessary for fruit growers to keep high their standard pack. Mr. Donaldson said he was proud of the results of the management during the past season of 1912-1913, and was not afraid to compare prices with any individual outside the co-operative associations.

He submitted the following problems:—First the necessity of the more rapid packing and shipping of early varieties, cold storage; secondly, the advisability of box packing; thirdly, the need for more expert knowledge in the barrel packing and the imposing of a penalty for careless packing; fourthly, is it advisable to raise the standard for number threes and thus pack less; fifthly, disposition of culls, establishment of evaporators and vinegar factories; sixthly, the best mode of managing subsidiary companies.

The report was given into the hands of a committee.

A. E. Adams, executive secretary, read the annual report and presented the financial statement. Much discussion arose over the report. There were criticisms of salaries paid officials, but discussion brought out satisfactory details, and the report was finally adopted with an enthusiastic and unanimous vote.

The evening session was given up to addresses on co-operative centralization by A. McNeil, chief of the division, Ottawa, and Professor Cumming, principal of the agricultural college, Truro. Mr. Blair paid a glowing tribute to the success attained by the co-operative fruit growers of Nova Scotia.

The annual report was presented by A. E. Adams, executive secretary. It was a lengthy and exhaustive document worthy of what is classed in bulletin 38 of the department of agriculture as "the best example we have in Canada of a central selling association."

The report called attention to the difficulties of the initial year of the central association and said: "While much good work has been accomplished and very large savings have been affected, yet the critical eye of your management has detected that certain parts of the machine could give even better results and accomplish much larger savings, and it is their intention before the second year's business commences to have the machine perfected in those parts."

There are thirty-two companies holding stock in the United Fruit companies of Nova Scotia, and the total expenses of the central have only amounted to $12,000, or three cents per barrel on the fruit handled. The report claimed that there is absolutely no comparison between the expenses of your central and that of any other, similar but smaller, institutions throughout the North American continent."

AVERAGE PRICES PAID FOR STANDARD VARIETIES.

A detailed statement of the average prices obtained for standard varieties was given and the low prices obtained during the past year was accounted for "by the fact that throughout North America there was a tremendous crop, every apple producing section with one exception claiming a rerord crop of good, clean fruit. The one exception was Nova Scotia, which was not only an exception because it had only an average crop, but was also an exception because even that was dirty."

The management had realized at the outset that it had encountered the "very worst year possible in which to make a start. The word going on to the world's markets that Nova Scotia had spotted fruit and every other country a bountiful supply of good, clean fruit, was sufficient to discount Nova Scotia's prices for the entire season."

The report called the large quantities of No. 3's a most deplorable feature. Instances were given of the keen competition and the necessity there was of keeping the closest watch on all the markets.

Brief reference was made to the work of S. B. Chute, general manager; A. E. McMahon, inspector; J. N. Chute, European representative, and Captain C. O. Allen, shipping inspector.

OPPOSITION AGAINST CO-OPERATIVES.

The Canadian Northwest trade was referred to as an important factor in the prices of Gravensteins, and in this connection an instance is given of the fight being made against the co-operatives:

"T. H. Morse had sold some 16,000 barrels of Gravensteins in Winnipeg and beyond at $2.25 per barrel, 1's and 2's. They were selling readily and he could have easily disposed of our entire crop at these figures. Certain firms of speculators, however, started to quote Gravensteins at $1.50 and $1.60 per barrel, and an absolute panic in the western market ensued. In order to retain what orders were not cancelled we had to reduce our price to $2.00 and it effectually stopped the sale of any more. The only thing that made it possible for the speculator to do this work was the fact that there were so many farmers outside the companies who, not having the benefits of co-operative organization, were glad to sell their Gravensteins to those speculators packed at $1.25 per barrel for No. 1's and 2's. These unorganized farmers

cost the United Fruit companies at least $5,000,00 on Gravensteins alone."

The work of Mr. Morse in the west was highly spoken of:—"In addition to having some splendid sales he established business relatings for us which form a most valuable asset, and on which we are relying to do a very large business during the coming season."

The successful extension of the home markets by the companies' representative, M. K. Ells, was dealt with at length, and one instance is given:

"A large firm in New Brunswick who bought 8,000 barrels from us last year have contracted to take their entire supplies, estimated at about 30,000 barrels, next season from the United Fruit companies, guaranteeing a minimum of 16,000 barrels and agreeing to handle no others. That is just one demonstration of what can be done by putting up a good, reliable, honest, uniform pack of apples."

THE LONDON OFFICE.

The work accomplished by the London office was left for a special report by the European representative, J. N. Chute. There were shipped to Europe last season by the United Fruit companies 303,442 barrels, and the annual report gives details of the savings effected and the improvements that had been obtained in shipping facilities.

The subsidiary companies were urged to take fuller advantage of the information obtained by the central, and it was shown that when the instructions of the central were followed in regard to shipping the average price was invariably and substantially increased.

Regarding purchases the report said in part:

"The purchase and distribution of supplies forms a large part of the work of the central association, and in this connection not only the members of the associated companies, but farmers generally, are indebted to the central for very large savings.

We have handled 5,975 tons of fertilizer this season, or 307 carloads, and have saved our members on an average of $3.00 per ton on wholesale price, or in round figures $18,000.00."

The list of supplies purchased was given in detail and makes up a total of $153,000.00 "all of which has been paid, spot cash."

The re-election of practically all of those in charge of the affairs of the United Fruit Companies was the tribute given to the administration by the assembled delegates. John Donaldson, of Port Williams, was re-elected president and M. B. Davis, of Bridgetown, re-elected recording secretary. The directors elected by each company, and from whom the board of management was chosen, is now made up as follows:

Middleton Fruit Company—A. P. Dodge.

S. B. Chute Fruit Company, Berwick—S. B. Chute.

Central Fruit Company, Clarence—A. P. Ramsey.

Granville Fruit Company—G. I. Salter.

Aylesford Fruit Company—A. E. McMahon.

Port Williams Fruit Company— J. Elliott Smith.

Kingsport Fruit Company— H. R. Kinsman.

Round Hill Fruit Company— F. E. Mason.

Bridgetown Fruit Company—Geo. Chute. 7

Blomidon Fruit Company—J. D. Beqnett.

New Minas Fruit Company— E. H. Johnson.

Star Fruit Company, Paradise—Arthur T. Morse. K

Banner Fruit Company, Bridgetown—F. H. Johnson.

Falmouth Fruit Company— B. S. Davison.

Kentville Fruit Company—Captain C. O. Allen.

Sheffield Fruit Company— J. E. Taylor.

Canard Fruit Company—Captain Haliburton.

Kingston Fruit Company—F. W. Foster.

Berwick Fruit Company— B. W. White.

Rockland Fruit Company—G. P. Raymond.

Pleasant Valley Fruit Company—T. H. Morse.

THE WORK OF THE AGENT IN LONDON.

John N. Chute presented the report of his work in London. He gave in detail the work done. He had apples consigned direct to the London office, had secured the best commission men to handle the fruit, had arranged to have all United Fruit Company apples sold at one rostrum in Floral hall, had arranged for the carting at a lower rate than before, had overseen the discharging of practically every steamer and showed that the commission men had been kept up to the highest prices possible.

Mr. Chute explained the workings of the three organizations, the brokers, the importers and the buyers, all of which have been exacting tribute from the Nova Scatia fruit growerns. These three organizations have control in Liverpool and do not look with favor upon the co-operative movement which is already seriously interfering with their profits, and which will make a still further inroad on these profits the coming season. He summed up what was essential to be accomplished on this side in order to help out the marketing of apples in England:

1. Good clean apples. Our people must use greater effort to produce clean fruit. The man who neglects to spray must not expect to put the results of his bad management on the shoulders of other people. No system of marketing, either co-operative, or otherwise, can make up for a lack of common sense in growing fruit.

2. Better system of packing.

3. Fruit free from bruises.

4. We need to complete our organization by uniting all the fruit growers of Nova Scotia, and under no consideration should individual companies market their own fruit, because the best results can only be obtained by keeping our interests entirely united.

A. E. McMahon, inspector, told in his report of the difficulties of a season when there was so much bad fruit. He said he had had the hearty co-operation of the various managers in the effort to produce a specific United Fruit Companies pack that was superior to the government standard. The result was that now there was a growing demand for United Fruit Companies apples. His report was enthusiastically received.

At the afternoon session Captain C. O. Allen, who has charge of the shipments from Halifax, reported calling attention to the increased speed made by steamers by steamers from Halifax since the United Fruit Companies had been active in insisting on better service.

¶ See the Nova Scotia Agricultural College ad. in this issue. Young man now is the time to plan to take advantage of the opportunity offered by the college. We will have something to tell you about it in our next issue

Director of Elementary Agricultural Education for New Brunswick.

The New Brunswick Departments of Education and Agriculture have appointed Mr. R. P. Steeves, Inspector of Schools for Kings County, as Director of Elementary Agricultural Education. Mr. Steeves has always taken a deep interest in the question of agricultural education in the school. He is the author of a curriculum to use in this respect and is a firm believer in making any work carried on along these lines as practical as possible. Mr. Steeves went in harness in his new position on July 1st.

Beginning with school gardens the new director hopes to institute a series of farm competitions along the lines of the corn clubs of the south with the object of increasing the efficiency of different kinds of crops.

If a certain kind of corn produces several bushels more to the acre as a result of the competition it can easily be seen how much the province will benefit.

The new director met Dr. W. S. Carter, chief superintendent of education, and Rev. J. B. Daggett, secretary for agriculture recently and one of the chief matters considered was the training of teachers for agricultural work in the schools.

To provide for this, Mr. Steeves is sending a limited number of teachers to the Rural Science School at the Nova Scotia Agricultural College, which opens on July 8 and continues until August 10. The teachers who are chosen from the applicants will have their transportation expenses paid and will also get a grant of $15 towards their other expenses in case they take the full course, devote their whole time to the work, pass the examinations and take up the practical school gardening and agricultural work during the first term.

Boards of trustees which introduce school gardening as a portion of the school work will receive encouragement in the way of financial assistance to a certain extent under regulations to be framed and the intention is to have the work done practically with the school garden as a piece of apparatus used in the general educational work of the schools.

Competition in plots, first at school and then extending to the children's own farm homes will be instituted and prizes offered for the best results. These will be awarded according to counties and regulations will be framed with the object of extending as far as possible the line of study besides the importance from an economic standpoint of improving farm crops.

Assistance will be given for the maintenance and equipment of school gardens so that the teaching may be the most practical form. Teachers who have taken a full or partial course in school gardening or nature study work who wish to take up the work in the schools next term or trustees wishing to obtain such teachers would do well to apply to the directors at once.

The department is also very desirous that Arbor Day and its object of improving the condition of school grounds should become a more satisfactory element in country school life and competitions will be instituted with this end in view.

Encouragement is also to be given to the elementary domestic science in the schools of the province and it is hoped that many country schools will avail themselves of the opportunities in this respect.

The director is available either by letter or personally at Sussex, where his office is located at present, and will be glad to give teachers, trustees and others interested every assistance.

A Farm Scene Photo Competition.

The department of Agriculture is preparing a fine line of literature, to be published in pamphlet form, describing New Brunswick's opportunities. This literature is being mailed to almost every part of the world, in answer to the many enquiries which they are receiving for prospective settlers.

They are desirous of obtaining for these publications a number of photographs, and are offering the following generous prizes for the best twelve (12) photographs of farm or country scenes in New Brunswick:—

1st prize, ... $20.00
2nd prize, ... $10.00
3rd prize, ... $5.00

This is a splendid opportunity for those who are interested in photography to make a little easy money.

The Department should have a very generous response.

The Competition will close August 1st. For further particulars, write Mr. J. B. Daggett, Secretary for Agriculture, Fredericton, N. B.

SPECIAL PRIZE.

In the event of a competitor sending in less than one dozen scenes, which may be of exceptional value and acceptable to the Department, the sum of $1.00 will be paid for each such photograph.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; 3 inches—First insertion $2.25.

Contract rates on application.

WRONG FIGURING.

Not long since, in conversation with a prosperous farmer, he told us that the past year had not been a very prosperous one for him. After figuring up all his expenses he said he was only about $500 ahead, which left him with just a hired man's wages as manager of the property. He thought that was not enpugh and we agreed with him. But on inquiry we found that he had spent for machinery, fencing, tiling, and buildings about $2,000. All these items should have been charged to permanent improvements and added to the capital invested and not reckoned as running expenses.

He had just so much more invested in the farm, all of which the farm had earned as a surplus. He had it in property if not in clean cash, but it must have been in clean cash at some time during the year, else he could not have spent it that way.

We saw his face brighten up as we talked and then he said: "I wish that when I was young I had made a good study of keeping accounts. If I had, I would have seen that I was ahead of the game all that I had put into these permanent improvements." It looks simple enough when you see it, but we have known merchants as well as farmers do some wrong figuring.

We think the mistake comes from a lack of clear definition in the mind. If a farmer increases his property holding, by adding to the value of the farm, he has increased his wealth, either in the selling value of the farm or by increasing its ability to bring additional revenue. A farmer buys a valuable bull and secures from him a lot of heifers that can earn, say, 30 to 50 per cent more in milk than their mothers. In addition, they inherit from their sire valuable qualities which, when they are bred to another good sire, bring still better cows. All this dates back to the original investment in the first sire as a permanent improvement, an insrease in the working capital of the farm. And yet we have seen farmers who looked upon such an outlay as so much money spent for nothing.

Our friend, in his wish that he had studied bookkeeping, was right, for that study would have shown him how to define property and where to place it; how to correctly estimate it. To have the right thought about farm matters is the first step towards doing the right thing. We ought all of us to be more willing to lend money to the old farm for its improvement in money earning power. In doing so we add to our wealth just as certainly, and indeed more so than as if we deposited the same money in a bank or bought a mortgage with it. Money is well invested that increases the efficiency of the farm as a business proposition.

A farmer once saw us spreading phosphate on a clover field. "How long do you have to wait belore you get anything back from that stuff?" he asked. "Well, in two or three years," was our reply. "That's too long for me," was his answer. Then we asked him how long he had to wait for returns when he planted an apple tree, raised a colt or calf? "Oh, that's another thing" he remarked. Yes, it was another thing, another place to exercise the same old place which says: "Except ye sow, ye shall not reap."

THE BULL CALF.

On many dairy farms the bull calf is not the most welcome accessory. He is too often looked upon as a poor asset because of the difficulty a small dairy farmer has in finding a ready market for him. Where there are only one or two individuals of this kind to sell, the breeder does not realize the possibilities that are immediately at his door. He does not appreciate the fact that whether he has one or 100 there is someone waiting for his surplus stock, someone who is willing to buy at his price if he really has the goods for sale.

The question naturally arises how to find the buyer. One may take his stock to market and there he may sell to the highest bidder or he may make his own market by advising the reading public of what he wishes to dispose. This can be done most economically and conveniently through advertising. There is no better, no more logical or economical system of bringing the buyer and seller together than through the printed advertisement. It matters not how far apart the two may be, the dairy paper carries the message from one to the other at a figure that is remarkably conservative when the full measure of the service is borne in mind.

The advertisement makes a valuable asset of that which would otherwise be a drug on the market; it turns to dollars, stock and commodities that find poor sales elsewhere; it is a help to the extensive breeder or to the man who is just starting on his career and to whom small obstacles seem difficult and forbidding.

The advertisement is the life of all types of trade and it is just as adaptable; just as suitable to the farmer as to any other business man.

PASTURE INSRANCE AGAINST DROUTH.

May and June is the time to guard against shortage of feed in pastures later in the season. The chanres are there may be no call for this extra feed but it is always best and safest to be prepared so that in case the demand does come the cattle need not suffer for lack of grass or its equivalent.

Experience is a dear teacher and if one is to profit by the misfortunes of previous seasons he will have plenty of corn, oats, peas or other feeds suitable for use in tiding over the barren pastures. It is surprising to see how much can be grown on a small tract of land where soiling crops are raised. A succession of plantings makes it possible to keep an abundance of feed on hand for any emergency. Some dairymen who are limited in the amount of land available have undertaken, successfully, the system of raising all their feed and depending upon the soiling crops to the exclusion of pasture. A few acres used right will be sufficient for a small siled herd.

Naturally the most economical and most popular form of summer feed is found in silage. Many farmers are putting in small silos for use during the summer. They are giving silage to their cows regardless of the condition of feed in the pasture. A small silo is preferable to the large one in this connection because it is easier to keep the silage in good condition where the surface is not so large. The entire top of the pile of silage should be fed off each day and unless the building is a small one there will be difficulty in preventing loss or decay. This is the reason that so many farmers are building small silos at the side of the large ones. The popularity of the silo has grown rapidly during the past few years and perhaps no one thing has been more instrumental in bringing this about than its adaptability to dry weather conditions in the summer time.

Soiling crops are excellent but silage is easier to feed and more convenient and economical to handle.

THE BEGINNING OF HAY MAKING.

"Farmer James has begun mowin'!" "Has he, though? When did he begin?" "Oh, he's been goin' at it. Got the best part of his big meadow down, and a rare crop, so they say." This is a specimen of the remarks we will soon hear, and we have heard them, by the way, every year, as long as we can remember—sometimes a bit earlier, sometimes rather later, but always when the farmer in the district who is the first to start haymaking begins his mowing. The novelty of the situation does not last long, of course, for the man who leads the way is quickly followed by his neighbors, and soon the rattle of one mowing machine is re-echoed by that of another, until the whole country-side is ding-dong at haymaking when the sun shines. The beginning of haymaking is one thing, the finish is another, and some farmers who made a start about a year ago saw the shorter days of the autumn drawing in before the last load was on the stack. We hope there is not going to be a repitition of this in the haytime soon commencing, and at the beginning there is not infrequently a halting between cutting the herbage when it is young and succulent, and while settled weather prevails, or waiting on while the grass continues to grow. We know also the farmer who begins by rule and never commences mowing until a certain date, no matter what the condition of crop and climate may be. Some seasons he comes out all right, but in others he does not, and we favour no hard and fast rules where the beginning of haymaking is concerned. Rather we would let two circumstances settle it—i. e., the condition of the herbage, for too early cutting may mean a lot of shrinkage under a broiling sunshine, and the climatic conditions, for we like to begin haymaking on a rising barometer.

MACHINERY IN THE HAYFIELD.

Agriculturists are said to be a conservative set of men, and they may be in some respects, but show a farmer a device by which he can save labour and reduce his expenses, and you may feel sure that if he has the necessary means he will not be slow in acquiring it. On the labour farms many years ago there were men who prided themselves on their pitching, and were proud when evening came, if by loading one more wagon of hay than usual they had created a record. The idea of a machine to take the place of these brawny-armed fellows would have been laughed to scorn, but now it is an everyday sight to see a pitching machine being drawn quickly along the rows loading the wagons at a pace that would have knocked the sturdiest pitchers out of time altogether. It is surprising how quickly hay can be loadged by means of one of these appliancess if the ground be fairly level and even, but on hilly and banky fields they are a great strain on the horses, and it is under these circumstances that the human pitcher still rules triumphant. Doubtless it is the man who has a lot of hay to get in who benefits most by machinery, and by the use of mechanical appliances he is able to dispense with a good deal of hand labour Two or three hundred acres of hay takes a lot ol harvesting, particularly if it has all to be done by hand, but as things are, the commodity most eagerly desired is suitable weather. We may get all sorts of mechanical appliances for haymaking, but sunshine and breeze are still indispensable for the making of good hay, and unless we are favored in this respect machines are uselesss, and we are as helpless as in the days prior to their introduction.

Fifty farmers, representing all sections of the province, formed a Farmers' Co-Operative Society in Saskatoon last week. The society's purpose is the purchase of binder twine and other agricultural supplies at the lowest possible cost, and to eliminate as far as possible, the profits of the middleman. Hon. W. C. Sutherland was elected president. The society speedily got into action, and accepted a manufacturer's tender for a large supply of binder-twine, of which there was a shortage last season. Tenders have also been called for coal, flour, barbed wire and other farm necessities. A word to the wise is sufficient.

Cleanliness and low temperatures are the two greatest essentials in the production of fine flavored and good keeping butter.

The man who feeds what he has raised on his own place, carefully husbands the manure and puts it back on to the land is the man who will buy his neighbor's farm in the future, while the man who hauls all he raises to the town is the man who, sonner or later, will sell his farm.

The use of Fertilizers.

In view of the fact that our population is increasing rapidly and out of all proportion to our farm production, it is very gratifying to note the interest and attention which the farmers are devoting to the problems of crop production. With our high land values and wages it must be apparent that intensive farming is essential. For example, there can be no doubt that fifteen tons of potatoes from one acre is more profitable than twenty tons from two acres. There is only half the land in use, plowing and harrowing can be done in half the time, half the seed is saved, and a large yield requires comparatively little more labor to harvest them than a small yield. To produce maxium crops the vital points for consideration are good drainage and thorough cultivation and liberal application of available plant foods. Lord Palmerston once said that the wealth of any nation might safely be estimated by the number of ships which are engaged in the fertilizer trade, but it must be remembered that the best returns from money invested in fertilizers can only be obtained by thorough cultivation, for while a high degree of intelligence is essential to the greatest success in farming, yet brain can never entirely take the place of brawn.

It is a significant fact that in general the farms of North America, although comparatively new, are decreasing in productiveness, while in Europe during the past century, the farms have not only maintained their yield, but their fruitfulness has been increased, it is estimated, by 100 per cent. In speaking of this increase the Minister of Agriculture for France writes: "As nearly as I can determine the relative importance of the different factors which caused this increase are as follows:

In intensive agriculture:
Increased use of manures and fertilizers, ... 50 per cent.
Better preparation of land 30 per cent
Seed selection ....20 per cent.

In extensive agriculture:
Effect of chemical fertilizers .... 70 per cent.
Better preparation of land 20 per cent
Seed selection .... 10 per cent.

No great measure of reform has ever been accomplished without having to overcome opposition, caused by unreasoning prejudice, and the use of chemical fertilizers has been no exception. It is still quite common to hear surh remarks as "Chemical Fertilicers are only stimulants and art like a whip to a tired horse," or "Chemical Fertilizers destroy the humus in the soi,," or "If you begin the use of these things you must continue it," etc., etc. Nitrogen, Potash and Phosphoric Acid, in ater soluble forms are always plant foods, and if applied intelligently can never fail to give a substantial benefit. One man in British Columbia applied Nitrate of Soda for potatoes on a swamp soil which already contained an abundance of Nitrogen and because no beneficial results were obtained, he says that after trying Chemical Fertilizers he is in a position to show that they are of no value. Many other farmers are using Muriate or Sulphur of Potash and Superphosphate or Basic Slag on their swamp and peat soils, with results that are truly marvellous. An analogy would be represented if the farmer were to try for himself a diet of water only, and then, when he failed to increase in weight, to declare that water is useless to the human system. As for humus, this will be greatly increased by the use of Chemical fertilizers where rotation is practised, as the abundant and vigorous crops produced will leave in the soil valuable residues which form the principal source of the humus of cultivated soils. The experienre of Sir John Lawes at the famous Rothamstead Experimental Farm in England, where Chemical Fertilizers alone have been used on certain plots for nearly fifty years prove conclusively that there is no danger of exhausting the humic matter of the soil. Prof. K. van Vriers of Gronigen, Holland, has also made careful tests for many years with the same result. In fact, the soils of Holland are very rich in humus, although three times as much Chemical Fertilizer is used per acre as in England, and many times as much as in America.

Another advantage in the use of these plant foods is the vast improvement in quality in vegetable and fruits, and the greatly enhanced feeding value in hay, grain a nd roots. Every farmer has seen hay which has very little feeding value. As illustrations, one or two cases may be cited. Mr. Brice, of North Saanich, found that his cows gave more milk of higher test when fed on hay grown with fertilizer. Mr. Rey, of Keatings, found that his mangels from the fertilized plot would keep in good condition till spring, while the others spoiled before the end of December. Mr. Northcate of Mission found that, not only was his yield of strawberries greatly increased, but he lost not a single crate from the fertilized plot, while a heavy percentage of his other berries was lost by spoiling in the Hundreds of similar instances might crates during the time of shipment. be given.

Many of the troubles with fruit trees may be overcome by feeding the trees. For example, "Baldwin Spot," which many people think is a fungus, is really a physiological trouble, and may be corsected by soil treatment. Several growers in B. C. have tried this and found that not a single tree so treated showed a trace of "Baldwin Spot" while the other trees were badly affected. Prof. Voorhees says: "In hundreds of orchards the lack of vigor in trees, and the poor, misshapen and tasteless fruit are almost entirely due to lack of available plant food. Trees must be well grown, for good fruit cannot be grown from poor trees, and when the trees are well grown they cannot produce large and continuous crops of fruit without an abundance of food, even on the best soil."

"But," you ask, "How am I to know what elements of plant food are deficient in my soil?" The answer is not difficult. Almost all the soil in British Columbia is deficient in potash and in the majority of cases there is a shortage of Phosphoric Acid also. As for Nitrogen, if there is a strong leaf and foliage growth, if clover sod has been ploughed under, if heavy applications of stable manure have been made, or if the land is rich in decayed vegetable matter, it is probable that sufficient available Nitrogen is present. Light sandy loam, red loam and clay soils will usually respond to applied Nitrogen. In case of doubt simple experiments will settle the question, and are far more satisfactory than a soil analysis which is very often misleading.

As for the best materials, the farmer can make no mistake if he buys from a reputable firm, Nitrate of Soda, Muriate of Potash, Sulphate of Potash, Superphosphate of Lime, and Thomas Phosphate Powder (Basic Slag) as these commodities are uniform and true to analysis, and in fact are just as staple in the markets of the world as flour or sugar. It will be well to buy mixed fertilizers, provided these can be obtained from a firm who use no "make-weight" or "filler." It is very difficult to give even an outline of this subject within the space of a magazine article, bue it is hoped that the foregoing will serve as a basis of investigation and experimental work by the growers, and if this is accomplished the writer will feel that his poor effort has been amply rewarded.—Fruit Magazine.

The Threshing of Clover. How to Choose a Clover Huller.

In the earlier years of clover seed growing one of the principal difficulties was the threshing. There was no method known that would hull all the seed without leaving a large proportion of it in the heads and in the chaff. This has been the difficulty for years, and is still where the modern clover huller has not made its appearance.

The traveller will be quite astonished to find only a few clover hullers widely scattered over the Province of Quebec, where the climatic and agricultural conditions are so favorable to the production of clover seed that we could compete in this branch of agricultural production with any other part of the Dominion and even with the United States.

The farmer knows that a clover crop has no equal for maintaining and increasing the fertility of his land. He knows that in order to obtain a large crop he must sow a liberal quantity of seed, 8, 10, 12 lb. to the acre. He knows that the ensuing crop will almost every year yield a large quantity of seed of better quality than the one he generally buys from the trader. He knows that this home-grown clover seed doesn't cost him anything or very little. He knows all these things, but he usually neglects to save his clover seed crop; in most cases because HE DOESN'T KNOW HOW TO THRESH IT.

ORIGIN OF THE AMERICAN CLOVER HULLER.

Up to the years 1840 to 1850 the only means of threshing clover was flailing, which was long drudgery and a very incomplete method of securing but a small proportion of the seed. The heads then had to be separated from the straw by a second operation. Then by means of a third one the seed would be hulled by different methods of rubbing, each one slower than the other. Then the seed had finally to be cleaned with the fanning mill. No wonder that the price of clover seed was very high at that time, reaching about $28.00 a bushel. That is about double the price it is worth nowadays.

This deplorable state of afairs induced an intelligent and industrious farmer of New York State to study this question casefully, with the result that in the year 1855 he constructed and patented the first clover huller. This machine, while a decided improvement upon the methods then in use, was far from perfection and years of patient and intelligent work has been necessary to transform it into a modern clover huller.

It is quite logical that a farmer should first try to thresh his clover with a common grain thresher. But he will soon realize that the work is incompletely done and that the loss of seed does not warrant the use of such a machine, because of the small amount of hulled seed obtained; though special devices are adopted to increase the number of teeth on the cylinder and concave, or the blocking of the outlet of the drum, to force the clover to remain a longer time in the machine.

WHAT WILL A GOOD CLOVER HULLER PERFORM?

A good, modern clover should at the same time:—thresh the clover, separate the heads from the straw, hull the seed, clean the seed and sack it, ready for market.

HOW TO CHOOSE A CLOVER HULLER.

Therefore, the different parts of a clover huller must consist of:

First: A good, well built THRESHER, with cylinder and concave adjustable, and so constructed that the number of teeth can easily be changed, also bars put in instead of teeth, to suit the varying conditions of the clover, the bars to be used when the clover is exceedingly dry and brittle.

Second: A PICKER and SEPARATING TABLE OR TABLES, to separate the clover heads, loaded with seed, from the straw.

Third: A HULLER, which is the most important part of the machine. This huller should be of a "RASP" type, which experience has shown to be much superior to any other types, especially the teeth or the nail types.

The hulling cylinder and concave should be so finely adjustable as to hull the seed perfectly, without splitting any, and to permit the threshing of the different sizes of seed, such as red clover, with the same efficiency.

Fourth: A complete SYSTEM OF CLEANING AND RECLEANING THE SEED fitted with sieves of an appropriate motion and the meshes of which should be of appropriate shape and size.

Fifth: A complete system of smooth running ELEVATORS and CONVEYORS, to distribute the different parts of the clover, straw, heads, seed, chaff, tailings, etc., to the parts of the machine where they have to be worked upon, without loss or mixing.

ATTACHMENTS: While an AUTOMATIC or SELF-FEEDER is not an absolute necessity, all threshermen will agree that it is a great advantage to have it put on the huller, which it saves and preserves, prevent- THE THRESHING OF CLOVER etc. ing clogging of the cylinder and allowing the machine to run smoothly and regularly. Better work is also obtained from the machine. Anyone who knows the compact, bunchy nature of clover hay will understand that the construction of the self-feeder of a clover huller should materially differ from that of the self-feeder of a grain thresher. A fork system, tearing the bunches to pieces, will be more efficient than any other.

The AUTOMATIC CHAFF-BLOWER or WINDSTACKER also will be considered by threshermen a great time-saver and convenience. Here, again, it should materially differ in its construction, and especially in its position relative to the sieves of the recleaning apparatus, from the windstacker of the grain threshers. The clover seed being so small and light, the fan of the blower should be shielded in such a way as to prevent the seed being carried off the sieves with the chaff.

As far as general construction is concerned, in a clover huller solidity and rigidity of the frame should be combined with accurate finish, smooth running, easy and fine adjustment of the different parts, especially of the hulling cylinder and concave, and the cleaning apparatus.

TESTING DIFFERENT MAKES OF CLOVER HULLERS.

When the farmer who wants to buy a clover huller is not well acquainted with the different makes, or when the reputation of a good machine is not enough to guide him in his choice, he might resort to comparative testing of different machines.

In such cases he will remember that any grain threshing machine, even the poorest one, will thresh some seed out of clover hay, if there is any in it. But the merit and efficiency of a clover huller are to be judged; NOT FROM THE SEED OBTAINED BUT FROM THE CHAFF, which should be a negligible quantity, if any at all.

When testing different makes of clover hullers, care should be taken to

(Continued on page 720)

HORTICULTURE.

Apple Season.

By Berton Braley.

Getting near to apple-time,
Season best of all the year!
So I think at least, for I'm
One who holds that fruit most dear;
Weather's snappy, keen and clear,
Full of vim and glow and zest,
Makes you want to shout and cheer
Makes you feel a mortal blest,
That's the weather—apple-time.
And the apples—juicy, prime,
With their cheeks the rosiest, —
They'd stir anyone to rhyme!

Where's your other fruit can claim
Any such deserving fame?
Such a smack and such a tange,
Such a gastronomic thrill?
Let the other fruits go hang,
Only so I have my fill
Of the Pippin and the Snow
And the Baldwin and the Sweet
And the hundred sorts we know
Are the finest kind to eat;
Then, when autumn grows more chill,
Lead me to the cider-mill,
Where the juice that sparkles through
Has a zest and flavor, too,
High Olympus never knew.

Then it does me good to think
How this royal food and drink
Brings return none can compute
To the grower of the fruit;
Brings unto the farmer's hand
Streams of gold from every land;
Wherefore let the joy-bells chime,
As I give my thanks that I'm
Getting close to apple-time!

Fruit Growing in P. E. Island.

You have requested me to write you something concerning the fruit industry of P. E. Island. For some two years I have been a resident of P. E. Island and have made a somewhat careful observation of the fruit situation and am confident that there is a great future to this industry on P. E. Island. The unusual conditions for mixed farming which this Island affords has resulted in retarding the development of the fruit industry and not until the farmers of P. E. Island awake to their opportunities as intensive, rather than as extensive farmers, will there be much attention paid to fruit raising? At present, the average P. E. Island farm of about 120 acres is worked by about two men and wonders are derived from the soil considering the amount of cultivation bestowed upon it. When the P. E. Island farm of the future is reduced to from 20 to 40 acres and intensive methods of a farming pursued this million acre farm will become the wonder of the world for productiveness.

The past season witnessed a great crop of cherries throughout P. E. Island. The leading variety is what I knew in my boyhood days in the Annapolis Valley as the Old French Red cherry. The market being so limited, and the crop so enormous, a great many of these cherries perished on the trees. A canning factory, say at Summerside, would have utilized these cherries and made them a source of considerable income.

The strawberry crop promised to be good and was developing finely until, in the height of the season, the long continued rains came, and destroyed thousands of dollars worth of these luscious berries.

Little yet has been done in the cultivation of the raspberry and the blackberry, or other of the small fruits which may be grown in great abundance here.

There was an enormous crop of plums in sections of P. E. Island during the past season. Many varieties of plums are successfully cultivated here. I saw some trees loaded with plums as I never saw them elsewhere. Worthy of special note were a number of trees in the garden of Mrs. Alex. Laird, of North Bedeque, and a number more in the orchard of Albert Schurman, Esq., of Central Bedeque. The farm of Mr. Schurman had been chosen as a demonstration farm by the Federal Government, and if the conditions of plum culture can be maintained on this farm as shown during last season, it will give a great impetus to the culture of plums throughout the island province. The plums ripened well and were of excellent flavor.

Coming to the matter of apples I have to report a very chaotic condition of the industry. It is very evident that P. E. Island has been a favorite ground for the exploiting of the fag ends of nursery stock. Almost every farm has a small orchard of the most chaotic varieties. Very few of the trees imported have proved true to name. The great majority of the apples grown on P. E. Island are of the earlier varieties with poor keeping qualities and hence largely unmarketable. It remains to be demonstrated what are the varieties suitable for P. E. Island. Conditions of soil, atmosphere, and of prevailing wind in their relation to the growth of apples have yet to be studied here. Among the early varieties which I have noticed successfully grown here are the crimson Beauty, and judging from specimens of this apple that I have seen here, this apple is properly named, and the Yellow Transparent.

I have found a few trees of Gravensteins. These apples are, as grown here undersized. They were well colored and superior in keeping qualities to the Gravenstein of the Annapolis Valley. Probably more fertilizer and more cultivation would help out the size of this apple.

I have had Ribston Pippins grown by Mr. Albert Schurman of Central Bedeque, which for size, flavor, and keeping quality, surpass any of the same variety that I ever saw in Nova Scotia. The complaint against these apples is that so few of them mature.

I have Kings in my cellar at the present moment that will compare favorably with the run of Kings as I have known them in the Annapolis Valley. I am convinced that better cultivation will do wonders for this noble apple in P. E. Island.

I have also seen excellent Spys. Indeed, judging from the specimens of this variety that I have seen both on the tree and otherwise, I should say that it is a variety admirably adapted to the peculiar conditions of this province. I think the largest and finest looking specimens of this variety that I ever saw, I saw on a tree about three miles from Summerside.

I have been unable to determine, satisfactorily to myself, as to whether or not any of the Russet varieties are grown successfully in this province. The few specimens of them that I have seen have varied greatly as to the stage of maturity reached by them before they were taken from the tree. I am inclined to think that only under exceptional conditions will they mature to their best in the province.

When the varieties suited to cultivation in P. E. Island are determined and when proper methods of apple culture are introduced, I am of opinion that great things will be done in fruit culture in The Garden of the Gulf. Meantime this province imports many apples which might well be grown here—R. Osgood Morse, in The Maritime Apple.

Combining Poultry Raising and Fruit Growing.

Like a fairy tale reads the inscription "Make a small fortune in a few months raising fruit and poultry," but the exact nature of the case seldom comes to mind until an actual experiment has been tried. Many have the impression that all you have to do is to let your stock run at random through the orchards and that they will protect your fruit and in turn gain a livelihood without the proprietor's attention.

No doubt fruit and poultry do go well together, but existing circumstances have some control over the actual practice. There are few things that so appeal to any lover of nature as the sight of a fine old orchard sheltering and providing forage for numerous fowls, but special attention in selecting a fruit farm with the view of combining the raising of poultry thereto, is necessary if one is to realize the dreams of future success, and one of the first items of interest will be the nature of the orchard. An orchard of either young or old trees, it matters not materially which, will do alright so long as there are no other smaller fruits attached to the tract. Apples, pears, plums, peaches, quinces, etc., may be combined with poultry raising and success be naturally looked for; but when berries, currants and such small fruits are also numbered with the fruit inventory, there is going to be trouble sometime, and poultry raising and fruit-growing certainly will not harmonize for the benefit of the proprietor, although, of course, the chickens don't mind the situation in the least.

Nearly all so-called fruit farms are run on the mixed scale; a little of this and that and perhaps a specialty of some other kind of fruit, with the result that very seldom will one find a desirable location for poultry an agreeable spot in other ways.

For a man to say, as numbers continually do, "I intend to go into fruit and poultry," most usually signifies that he has very little idea of the actual necessities of either. It would be simply a waste of time and trouble for a man to plant an orchard and erect poultry houses with the idea that he is going to enjoy the situation in a year or so. Where the gradeur of poultry raising comes in is not out in the open at the mercy of the elements nor in the midst of a young orchard, but rather in the shelter of some grand old plantation that some one else has seen grow for years. There is where the true poultryman is content and finds enthusiasm running high.

THE BREED FOR THE FRUIT FARM.

Many will never question this phase of the subject at all; but, when you find Leghorns, Minorcas, Games, etc., climbing to the top of your peach trees after something nice and juicy as a change of diet, although perhaps they may have any quantity of fruit on the ground at their disposal, you will realize what it really means to consider the qualities of your fowl besides merely those in connection with eggs and meat.

Wyandottes, Rocks, Reds, Orpingtons, Houdans, Dorkings; these are the breeds for the fruit men to handle. A farm that is mostly in small fruits is no place for chickens and the runs of the Mediterraneans is no place for fruit of any sort; but take a flock of decently behaved fowls out under the spreading boughs of a good old apple tree, and what more could be desired.

SYSTEM A MOST NECESSARY ATTRIBUTE.

Without system the poultryman and fruit grower alike will not meet with the best results, and we may easily illustrate this in mentioning the methods necessary to keep pasture always before fowls. Many large poultry plants have adopted the habit of excluding a portion of the runs from the birds while some forage crop has time and chance to develop. Then turn the flocks in the orchard with this crop and the poultry have something besides a contaminated orchard ground to live on.

UTILIZING SHRUBBERY AND BRUSHES NOT BEARING FRUIT.

As much value may be derived from an orchard or vineyard of any kind for the young and growing chicks as for the regular pens. Place the hovers and colony coops out among the berry and currant bushes that are not bearing or are not in such a condition that the fruit may be attacked, and you have provided practically the

ARROW and NITRO CLUB SHOTSHELLS

CANADIAN made from our new factory at Windsor, Ontario.

Try Remington-UMC Arrow and Nitro Clubs this season. Their absolute reliability has made them the choice of sportsmen all over Canada. The highest priced ammunition sold in the Dominion. We have yet to find the keen sportsman who balks at paying the price.

Certain details of manufacture are a little more rigidly watched in Remington-UMC shotshells. May we send you a booklet simply explaining these and other technical points? Your name and address on a postcard will bring it by return mail. 7

Remington Arms-Union Metallic Cartridge Co., Windsor, Ontario

best place imaginable for developing chicks. Worms and insects will attack the bushes, and no better playground for young chicks or mature fowls could be desired than such a place that gives green food and meat, shade and scratching ground all through the season. A grapery is also a splendid place for little chicks, but it is too much of a paradise for older fowls.

In conclusion we wish to state to the contemplating fruit-poultry man that, to realize one's fine dreams of a homelike poultry and fruit farm, it is necessary to start with an orchard of fair sized trees having no smaller fruits growing between the rows. If you can't do that, you will wait ten years before having what you really desire and, as we all know, many things may happen in that length of time.—By R. Ballantyne, Grimsby, Ont.

Instructions for Canning.

The most important things in the preservation of foods are the sterilization of the foods and all the utensils and the sealing of the food to exclude all the bacteria. Everywhere on the earth and floating in the air are germs. These bacteria are the cause of the spoiling of our fruits and vegetables. When we can anything we simply kill the bacteria in it and let no more get in. Heat is applied to kill all the bacteria present and the sealing prevents more from coming in. To sterilize the utensils, put the spoons, jars, covers and such other articles as are to be used over the fire in cold water, heat gradually to the boiling point, and then boil 10 or 15 minutes.

When your garden is planted you should begin to think about the method of canning. If you expect to can for the market, or even for home use, you should engage the cans now and not wait until your crop is ready. In using glass jars it is recommended that you use jars of uniform size. Any device for heating and sealing will constitute a canning outfit. Two large pans and a kitchen stove, together with a tipper and capper, make a good small outfit. A larger outfit may consist of a wash boiler or zinc tub placed over a furnace used for heating. This boiler should have some wooden slats in the bottom. An open earthen vessel and charcoal make a good heater for the canning steel and tipper. Hot water canners are cheaper than steam pressure canners. The steam pressure canner will sterilize more quickly and easily, as a higher degree of heat can be obtained.

Fruit for canning should be fresh, ripe and of good quality. Blanching or dipping means immersing the vegetables or fruit to be canned in boiling water. This is done for the purpose of eliminating certain acids and bitter substances which, if they are allowed to remain in the vegetables, will spoil the flavor. Blanching should never be omitted when specified in the formula. To remove the skins from tomatoes, place in a wire basket or flour sack and suspend in boiling water until the skins loosen. Take from the water and remove skins. Peaches may be peeled by using concentrated lye. In using this method peaches must be firm. To every four and one-half gallons of water add one-half pound of lye and one-half tablespoonful of alum. Heat water until it begins to boil. Put the peaches in a wire basket or sack and let them down into the water, raising and lowering the basket rapidly until the peeling will slip. Wash skins off in clear, cool water. Do not cook in open pans, but put raw fruit in cans or jars. Add syrup if necessary and coak as follows:

To exhaust means to heat the cans after they have been filled, but before they have been canned. This is done to allow for expansion or shrinkage.

To process means to cook and sterilize in the cans after they have been filled, capped and tipped. The time required for processing varies with the kind of fruits and vegetables used. Some bacteria are easily killed and others are not. Those on most fruits and tomatoes are easily destroyed, while those on vegetables containing starch, such as beans, peas and corn are hard to kill. For berries, peaches and tomatoes, process from 15 to 25 minutes in boiling water; for peas and corn, process for three hours each day for three consecutive days. Under 10 pounds of steam pressure about half the time is required for processing. If glass jars are used, screw the lids on airtight as soon as jars are taken from the canner. Great care should be taken in storing canned goods. Putting the same kind of goods to themselves and labelling is a matter that should not be overlooked.

Tent Caterpillars.

Tent-caterpillars are very numerous this season, as the bracket-like egg-masses laid by the female moths last July on the twigs of orchard and shade trees were much in evidence in the districts which suffered from their attacks last year. It was hoped that many of these eggs would be killed by minute parasitic flies, but examination shows that but few parasites are present.

As each bracelet contains between 200 and 300 eggs there will issue in May a colony of from 200 to 300 caterpillars from every bracelet of eggs. Each colony constructs a silken-webbed tent at a crotch formed by two branches, and continues feeding on the leaves for 3 or 4 weeks. Then each caterpillar makes a yellowish white oval cocoon within which it changes to a pupa. Two or three weeks later the moths emerge to lay their eggs. These eggs remain on the twigs all winter for there is but one brood in a season.

There are two kinds of tent-caterpillars—the "Orchard tent-caterpillars" which form the tents described above, and the "forest tent-caterpillars" which do not form a tent, but collect on the trunks of trees in large clusters. These may also be distinguished from the former by the broken white line along the middle of the back.

HOW THEY MAY BE CONTROLLED

1. In early May before the eggs hatch the bracelet-like egg-masses may be readily taken off the twigs and destroyed. In the case of orchard trees this task is not a heavy one With a ladder and a pair of sharp eyes hundreds of the egg-masses can be removed. In my opinion this is the cheapest and most effective method of control for orchards.

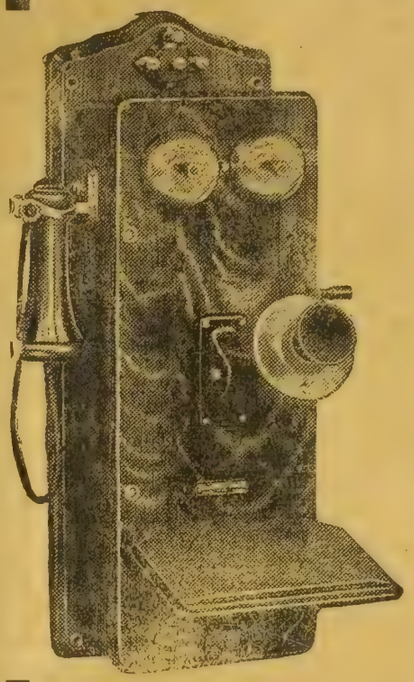
2. As soon as the tents appear on the twigs they may be removed by means of poles with swabs attached to their ends, and the caterpillars killed either by burning them in place or bringing them to the ground.

3. If caterpillars become very numerous it may be necessary to spray the trees with a strong arsenical poison such as Paris Green, or preferably Arsenate of Lead. (2-3 lbs. to 40 gallons of water). The smaller the caterpillars the more susceptible they are to the poison. Full grown caterpillars are very difficult to kill in this way.

When the forest caterpillars collect in masses on the trunks they may be brought down by means of a hoe, collected in a bucket and destroyed.

4. Trees free from caterpillars may be kept free from migrating caterpillars by applying bands of tangle-foot to the trunks.

Independent Systems Constantly Growing



THE number of municipal, government and independent local telephone systems in Canada is constantly growing. The independent telephone movement in spite of tremendous opposition, is a huge success. If your locality is without telephone service, write us and we will tell you the steps to take to organize an independent telephone system.

We are the largest Indepent Telephone Manufacturers in Canada. We carry complete stocks of guaranteed telephone materials, and can make shipment within 24 hours after receipt of order. Our telephones are superior to others in design, material and workmanship Send for Free Trial so that you can test and compare them with others.

Write for our No. 3 Bulletin—the latest book on telephones. Tells how to build a telephone line. A very interesting and informing book.

DAIRYING.

Pointers in Purchasing Dairy Cattle.

Under the above heading Prof. W. B. Richards of the North Dakota Agricultural College, gives advice to the farmers of his state, which is generally applicable to farmers of other sections.

If one desires to buy pure bred dairy cattle, or good grade cows, and is not familiar with the characteristics or points of the breed of what constitutes a good milking type, it would be advisable and profitable for him to secure the services of some one who knows to help select the stock. If this is possible, try and buy only from breeders of good repute. There are all degrees of merit among the individuals of the different breeds. Make careful inquiries as to the reputation of the breeders from whom you buy pure bred cattle. Buy from a breeder rather than a dealer. There are a large number of dealers in the business of vending pure breds, who can not be relied upon as generally as the breeders.

DISEASES TO AVOID.

Tuberculosis is quite prevalent in all dairy cattle sections, and great care should be exercised not to buy cattle infected with the disease. A good method to follow to make sure that the cattle are clear is to have them removed immediately to some central point where you can test them yourself, or have a competent veterinarian of your own selection do it for you. Purchase them on the condition of acceptance if they pass the tuberculin test. Removing them from the premises of the seller at once will help obviate the seller from injecting tuberculin into them, which interferes with the reliability of the regular test. Do not accept a certificate covering the test for any animal even though it is made within thirty days unless it is accompanied with a guarantee, or unless you know the veterinarian who issued the certificate to be absolutely reliable.

Contagious abortion is also very prevalent in most of the dairy districts of this country; consequently cows that are infected or have been exposed to the diseases should be avoided. There is no practical test for this trouble, so one is largely at the mercy of the seller as to whether he gets cattle clean or not. One way to avoid it is to find out how many heifers the seller has in his herd; demand to see them. If there are but few on hand in proportion to the number of cows in the herd, it is wise not been able to raise any because of contagious abortion. Few good breeders of dairy cattle sell their heifers before they test them out for production.

My advice to the farmers of North Dakota, under present conditions, is not to buy any more cows than necessary to make a legitimate start, but make the best use of the cows that are on hand. Keep every cow that is capable of raising a calf. Rather inferior cows bred to a good, pure dairy sire will produce some heifers that will make as good a grade of cows as can be bought at the present time in the dairy districts unless an exorbitant price is paid for them.

Starting a Creamery.

In a recent bulletin published by the dairy department of the University of Nebraska, the question of how to raise money to start a creamery is discussed as follows:

"The most satisfactory way of raising the money is for each member to sign an agreement and to be jointly responsible for the amount borrowed. When such an agreement is signed by a goodly number of responsible farmers, the money can generally be secured at a reasonable rate of interest, and with this money a creamery can be erected and equipped. As soon as the creamery begins operation, arrangements can be made for the deduction of one or two cents per pound of butter to go into a "sinking fund" out of which the debt is paid. The payment is so gradual that the farmer hardly notices it. This plan has the advantage of requiring each patron to pay exactly in proportion to the amount of butter manufactured for him."

Judging Butter.

Nearly every one thinks he can judge a sample of butter and it is true that all are able to compare butter from an individual standpoint. However, to judge butter for the commercial taste requires considerable experience. The standard used exclusively in this country for scoring butter is as follows:

Flavor	45 percent.
Body	25 percent.
Color	15 percent.
Salt	10 percent.
Style	5 percent.

Flavor is valued at nearly half the total. A judge must have a keen and sensitive taste and must also know the flavor that is demanded in the market. Some of the common faults in flavor are designated as "flat," "fishy," "rancid," "weedy," "old cream," "acid" and "stable." Flavor is due to the previous methods of handling the cream.

Body refers to the texture or grain of the butter. It should be firm and waxy. Criticisms of body are "greasy," "tallowy," "cloudy," "brisky," "salvy." Texture is determined by the methods of manufacture. That is, by the churning, washing, working and salting.

The color should be bright and even. The most common fault in the color of butter is "mottled" or wavy butter. Most consumers can detect small differences of the salt content of butter. This is liable to be confused with flavor.

The amount of salt should be suited to the market and is not critised in the judging as much as its condition in the butter. It should be thoroughly dissolved and entirely distributed.

Style refers to the clean and neatly finished appearance of the butter and its package.

New Zealand Dairying.

New Zealand butter is weekly shipped to Great Britain in enormous quantities, on which market it has for years past brought top prices, being beaten only by the Danish. It is graded by government dairy experts and is packed in boxes containing 56½ lbs., the extra half pound being allowed for evaporation; but as each box is lined with deodorized waxed paper evaporation must be infinitesimal. In no country in the world, excepting Denmark, is the dairy industry carried on so scientifically as in New Zealand. Milking machines are in general use and buildings are maintained in perfect order and cleanliness, as are the animals themselves, all being regularly inspected by the dairy officials, who, instead of being a bugbear to the farmer, are welcomed by him, the intelligent dairyman fully recognizing the value of the great assistance tendered in his interests by the government. Shorthorns are one of the favorite breeds, being well-known for their good milking qualities and for their cheque-raising power as beef.

IMPROVE the sanitary conditions in and about your home. Safeguard the health of your family and lessen the labor of household duties by installing

A Record Foundry & Machine Co. System of Water Supply

Pure water under pressure always on tap in kitchen, bathroom, laundry, etc.

Installation cost reasonable; operating cost but a trifle. Outfit shown is easily set up in basement of ordinary residence and is easily operated by hand, a few strokes of the lever once a day being generally sufficient.

From our complete line you can select an outfit especially adapted to your need.

It affords absolute fire protection as well. For further information write the

Record Foundry & Machine Co., Moncton, N. B.

Handling the Soiling Crops.

The most economic way of feeding soiling crops is to cut and feed immediately. Soiling crops that are cut left lying on the ground dry out, and lose their succulence and palatability. It does not entail a great deal of time to hitch unto the mower once every day and cut what will be required in the next 24 hours. In the case of cutting rape or pease and oats for hogs, the scythe may be used advantageously just before feeding at each end of the day. This same means of cutting may be used in feeding horses.

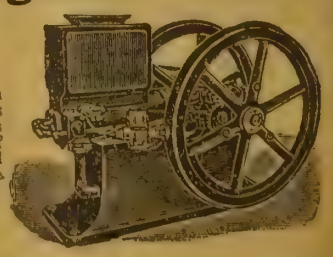
Soiling crops should be raked up with either a revolving rake or else a wide tongued fork. A light, curved toothed rake passes over the top of most of the heavy swath and calls forth emphatic language from the operator.

In hauling these crops from field to place of feeding, a low wagon with a wide long rack on it should be used. The weight of soiling crops is so great that it is unwise to lift them into a rack that is more than two feet six inches high. In having a rack of a large area, the load does not have to be built up high before the horses will have a full load to draw.

Feeding soiling crops in the stable gives each animal a fair chance and provides them with more comfortable quarters for feeding in when the flies are bad. On the other hand, when the stuff is fed outside there is less trouble feeding, and less stable cleaning. When it is fed in the field a clean place should be selected each day. Always strive to feed what the stock will eat up clean.

Keeping salt where the dairy cows can reach it at all times, maintains their good health and encourages a heavy milk-yield by promoting thorough digestion and assimilation and having a cooling effect on the whole system of the animals, at the same time making it easier to bring butter of a superior colour and flavor at churning time. ...

"Monarch" Engines Save Running Cost



"MONARCH" Engines give more power than their rating, yet use no more fuel. This is due to good material and design. The fuel tank is one solid piece, preventing leakage. Every drop of "Monarch" fuel gives a return in power, and full power at that. It pays to get a "Monarch". The "Monarch" pays for itself by saving fuel.

Should be a Premium Upon Tested Dairy Cattle.

The present demand for dairy cattle is not without its attendant dangers. As is well known, dairy cattle are often infected with tuberculosis, and the farmer who, in gathering up the nucleus of a dairy herd, introduces into it an animal affected even in a latent way with this disease in storing up plenty of trouble for himself later on.

Because of the danger, some of the agricultural experts of the Northwest have been advising—very wisely we think——that buyers of dairy cows should purchase them subject to tuberculin testing.

There is a good trade open today to the dairy breeder who, knowing that he has no tuberculosis in his own herd, guarantees in his advertising and other announcements that he will guarantee all animals sold to pass the tuberculin test.

Ripening Cheese With Electricity.

Recently an electrician in Holland has found a way of ripening a cheese in 24 hours by passing an alternating electric current through it for the period mentioned. The New York Journal of Commerce describes the invention thus:

"Another use has been found for electricity, that of aging cheese: An industrious electrician of Rotterdam, Holland, through a long series of experiments, found that he could take an absolutely fresh cheese and in one day actually "age" it two years. In other words, by means of electricity he would make this fresh cheese have all the consistency, taste, and appearance of a fine cheese that had been stored away and carefully aged for two years. He takes a fresh cheese and subjects it to an alternating current. At the end of 24 hours of constant alternating electrical currents through this cheese it possesses all the properties of a fine two-year-old cheese.

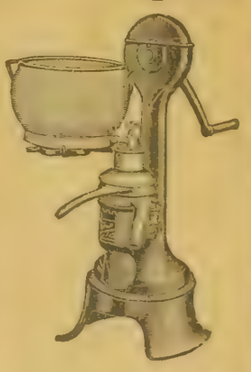
Milking.

The art or science of milking, which ever it may be called, can be successfully attained only by those who are willing to study each individual cow which they have to milk; her disposition, temperament, and peculiar characteristics must all be considered. The most important things to keep in mind are: first, maintain an absolute quietness around the cows; second, milk with clean, dry hands; third, milk quickly; fourth, milk completely; fifth, milk at regular hours each day; sixth, use five fingers, not the thumb and index finger; seventh, milk with gentleness; eighth, milk three times a day when testing the cow as a producer; ninth, do not interrupt the milker unless absolutely necessary, and tenth, have the same man milk the same cow each time.

There are right and also there are wrong ways of cleaning dairy utensils. There is in milk a substance, albumen, which resembles the white of an egg, and hot water will cook this on the tin. Hence a utensil that has been holding milk or whey should first be rinsed with cold or lukewarm, not hot, water; then washed with hot water containing some good washing powder, and then scalded with boiling water or steam, after which it should be placed in a pure atmosphere, in the sunlight, and in a position to drain. Sunlight is the great natural disinfectant. Use a good fibre brush, and not a cloth, in washing dairy utensils, and never wipe them out after scalding but allow their heat to dry them.

THE SUSSEX MOTOR CO'S

Cream Separators and Engines



are the best and we do not believe that there is a sensible man living who would purchase any other than our cream separators and engines, if he would but see and try our machines. It is a fact that 99% of all separator and engine buyers who do SEE and TRY our machines before buying, purchase our goods and will have no other. The 1% who do buy are those who allow themselves to be influenced by something other than real genuine merit.

LIVE STOCK.

Quack Theories in Animal Breeding.

There are two principal benefits to be derived from a careful study of a good modern book on animal breeding, such as Prof. F. R. Marshall's "Breeding Farm Animals." It gives the reader greater confidence in the power of selection to modify and fix the types of animals, and it destroys belief in what may be termed the quack theories of animal breeding. By quack theories are meant: (1) mother-marking, or the power of the dam's mental impressions to affect the developing embryo; (2) the power of previous matings of either the sire or dam to affect the embryo; (3) theories of sex control; (4) the inheritance of acquired characters. Such notions have been given much credence in the past, and even today are believed by a large number of people.

There is positively no path by which the mental impressions of the mother may reach the embryo. Yet today in hundreds of instances mares are no sooner bred than they are wheeled about in order that they may get a good look at the stallion in the hope that the mental picture may in some way affect the embryo and result in a foal similar in type and color to the sire. Buildings and fences have been painted the color desired in calves, and in many instances or unusual characters in both men and animals have been explained on the basis of some mental impression supposed to have been made upon the mother during pregnancy. Some of these explanations have been ingenious, and have been rather generally accepted in the communities where the unusual results occurred.

Every case of the mother-marking which has been investigated has admitted of just as satisfactory an explanation on grounds strictly in keeping with the facts of embryology. It is true that extreme fright may affect the nutrition of the embryo for a time, and even at certain stages of pregnancy result in abortion, but the assumption that color of hair, shape of head, or any other character is dependent upon mental impressions seems absolutely beyond the range of possibility. The relation of the dam to the embryo is three-fold: she supplies nourishment, warmth and protection. It is as easy to influence the kind of corn a soil will produce by showing the soil a picture of the corn desired as it is to produce good live stock by regulating the mental states of the dams.

The second quack theory claims that when once a female has borne offspring to the service of a certain male, all her subsequent offspring will by affected by the first mating or matings. Dog fanciers seem to have been most strongly imbued with this idea. If a valuable bitch chanced to get in whelp to a cur dog, her value as a breeder was thought to be destroyed for all time, because a supposed taint from the cur litter affected later litters sired by dogs of her own breed. It was supposed that she could never again produce strictly pure-bred puppies, no matter how mated. As a matter of fact, a bitch bred to a cur dog is no more injured for future breeding purposes than an incubator used for eggs from grade or common poultry is rendered useless for hatching eggs from pure-bred fowls. The dam of Star Pointer 1:59¼ produced two mule colts before she foaled the famous pacer. Most dog breeders now believe this thoery to be of the quack order and no longer destroy bitches which accidently produce a litter by a cur dog. Writing of incubators reminds me of some nonsense in an article in a poultry journal some years ago in which it was stated that a setting of eggs of any breed could not be hatched into strictly pure-bred chickens unless the eggs were set under a pure-bred hen of the same breed.

From time to time theories of sex control have been advanced. Some credit the phase of the moon at the time of fertilization with being the sex determiner. Other theories claim that males result if the dam is poorly fed during pregnancy; females, if the dam is well fed. Another equally valuable theory says that germ cells from the right testicle get males and from the left females. There is a similar theory in regard to the ovaries. Some breeders have attempted to control sex by adopting some such method as those mentioned, not always without success.

Within the last few years scientists have discovered and proved that sex in mammals and some insects and worms is controlled by the male germ cell which unites with the female germ cell in fertilization. Exactly half of the germ cells (spermatozoa) of a stallion or bull contain a certain element which in the other half of the spermatozoa is entirely lacking. This Element is present in all of the female germ cells (ova). When an ovum is fertilized by a spermatozoan containing this sex determiner the result is always a female. When the spermatozoa does not contain this element the result is always a male. The chances of getting a bull calf are thus exactly equal to those of getting a heifer calf, and that is why the two sexes appear in equal number the world over. In several species of animals this sex determiner (scientists call it the accessory or X chromosome) may be plainly seen in the germ cells and body cells by the use of a high-power microscope. Sex is determined at the moment of fertilization and is entirely beyond the control of the breeder.—Henry W. Vaughan, Ohio State University in Breeders Gazette.

Sheep Breeding Company Organized at Middleton, N. S.

The raising of sheep and fur bearing animals is the object of a company lately organized in Middleton, N. S.

E. T. Neily, the promoter, has been working quietly upon the scheme for several months.

In April a charter was ontained for the Middleton Sheep and Fur Co., Limited, with authorized capital of $30,000. At first only $10,000 of stock was offered, which has been subscribed. Now it has been decided to offer the balance of the stock.

The officers of the company are: Dr. S. N. Miller, president; Coun. J. H. Charlton, vire-president; J. R. Allen, secretary treasurer and E. T. Neily, Managing director. The other directors are; A. W. Allen, Mayor O. P. Goucher, and Dr. F. S. Messenger.

About 400 acres of ,and have been acquired. Nearly 200 acres of this purchased from E. T. Neily, C. H. Wright and Isaac Moore lies along the projected highway from the Dodge Road to the Morse Road and the balance is mountain land.—Middleton Outlook.
